This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement

between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

CONTENTS

CHAPTER 1 About Oracle Cloud Infrastructure 16
Prefer Online Help? 18
Need API Documentation? 18

CHAPTER 2 Service Essentials 19
Security Credentials 20
Regions and Availability Domains 22
IP Address Ranges 29
Resource Identifiers 35
Resource Tags 39
Resource Monitoring 44
Service Limits 60
Console Announcements 78
Prerequisites for Oracle Platform Services on Oracle Cloud Infrastructure 86
Billing and Payment Tools Overview 99
Console Cookies and Local Storage 112
My Services Use Cases 115

CHAPTER 3 Archive Storage 168
Overview of Archive Storage 168

CHAPTER 4 Audit 174
Overview of Audit 174
Contents of an Audit Log Event 175

Viewing Audit Log Events ... 180
Setting Audit Log Retention Period ... 185
Bulk Export of Audit Log Events ... 186

CHAPTER 5 Block Volume ... 191

Overview of Block Volume ... 191
iSCSI Commands and Information ... 199
Volume Groups ... 200
Creating a Volume ... 212
Attaching a Volume ... 214
Connecting to a Volume ... 220
Listing Volumes ... 229
Listing Volume Attachments ... 231
Listing Boot Volume Attachments ... 232
Renaming a Volume ... 233
Resizing a Volume ... 234
Overview of Block Volume Backups ... 243
Backing Up a Volume ... 252
Policy-Based Backups ... 254
Copying a Volume Backup Between Regions ... 258
Restoring a Backup to a New Volume ... 262
Cloning a Volume ... 264
Disconnecting From a Volume ... 268
Detaching a Volume ... 269
Deleting a Volume ... 271
Block Volume Performance ... 272
Block Volume Metrics ... 291

CHAPTER 6 Compute ... 295

Overview of the Compute Service ... 295
Best Practices for Your Compute Instance ... 300
Protecting Data on NVMe Devices ... 312

Boot Volumes ... 324
Oracle-Provided Images ... 362
Compute Shapes ... 378
Installing and Running Oracle Ksplice ... 384
Managing Custom Images ... 386
Image Import/Export ... 396
Bring Your Own Image (BYOI) ... 403
OS Kernel Updates ... 424
Managing Key Pairs on Linux Instances ... 427
Creating an Instance ... 430
Managing Compute Instances ... 444
Autoscaling ... 459
Connecting to an Instance ... 468
Instance Console Connections ... 473
Adding Users on an Instance ... 482
Displaying the Console for an Instance ... 485
Getting Instance Metadata ... 486
Updating Instance Metadata ... 488
Renaming an Instance ... 491
Moving a Compute Instance ... 491
Migrating an Instance from a Local to Remote Boot Volume ... 498
Stopping and Starting an Instance ... 502
Terminating an Instance ... 506
Enabling Monitoring for Compute Instances ... 508
Compute Metrics ... 522
Compute Performance ... 533
Compute Health Monitoring for Bare Metal Instances ... 536

CHAPTER 7 Container Engine for Kubernetes ... 540
Overview of Container Engine for Kubernetes ... 540
Preparing for Container Engine for Kubernetes ... 542
About Kubernetes Clusters and Nodes ... 577

Creating a Kubernetes Cluster ... 579
Downloading a kubeconfig File to Enable Cluster Access ... 588
Modifying a Kubernetes Cluster ... 591
Deleting a Kubernetes Cluster ... 593
Monitoring Clusters ... 594
Monitoring Operations of Container Engine for Kubernetes ... 597
Accessing a Cluster Using kubectl ... 598
Starting the Kubernetes Dashboard ... 598
Deploying a Sample Nginx App on a Cluster Using kubectl ... 599
Pulling Images from Registry during Deployment ... 601
Connecting to Worker Nodes Using SSH ... 603
About Access Control and Container Engine for Kubernetes ... 606
Kubernetes Versions and Container Engine for Kubernetes ... 611
Creating Load Balancers to Distribute Traffic Between Cluster Nodes ... 618
Creating a Persistent Volume Claim ... 624
Adding OCI Service Broker for Kubernetes to Clusters ... 628
Example: Setting Up an Ingress Controller on a Cluster ... 630

CHAPTER 8 Data Transfer ... 640
Overview of Data Transfer Service ... 640
Data Transfer Disk ... 641
Data Transfer Appliance ... 647
Preparing for Data Transfer ... 654
Installing and Configuring the Data Transfer Utility ... 657
Managing Disk Data Transfers ... 665
Managing Appliance Data Transfers ... 692

CHAPTER 9 Database ... 734
Overview of the Database Service ... 734
Exadata DB Systems ... 737
Bare Metal and Virtual Machine DB Systems ... 845
Overview of Autonomous Database ... 1123

Migrating Databases to the Cloud 1153
Troubleshooting 1216

CHAPTER 10 Edge Services 1245
Overview of the DNS Service 1245
Overview of the Health Checks Service 1275
Overview of the Traffic Management Steering Policies Service 1291
Overview of the Web Application Firewall Service 1341

CHAPTER 11 Email Delivery 1419
Overview of the Email Delivery Service 1419
Generate SMTP Credentials for a User 1426
Managing Approved Senders 1427
Configure SPF 1429
Configure SMTP Connection 1430
Managing the Suppression List 1432
Deliverability Best Practices 1434

CHAPTER 12 File Storage 1440
Overview of File Storage 1440
About Security 1447
Creating File Systems 1469
Mounting File Systems 1482
Managing File Systems 1513
Managing Mount Targets 1528
Managing Snapshots 1565
Paths in File Systems 1571
Troubleshooting Your File System 1573

CHAPTER 13 IAM 1593
Overview of Oracle Cloud Infrastructure Identity and Access Management 1593
Getting Started with Policies 1609
How Policies Work 1612

Common Policies ... 1622
Advanced Policy Features ... 1642
Policy Syntax ... 1647
Policy Reference ... 1653
User Credentials ... 1831
Federating with Identity Providers ... 1834

Route Tables 2473
Dynamic Routing Gateways (DRGs) 2484
VPN Connect 2492
VPN Connect Overview 2493
Supported IPSec Parameters 2505
Setting Up VPN Connect 2506
Configuring Your CPE 2541
Verified CPE Devices 2665
Working with VPN Connect 2666
VPN Connect FAQ 2676
Using the API for VPN Connect 2677
VPN Connect Troubleshooting 2679
FastConnect 2690
FastConnect Overview 2690
FastConnect Requirements 2706
FastConnect: With an Oracle Provider 2712
FastConnect: With a Third-Party Provider 2733
FastConnect: Colocation with Oracle 2759
FastConnect Troubleshooting 2783
Internet Gateway 2786
NAT Gateway 2796
Access to Oracle Services: Service Gateway 2805
Access to Other VCNs: Peering 2822
Local VCN Peering (Within Region) 2826
Remote VCN Peering (Across Regions) 2849

Access to Oracle Cloud Infrastructure Classic ... 2865
Connection Over Oracle Network ... 2866
Connection Over IPSec VPN ... 2875
Access to Other Clouds with Libreswan ... 2883
Network Performance ... 2899
Networking Metrics ... 2901
Troubleshooting ... 2909

CHAPTER 19 Notifications ... 2921
Notifications Overview ... 2921
Managing Topics and Subscriptions ... 2925
Publishing Messages ... 2932
Notifications Metrics ... 2934

CHAPTER 20 Object Storage ... 2939
Overview of Object Storage ... 2939
Understanding Object Storage Namespaces ... 2945
Managing Buckets ... 2947
Managing Objects ... 2968
Copying Objects ... 2988
Using Pre-Authenticated Requests ... 2996
Using Multipart Uploads ... 3005
Using Object Lifecycle Management ... 3011
Object Storage Metrics ... 3022
Hadoop Support ... 3026
Designating Compartments for the Amazon S3 Compatibility and Swift APIs ... 3027
Amazon S3 Compatibility API ... 3031

CHAPTER 21 Registry ... 3035
Overview of Registry ... 3035
Preparing for Registry ... 3037
About Images ... 3039
About Repositories ... 3039

Creating a Repository ... 3040
Pushing Images Using the Docker CLI ... 3041
Pulling Images Using the Docker CLI ... 3046
Pulling Images from Registry during Kubernetes Deployment ... 3048
Viewing Images and Image Details ... 3050
Deleting an Image ... 3052
Retaining and Deleting Images Using Retention Policies ... 3052
Deleting a Repository ... 3059
Getting an Auth Token ... 3060
Policies to Control Repository Access ... 3060

CHAPTER 22 Overview of Resource Manager ... 3064
Authentication and Authorization ... 3065
Tagging Resources ... 3065
Key Concepts ... 3066
Generalized Workflow ... 3069
Using Resource Manager in the Console ... 3071
Using Resource Manager with the CLI ... 3082
Using Remote Exec ... 3092
Sample: Creating a Compute Instance Using Resource Manager ... 3096

CHAPTER 23 Search ... 3112
Overview of Search ... 3112
Search Language Syntax ... 3115
Sample Queries ... 3124
Querying Resources ... 3128
Troubleshooting Search ... 3134

CHAPTER 24 Security Guide and Announcements ... 3136
Oracle Cloud Infrastructure Security Guide ... 3136
Oracle Cloud Security Response to Intel L1TF Vulnerabilities ... 3249
Oracle Cloud Security Response to Intel Microarchitectural Data Sampling (MDS) Vulnerabilities ... 3258

CHAPTER 25 Storage Gateway 3270
Overview of Storage Gateway 3270
Features of Storage Gateway 3278
Getting Started With Storage Gateway 3281
Configuring the Cache for File Systems 3282
Understanding Storage Gateway Performance 3290
Interacting With Object Storage 3293
Installing Storage Gateway 3297
Logging In to the Storage Gateway Management Console 3310
Creating Your First File System 3312
Managing File Systems 3318
Managing Storage Gateway 3330
Using Storage Gateway File Management Operations 3335
Monitoring Storage Gateway 3342
Using Storage Gateway Cloud Sync 3346
Best Practices for Using Storage Gateway 3354
Troubleshooting Storage Gateway 3354
Upgrading Storage Gateway 3358
Uninstalling Storage Gateway 3365
Getting Help with Storage Gateway 3367
CHAPTER 26 Streaming Service Overview 3369
Streaming Usage Scenarios 3369
Streaming Concepts 3369
How Streaming Works 3371
Limits on Streaming Resources 3372
Resource Identifiers 3372
Ways to Access Oracle Cloud Infrastructure 3373
Using Streaming 3373
Authentication and Authorization 3373
Tagging Resources 3374
Managing Streams 3374

Publishing Messages ... 3377
Consuming Messages ... 3378
Using the Streaming SDK ... 3381
Streaming Metrics ... 3390

Software Development Kits and Command Line Interface ... 3399
Other Tools and Plug-ins ... 3469
Tools Configuration ... 3550
REST APIs ... 3560

GLOSSARY ... 3651

RELEASE NOTES ... 3672

CHAPTER 1 About Oracle Cloud Infrastructure

Oracle Cloud Infrastructure provides bare metal cloud infrastructure that lets you create networking, compute, and storage resources for your enterprise workloads.

If you're new to Oracle Cloud Infrastructure and would like to learn some key concepts and take a quick tutorial, see the *Oracle Cloud Infrastructure Getting Started Guide*.

If you're ready to create cloud resources such as users, access controls, cloud networks, instances, and storage volumes, this guide is right for you. It provides the following information about using Oracle Cloud Infrastructure:

Service	What's Covered	Chapter
Archive Storage	Preserving cold data.	Archive Storage
Audit	Logging activity in your cloud.	Audit
Block Volume	Adding storage capacity to instances.	Block Volume
Compute	Launching compute instances and connecting to them by using an SSH key pair.	Compute
Container Engine for Kubernetes	Defining and creating Kubernetes clusters to enable the deployment, scaling, and management of containerized applications.	Container Engine for Kubernetes
Data Transfer	Migrating large volumes of data.	Data Transfer
Database	Launching DB Systems and managing Oracle databases.	Database

Service	What's Covered	Chapter
Edge Services	Encompasses several services that allow you to manage, secure, and maintain your domains and endpoints.	Edge Services
Email Delivery	Sending large volume email.	Email Delivery
File Storage	Managing shared file systems, mount targets, and snapshots.	File Storage
IAM	Setting up administrators, users, and groups and specifying their permissions to access to cloud resources.	Key Management
Key Management	Creating and managing encryption keys and key vaults to control the encryption of your data.	Key Management
Load Balancing	Setting up load balancers, listeners, backend sets, certificate bundles, and managing health check policies.	Load Balancing
Monitoring	Querying metrics and managing alarms to monitor the health, capacity, and performance of your cloud resources.	Monitoring
Networking	Setting up cloud networks, subnets, gateways, route tables, and security lists.	Networking
Notifications	Setting up topics and subscriptions, and publishing messages.	Notifications

Service	What's Covered	Chapter
Object Storage	Creating and managing buckets to store objects, and uploading and accessing data files.	Object Storage
Registry	Storing, sharing, and managing development artifacts like Docker images in an Oracle-managed registry.	Registry
Search	Searching for Oracle Cloud Infrastructure resources using free text search or advanced queries.	Search

For a description of the terminology used throughout this guide, see the GLOSSARY.

Prefer Online Help?

The information in this guide and the *Getting Started Guide* is also available in the online help at https://docs.cloud.oracle.com/iaas/Content/home.htm.

Need API Documentation?

For general information, see REST APIs. For links to the detailed service API documentation, see the online help at https://docs.cloud.oracle.com/iaas/Content/home.htm.

CHAPTER 2 Service Essentials

The following topics provide essential information that applies across Oracle Cloud Infrastructure.

Security Credentials

The types of credentials you'll use when working with Oracle Cloud Infrastructure.

Regions and Availability Domains

An introduction to the concepts of regions and availability domains.

Resource Identifiers

A description of the different ways your Oracle Cloud Infrastructure resources are identified.

Resource Tags

Information about Oracle Cloud Infrastructure tags and how to apply them to your resources.

Service Limits

A list of the default limits applied to your cloud resources and how to request an increase.

Console Announcements

Information about the announcements that occasionally appear in the Oracle Cloud Infrastructure Console

Prerequisites for Oracle Platform Services on Oracle Cloud Infrastructure

Instructions for setting up the resources required when running an Oracle Platform Service on Oracle Cloud Infrastructure.

Billing and Payment Tools Overview

Information about billing and payment tools that you can use to analyze your service usage and manage your costs.

My Services Use Cases

Use cases for the Oracle Cloud My Services API, to help you interact programmatically with My Services.

Security Credentials

This section describes the types of credentials you'll use when working with Oracle Cloud Infrastructure.

Console Password

- **What it's for:** Using the Console.
- **Format:** Typical password text string.
- **How to get one:** An administrator will provide you with a one-time password.
- **How to use it:** Sign in to the Console the first time with the one-time password, and then change it when prompted. Requirements for the password are displayed there. The one-time password expires in seven days. If you want to change the password later, see To change your Console password. Also, you or an administrator can reset the password in the Console or with the API (see To create or reset another user's Console password). Resetting the password creates a new one-time password that you'll be

prompted to change the next time you sign in to the Console. If you're blocked from signing in to the Console because you've tried 10 times in a row unsuccessfully, contact your administrator.

- **Note for Federated Users:** Federated users do not use a Console password. Instead, they sign in to the Console through their identity provider.

API Signing Key

- **What it's for:** Using the API (see Software Development Kits and Command Line Interface and Request Signatures).
- **Format:** RSA key pair in PEM format (minimum 2048 bits required).
- **How to get one:** See Required Keys and OCIDs.
- **How to use it:** In the Console, copy and paste the contents of the PEM public key file from the key pair (see How to Upload the Public Key). Then use the private key with the SDK or with your own client to sign your API requests. Note that after you've uploaded your first API key in the Console, you can use the API to upload any additional ones you want to use. If you provide the wrong kind of key (for example, your instance SSH key, or a key that isn't at least 2048 bits), you'll get an `InvalidKey` error.
- **Example:** The PEM public key looks something like this:

```
-----BEGIN PUBLIC KEY-----

MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAoTFqF...
...

-----END PUBLIC KEY--
```

Instance SSH Key

- **What it's for:** Accessing a compute instance.
- **Format:** For RSA, DSS, or DSA: minimum 2048 bits recommended. For ECDSA: minimum 128 bits recommended.
- **How to get one:** See Creating a Key Pair.

- **How to use it:** When you launch an instance, provide the public key from the key pair.
- **Example:** An RSA public key looks something like this:

```
ssh-rsa AAAAB3BzaC1yc2EAAAADAQABAAABAQD9BRwrUiLDki6P0+jZhwsjS2muM...

... john.smith@example.com
```

Auth Token

- **What it's for:** Authenticating with third-party APIs that do not support Oracle Cloud Infrastructure's signature-based authentication. For example, use an auth token as your password with Swift clients.
- **Format:** Typical password text string.
- **How to get one:** See Working with Auth Tokens.
- **How to use it:** Usage depends on the service your are authenticating with. Typically, you authenticate with third-party APIs by providing your Oracle Cloud Infrastructure Console login, your auth token provided by Oracle, and your organization's Oracle tenant name.

Regions and Availability Domains

Oracle Cloud Infrastructure is hosted in regions and availability domains. A region is a localized geographic area, and an availability domain is one or more data centers located within a region. A region is composed of one or more availability domains. Most Oracle Cloud Infrastructure resources are either region-specific, such as a virtual cloud network, or availability domain-specific, such as a compute instance. Traffic between availability domains and between regions is encrypted.

Availability domains are isolated from each other, fault tolerant, and very unlikely to fail simultaneously. Because availability domains do not share infrastructure such as power or cooling, or the internal availability domain network, a failure at one availability domain within a region is unlikely to impact the availability of the others within the same region.

The availability domains within the same region are connected to each other by a low latency, high bandwidth network, which makes it possible for you to provide high-availability

connectivity to the internet and on-premises, and to build replicated systems in multiple availability domains for both high-availability and disaster recovery.

Oracle is adding multiple cloud regions around the world to provide local access to cloud resources for our customers. To accomplish this quickly, we've chosen to launch regions in new geographies with one availability domain.

As regions require expansion, we have the option to add capacity to existing availability domains, to add additional availability domains to an existing region, or to build a new region. The expansion approach in a particular scenario is based on customer requirements as well as considerations of regional demand patterns and resource availability.

For any region with one availability domain, a second availability domain or region in the same country or geo-political area will be made available within a year to enable further options for disaster recovery that support customer requirements for data residency where they exist.

Regions are completely independent of other regions and can be separated by vast distances—across countries or even continents. Generally, you would deploy an application in the region where it is most heavily used, because using nearby resources is faster than using distant resources. However, you can also deploy applications in different regions for these reasons:

- To mitigate the risk of region-wide events such as large weather systems or earthquakes.
- To meet varying requirements for legal jurisdictions, tax domains, and other business or social criteria.

Region Name	Region Location	Region Key	Availability Domains
ap-seoul-1	Seoul, South Korea	ICN	1
ap-tokyo-1	Tokyo, Japan	NRT	1
ca-toronto-1	Toronto, Canada	YYZ	1

Region Name	Region Location	Region Key	Availability Domains
eu-frankfurt-1	Frankfurt, Germany	FRA	3
uk-london-1	London, United Kingdom	LHR	3
us-ashburn-1	Ashburn, VA	IAD	3
us-phoenix-1	Phoenix, AZ	PHX	3

To subscribe to a region, see Managing Regions.

Note

Your Tenancy's Availability Domain Names

Oracle Cloud Infrastructure randomizes the availability domains by tenancy to help balance capacity in the data centers. For example, the availability domain labeled PHX-AD-1 for tenancyA may be a different data center than the one labeled PHX-AD-1 for tenancyB. To keep track of which availability domain corresponds to which data center for each tenancy, Oracle Cloud Infrastructure uses tenancy-specific prefixes for the availability domain names. For example: the availability domains for your tenancy are something like *Uocm:*PHX-AD-1, *Uocm:*PHX-AD-2, and so on.

To get the specific names of your tenancy's availability domains, use the ListAvailabilityDomains operation, which is available in the IAM API. You can also see the names when you use the Console to launch an instance and choose which availability domain to launch the instance into.

Fault Domains

A fault domain is a grouping of hardware and infrastructure within an availability domain. Each availability domain contains three fault domains. Fault domains let you distribute your instances so that they are not on the same physical hardware within a single availability domain. A hardware failure or Compute hardware maintenance that affects one fault domain does not affect instances in other fault domains.

To control the placement of your compute, bare metal DB system, or virtual machine DB system instances, you can optionally specify the fault domain for a new instance at launch time. If you do not specify the fault domain, the system selects one for you. To change the fault domain for an instance, terminate it and launch a new instance in the preferred fault domain.

Use fault domains to:

- Protect against unexpected hardware failures
- Protect against planned outages due to Compute hardware maintenance
- See Fault Domains in Best Practices for Your Compute Instance for recommendations on using fault domains when provisioning application and database servers.
- See Fault Domain Considerations for 2-node Virtual Machine DB Systems and Availability Domain and Fault Domain Considerations for Data Guard for more information on using fault domains when provisioning Oracle bare metal and virtual machine DB systems.

Service Availability Across Regions

All Oracle Cloud Infrastructure regions offer core infrastructure services, including the following:

- Compute: Compute (Intel based Bare Metal & VM, DenseIO & Standard), Container Engine for Kubernetes, Registry
- Storage: Block Volume, File Storage, Object Storage, Archive Storage

- Networking: Virtual Cloud Network, Load Balancing, FastConnect (specific partners as available and requested)
- Database: Database, Exadata Cloud Service, Autonomous Data Warehouse, Autonomous Transaction Processing
- Edge: DNS
- Platform: Identity and Access Management, Tagging, Audit

Generally available cloud services beyond those in the preceding list are made available based on regional customer demand. Any service can be made available within a maximum of three months, with many services deploying more quickly. New cloud services are made available in regions as quickly as possible based on a variety of considerations including regional customer demand, ability to achieve regulatory compliance where applicable, resource availability, and other factors. Because of our low latency interconnect backbone, customers can use cloud services in other geographic regions with effective results when they are not available in their home region, provided that data residency requirements do not prevent them from doing so. We regularly work with customers to help ensure effective access to required services.

Resource Availability

The following sections list the resource types based on their availability: global across regions, within a single region, or within a single availability domain.

Tip

In general: IAM resources are global. DB Systems, instances, and volumes are specific to an availability domain. Everything else is regional. Exception: Subnets were originally designed to be specific to an availability domain. Now, you can create regional subnets, which is what Oracle recommends.

Global Resources

- API signing keys
- compartments
- dynamic groups
- federation resources
- groups
- policies
- tag namespaces
- tag keys
- users

Regional Resources

- alarms
- buckets: Although buckets are regional resources, they can be accessed from any location if you use the correct region-specific Object Storage URL for the API calls.
- clusters
- customer-premises equipment (CPE)
- DHCP options sets
- dynamic routing gateways (DRGs)
- encryption keys
- images
- internet gateways
- jobs
- key vaults
- load balancers
- local peering gateways (LPGs)

- metrics
- NAT gateways
- node pools
- ons-subscriptions
- ons-topics
- repositories
- reserved public IPs
- route tables
- security lists
- service gateways
- stacks
- subnets: When you create a subnet, you choose whether it's regional or specific to an availability domain. Oracle recommends using regional subnets.
- virtual cloud networks (VCNs)
- volume backups: They can be restored as new volumes to any availability domain within the same region in which they are stored.

Availability Domain-Specific Resources

- DB Systems
- ephemeral public IPs
- instances: They can be attached only to volumes in the same availability domain.
- subnets: When you create a subnet, you choose whether it is regional or specific to an availability domain. Oracle recommends using regional subnets.
- volumes: They can be attached only to an instance in the same availability domain.

IP Address Ranges

This section lists public IP address ranges for services that are deployed in Oracle Cloud Infrastructure. You should whitelist these CIDR blocks to ensure access to the services.

Public IP Address Ranges for VCNs

Each VCN's public IP addresses can come from the following CIDR blocks.

ap-seoul-1

- 132.145.80.0/21

ap-tokyo-1

- 132.145.112.0/21

ca-toronto-1

- 132.145.96.0/21
- 132.145.104.0/22

eu-frankfurt-1

- 130.61.8.0/21
- 130.61.16.0/20
- 130.61.32.0/19
- 130.61.64.0/19
- 130.61.96.0/23
- 130.61.104.0/21

- 130.61.112.0/20
- 132.145.232.0/21
- 132.145.240.0/21
- 132.145.248.0/21

uk-london-1

- 132.145.8.0/21
- 132.145.16.0/20
- 132.145.32.0/19
- 132.145.64.0/23

us-ashburn-1

- 129.213.8.0/21
- 129.213.16.0/20
- 129.213.32.0/19
- 129.213.64.0/18
- 129.213.128.0/18
- 129.213.192.0/21
- 129.213.208.0/21
- 132.145.128.0/18
- 132.145.192.0/19

us-phoenix-1

- 129.146.0.0/21
- 129.146.8.0/22

- 129.146.16.0/20
- 129.146.32.0/19
- 129.146.64.0/18
- 129.146.128.0/19
- 129.146.160.0/20
- 129.146.208.0/21

Public IP Address Ranges for the Oracle Services Network

The *Oracle Services Network* is a conceptual network in Oracle Cloud Infrastructure that is reserved for Oracle services. Following are the CIDR blocks of the Oracle Services Network in each region. This list is not expected to change frequently because the blocks were sized to accommodate additional future services.

ap-seoul-1

- 134.70.96.0/22
- 140.91.40.0/23
- 140.204.24.128/25
- 192.29.16.0/21

ap-tokyo-1

- 134.70.80.0/22
- 140.91.32.0/23
- 140.204.8.128/25
- 192.29.32.0/21

ca-toronto-1

- 134.70.72.0/22
- 140.91.28.0/23
- 140.204.0.128/25
- 192.29.0.0/21
- 192.29.8.0/22

eu-frankfurt-1

- 130.61.0.0/21
- 134.70.40.0/21
- 134.70.48.0/22
- 138.1.0.0/20
- 138.1.40.0/21
- 138.1.64.0/20
- 138.1.96.0/21
- 138.1.104.0/22
- 138.1.160.0/19
- 138.1.192.0/20
- 140.91.16.0/22
- 140.91.20.0/23
- 140.91.198.0/23
- 147.154.128.0/18
- 147.154.192.0/20
- 147.154.208.0/21

uk-london-1

- 130.35.112.0/22
- 132.145.0.0/21
- 134.70.56.0/21
- 134.70.64.0/22
- 138.1.16.0/20
- 138.1.80.0/20
- 138.1.208.0/20
- 138.1.224.0/19
- 140.91.22.0/23
- 140.91.24.0/22
- 140.91.200.0/23
- 147.154.224.0/19

us-ashburn-1

- 129.213.0.0/21
- 130.35.16.0/20
- 130.35.48.0/20
- 130.35.64.0/19
- 130.35.96.0/20
- 130.35.120.0/21
- 130.35.144.0/20
- 130.35.176.0/20
- 130.35.192.0/19
- 130.35.224.0/22

- 130.35.232.0/21
- 134.70.24.0/21

- 140.91.12.0/22
- 140.91.196.0/23
- 147.154.0.0/18
- 147.154.64.0/20
- 147.154.80.0/21

us-phoenix-1

- 129.146.12.0/22
- 130.35.0.0/20
- 130.35.128.0/20
- 130.35.240.0/20
- 134.70.8.0/21
- 134.70.16.0/22
- 138.1.32.0/21
- 138.1.128.0/19
- 140.91.4.0/22
- 140.91.8.0/23
- 140.91.194.0/23
- 147.154.96.0/19

Public IP Addresses for the Oracle YUM Repos

The Oracle YUM repos have regional public endpoints that follow this format:

yum-*<region>*.oracle.com

For example:

- yum-ashburn.oracle.com (for region us-ashburn-1)
- yum-frankfurt.oracle.com (for region eu-frankfurt-1)

You can use DNS lookup to determine the public IP address for each endpoint.

Resource Identifiers

This chapter describes the different ways your Oracle Cloud Infrastructure resources are identified.

Oracle Cloud IDs (OCIDs)

Most types of Oracle Cloud Infrastructure resources have an Oracle-assigned unique ID called an *Oracle Cloud Identifier* (OCID). It's included as part of the resource's information in both the Console and API.

Important

To use the API, you need the OCID for your tenancy. For information about where to find it, see the next section.

OCIDs use this syntax:

```
ocid1.<RESOURCE TYPE>.<REALM>.[REGION][.FUTURE USE].<UNIQUE ID>
```

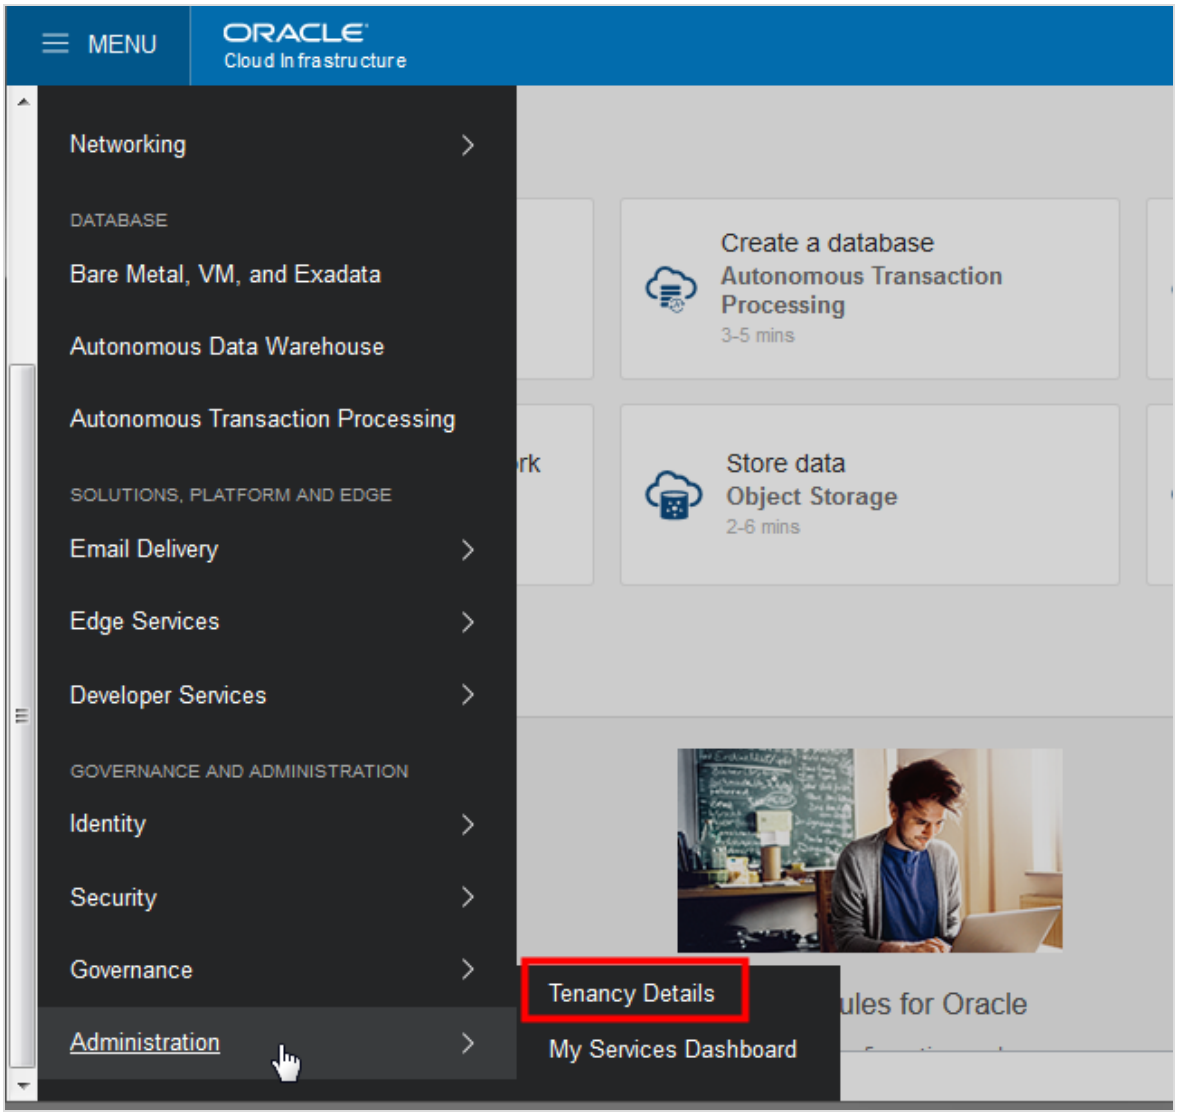
- **ocid1:** The literal string indicating the version of the OCID.
- **resource type:** The type of resource (for example, `instance`, `volume`, `vcn`, `subnet`, `user`, `group`, and so on).
- **realm:** The realm the resource is in. A *realm* is a set of regions that share entities. The only possible value is `oc1`.
- **region**: The region the resource is in (for example, `phx`, `iad`, `eu-frankfurt-1`). With the introduction of the Frankfurt region, the format switched from a three-character code to a longer string. This part is present in the OCID only for regional resources or those specific to a single availability domain. If the region is not applicable to the resource, this part might be blank (see the example tenancy ID below).
- **future use:** Reserved for future use. Currently blank.
- **unique ID:** The unique portion of the ID. The format may vary depending on the type of resource or service.

Example OCIDs

Tenancy:

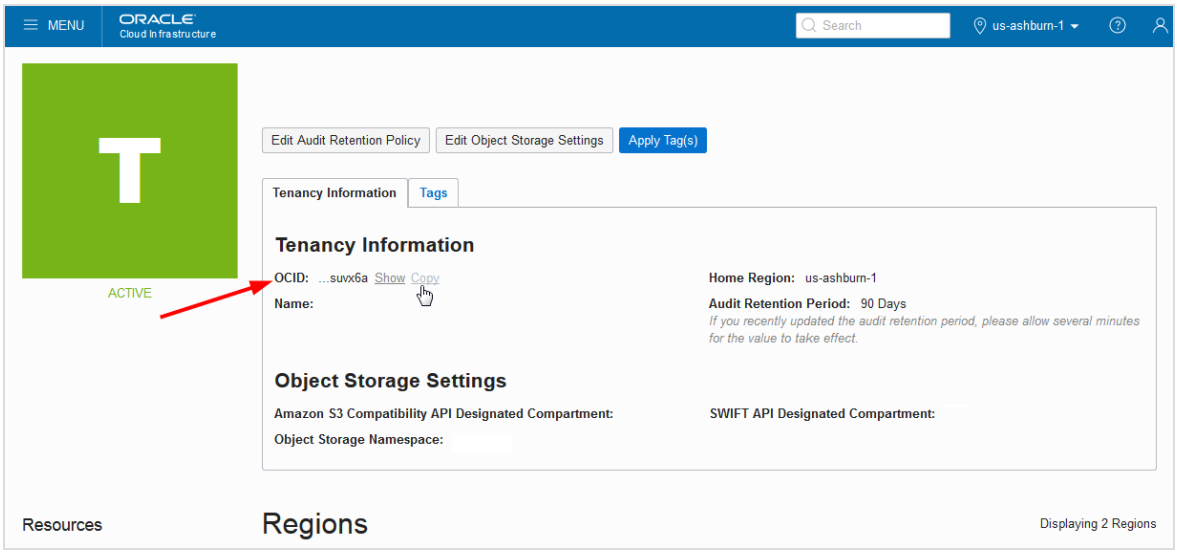
```
ocid1.tenancy.oc1..aaaaaaaaba3pv6wkcr4jqae5f44n2b2m2yt2j6rx32uzr4h25vqstifsfdsq
```

Instance:



```
ocid1.instance.oc1.phx.abuw4ljrlsfiqw6vzzxb43vyypt4pkodawglp3wqxjqofakrwvou52gb6s5a
```

Where to Find Your Tenancy's OCID



If you use the Oracle Cloud Infrastructure API, you need your tenancy's OCID in order to sign the API requests. You also use the tenancy ID in some of the IAM API operations.

Get the tenancy OCID from the Oracle Cloud Infrastructure Console on the **Tenancy Details** page:

1. Open the navigation menu, under Governance and Administration, go to **Administration** and click **Tenancy Details**.

2. The tenancy OCID is shown under **Tenancy Information**. Click **Copy** to copy it to your clipboard.

The tenancy OCID looks something like this (notice the word "tenancy" in it):

```
ocid1.tenancy.oc1..<unique_ID>
```

Name and Description (IAM Only)

The IAM service requires you to assign a unique, unchangeable *name* to each of your IAM resources (users, groups, policies, and compartments). The name must be unique within the scope of the type of resource (for example, you can only have one user with the name BobSmith). Notice that this requirement is specific to IAM and not the other services.

The name you assign to a user at creation is their login for the Console.

You can use these names instead of the OCID when writing a policy (for example, `Allow group <GROUP NAME> to manage all-resources in compartment <COMPARTMENT NAME>`).

In addition to the name, you must also assign a *description* to each of your IAM resources (although it can be an empty string). It can be a friendly description or other information that helps you easily identify the resource. The description does not have to be unique, and you can change it whenever you like. For example, you might want to use the description to store

the user's email address if you're not already using the email address as the user's unique name.

Display Name

For most of the Oracle Cloud Infrastructure resources you create (other than those in IAM), you can optionally assign a *display name*. It can be a friendly description or other information that helps you easily identify the resource. The display name does not have to be unique, and you can change it whenever you like. The Console shows the resource's display name along with its OCID.

Resource Tags

When you have many resources (for example, instances, VCNs, load balancers, and block volumes) across multiple compartments in your tenancy, it can become difficult to track resources used for specific purposes, or to aggregate them, report on them, or take bulk actions on them. *Tagging* allows you to define keys and values and associate them with resources. You can then use the tags to help you organize and list resources based on your business needs.

There are two types of tags:

Defined tags are set up in your tenancy by an administrator. Only users granted permission to work with the defined tags can apply them to resources.

Free-form tags can be applied by any user with permissions on the resource.

For more detailed information about tags and their features, see Overview of Tags.

Tip

Watch a video to introduce you to the concepts and features of tagging: Introduction to Tagging.

Working with Resource Tags

Not all resources support tags. See Taggable Resources for the list of resources that support tags.

To add a defined tag to an existing resource

To apply a defined tag, you must have permission to use the namespace.

1. Open the Console, go to the details page of the resource you want to tag.
   For example, to tag a compute instance: Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. A list of the instances in your current compartment is displayed. Find the instance that you want to tag, and click its name to view its details page.
2. Click **Apply Tags**.
3. In the **Apply Tags to the Resource** dialog:
   a. Select the **Tag Namespace**.
   b. Select the **Tag Key**.
   c. Enter a **Value**.
   d. To apply another tag, click **+ Additional Tag**.
   e. When finished adding tags, click **Apply Tag(s)**.

To add a free-form tag to an existing resource

1. Open the Console, go to the details page of the resource you want to tag.
   For example, to tag a compute instance: Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. A list of the instances in your current compartment is displayed. Find the instance that you want to tag, and click its name to view its details page.
2. Click **Apply Tags**.

3. In the **Apply Tags to the Resource** dialog:
    a. Select **None (apply a free-form tag)**.
    b. Enter the **Tag Key**.
    c. Enter a **Value**.
    d. To apply another tag, click **+ Additional Tag**.
    e. When finished adding tags, click **Apply Tag(s)**.

To add a tag during resource creation

You can apply tags during resource creation. The location of the **Apply Tag(s)** option in the dialog varies by resource. The general steps are:

1. In the resource Create dialog, click **Apply Tags**.
2. In the **Apply Tags to the Resource** dialog:
    a. Select the **Tag Namespace**, or select **None** to apply a free-form tag.
    b. Select or enter the **Tag Key**.
    c. Enter a **Value**.
    d. To apply another tag, click **+ Additional Tag**.
    e. Click **Apply Tag(s)**.

To filter a list of resources by a tag

Open the Console, click the service name and then click the resource you want to view. The left side of the page shows all the filters currently applied to the list.

For example, to view compute instances: Click **Compute** and then click **Instances**, to see the list of instances in your current compartment.

To filter a list of resources by a defined tag

1. Next to **Tag Filters**, click **add**.
2. In the **Apply a Tag Filter** dialog, enter the following:
    a. **With Tag Type:** Select **Defined Tag**.
    b. **In Namespace:** Select the tag namespace.
    c. **With Key:** Select a specific key.
    d. **With Value:** Select from the following:
        - Any - returns all resources tagged with the selected namespace and key, regardless of the tag value.
        - Equal to - returns resources with the tag value you enter in the text box. Enter a single value in the text box. To specify multiple values for the same namespace and key, click **OR** to display another text box. Enter one value per text box.

To filter a list of resources by a free-form tag

1. Next to **Tag Filters**, click **add**.
2. In the **Apply a Tag Filter** dialog, enter the following:
    a. **With Tag Type:** Select **Freeform Tag**.
    b. **With Key:** Enter the tag key.
    c. **With Value:** Select from the following:
        - Any - returns all resources tagged with the selected free-form tag key, regardless of the tag value.
        - Equal to - returns resources with the tag value you enter in the text box. Enter a single value in the text box. To specify multiple values for the same key, click **OR** to display another text box. Enter one value per text box.

To update a tag applied to a resource

1. Open the Console, click the service name and then click the resource you want to view. For example, to view compute instances: Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. A list of the instances in your current compartment is displayed. Find the instance that you want to update, and click its name to view its details page.
2. Click **Tags**.
   The list of tags applied to the resource is displayed.
3. Find the tag you want to update and click the pencil icon next to it.
4. Enter the new value.
5. Click **Save**.

To remove a tag from a resource

1. Open the Console, click the service name and then click the resource you want to view. For example, to view a compute instance: Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. A list of the instances in your current compartment is displayed. Find the instance that you want to remove the tag from, and click its name to view its details page.
2. Click **Tags**.
   The list of tags applied to the resource is displayed.
3. Find the tag you want to remove and click the pencil icon next to it.
4. Click **Remove Tag**.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

To apply a tag to a resource using the API, use the appropriate resource's `create` or `update` operation.

Resource Monitoring

You can monitor the health, capacity, and performance of your Oracle Cloud Infrastructure resources when needed using queries or on a passive basis using alarms. Queries and alarms rely on metrics emitted by your resource to the Monitoring service.

Prerequisites

- IAM policies: To monitor resources, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. The policy must give you access to the monitoring services as well as the resources being monitored. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in. For more information on user authorizations for monitoring, see the Authentication and Authorization section for the related service: Monitoring or Notifications.
- Metrics exist in Monitoring: The resources that you want to monitor must emit metrics to the Monitoring service.
- Compute instances: To emit metrics, Compute instances must be monitoring-enabled. OracleCloudAgent software installation may also be required. For more information, see Enabling Monitoring for Compute Instances.

Working with Resource Monitoring

Not all resources support monitoring. See Supported Services for the list of resources that support the Monitoring service, which is required for queries and alarms used in monitoring.

The Monitoring service works with the Notifications service to notify you when metrics breach. For more information about these services, see Monitoring Overview and Notifications Overview.

To view default metric charts for a resource

On the page for the resource of interest, under **Resources**, click **Metrics**.

For example, to view metric data for a Compute instance:

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. Click the instance you're interested in.
3. On the instance detail page, under **Resources**, click **Metrics**.
   A chart is shown for each metric. For a list of metrics related to Compute instances, see Compute Metrics.

The Console displays the last hour of metric data for the selected resource. A chart is shown for each metric emitted by the selected resource.

For a list of metrics emitted by your resource, see Supported Services.

To view default metric charts for a set of resources

Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Monitoring** and click **Service Metrics**.

The **Service Metrics** page displays the default charts for all resources in the first accessible **Compartment** and **Metric Namespace**. Very small or large values are indicated by International System of Units (SI units), such as M for mega (10 to the sixth power).

Don't see all expected resources or metrics?

- Try a different time range.

- Confirm that the missing resources are emitting metrics. See Enabling Monitoring for Compute Instances.
- Review limits information. Limits information for returned data includes the 100,000 data point maximum and time range maximums (determined by resolution, which relates to interval). See MetricData Reference.

To create a query

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Monitoring** and click **Metrics Explorer**.
   The **Metrics Explorer** page displays an empty chart with fields to build a query.
2. Fill in the fields for a new query.
   - **Compartment**: The compartment containing the resources that you want to monitor. By default, the first accessible compartment is selected.
   - **Metric Namespace**: The service or application emitting metrics for the resources that you want to monitor.
   - **Metric Name**: The name of the metric. Only one metric can be specified. Metric selections depend on the selected compartment and metric namespace.
     Example: **CpuUtilization**
   - **Interval**: The aggregation window.

     ### Interval values

     - **1m** - 1 minute
     - **5m** - 5 minutes
     - **1h** - 1 hour

Note

For metric queries, the interval you select drives the default resolution of the request, which determines the maximum time range of data returned.

Maximum time range returned for a query

The maximum time range returned for a metric query depends on the resolution. By default, for metric queries, the resolution is the same as the query interval. Following are the maximum time ranges returned for each interval selection available in the Console.

Interval	Default resolution (metric queries)	Maximum time range returned
1h	1 hour	90 days
5m	5 minutes	30 days
1m	1 minute	7 days

For more information about the resolution parameter as used in metric queries, see SummarizeMetricsData.

- **Statistic**: The aggregation function.

  Statistic values

  - **COUNT**- The number of observations received in the specified time period.
  - **MAX** - The highest value observed during the specified time period.
  - **MEAN** - The value of Sum divided by Count during the specified time period.
  - **MIN** - The lowest value observed during the specified time period.
  - **P50** - The value of the 50th percentile.
  - **P90** - The value of the 90th percentile.
  - **P95** - The value of the 95th percentile.
  - **P99** - The value of the 99th percentile.
  - **P99.5** - The value of the 99.5th percentile.
  - **RATE** - The per-interval average rate of change.
  - **SUM** - All values added together.

- **Metric dimensions**: Optional filters to narrow the metric data evaluated.

  Dimension fields

  - **Dimension Name**: A qualifier specified in the metric definition. For example, the dimension `resourceId` is specified in the metric definition for `CpuUtilization`.

    Note

    Long lists of dimensions are trimmed.

    - To view dimensions by name, type one or more characters in the box. A refreshed (trimmed) list shows matching dimension names.
    - To retrieve all dimensions for a given metric, use the following API operation: ListMetrics

  - **Dimension Value**: The value you want to use for the specified dimension. For example, the resource identifier for your instance of interest.
  - **+ Additional dimension**: Adds another name-value pair for a dimension.

- **Aggregate Metric Streams**: Aggregates all results to plot a single aggregated average for all metric streams. This average is plotted as a single line on the metric chart. This operation is helpful when you want to plot a metric as one line for all resources.

3. Click **Update Chart**.
   The chart shows the results of your new query. Very small or large values are indicated by International System of Units (SI units), such as M for mega (10 to the sixth power). Units correspond to the selected metric and do not change by statistic.

   ### Troubleshooting Errors and Query Limits

   If you see an error that the query has exceeded the maximum number of metric streams, then update the query to evaluate a number of metric streams that is within the limit. For example, you can reduce the metric streams by specifying dimensions. You can continue to evaluate all metric streams that were in the original query by spreading the metric streams across multiple queries (or alarms).
   Limits information for returned data includes the 100,000 data point maximum and time range maximums (determined by resolution, which relates to interval). See MetricData Reference.

4. To customize the y-axis label or range, type the label you want into **Y-Axis Label** or type the minimum and maximum values you want into **Y-Axis Min Value** and **Y-Axis Max Value**.
   Only numeric characters are allowed for custom ranges. Custom labels and ranges are not persisted in shared queries (MQL).
5. To view the query as a Monitoring Query Language (MQL) expression, click **Advanced Mode**.
   Advanced Mode is located on the right, under the chart.
   Use Advanced Mode to edit your query using MQL syntax to aggregate results by group. The MQL syntax also supports additional parameter values. For more information about query parameters in Basic Mode and Advanced Mode, see Monitoring Query Language (MQL) Reference.
6. To create another query, click **Add Query** below the chart.

To create an alarm

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Monitoring** and click **Alarm Definitions**.
2. Click **Create alarm**.

Note

You can also create an alarm from a predefined query on the **Service Metrics** page. Expand **Options** and click **Create an Alarm on this Query**. For more information about service metrics, see Viewing Default Metric Charts.

3. On the **Create Alarm** page, under **Define alarm**, fill in or update the alarm settings:

Note

To toggle between Basic Mode and Advanced Mode, click **Switch to Advanced Mode** or **Switch to Basic Mode** (to the right of **Define Alarm**).

Basic Mode (default)

By default, this page uses **Basic Mode**, which separates the metric from its dimensions and its trigger rule.

- **Alarm Name**: User-friendly name for the new alarm.
- **Alarm Severity**: The perceived type of response required when the alarm is in the firing state.

- **Alarm Body**: The human-readable content of the notification delivered. Oracle recommends providing guidance to operators for resolving the alarm condition. Consider adding links to standard runbook practices. Example: "High CPU usage alert. Follow runbook instructions for resolution."
- **Tags (optional):** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
- **Metric description**: The metric to evaluate for the alarm condition.
    - **Compartment**: The compartment containing the resources that emit the metrics evaluated by the alarm. The selected compartment is also the storage location of the alarm. By default, the first accessible compartment is selected.
    - **Metric Namespace**: The service or application emitting metrics for the resources that you want to monitor.
    - **Metric Name**: The name of the metric. Only one metric can be specified. Example: **CpuUtilization**

- **Interval**: The aggregation window, or the frequency at which data points are aggregated.

  ### Interval values

  - **1m** - 1 minute
  - **5m** - 5 minutes
  - **1h** - 1 hour

  Note

  For alarm queries, the specified interval has no effect on the resolution of the request. The only valid value of the resolution for an alarm query request is `1m`. For more information about the resolution parameter as used in alarm queries, see Alarm.

- **Statistic**: The aggregation function.

  ### Statistic values

  - **COUNT**- The number of observations received in the specified time period.
  - **MAX** - The highest value observed during the specified time period.
  - **MEAN** - The value of Sum divided by Count during the specified time period.
  - **MIN** - The lowest value observed during the specified time period.

- **P50** - The value of the 50th percentile.
- **P90** - The value of the 90th percentile.
- **P95** - The value of the 95th percentile.
- **P99** - The value of the 99th percentile.
- **P99.5** - The value of the 99.5th percentile.
- **RATE** - The per-interval average rate of change.
- **SUM** - All values added together.

- **Metric dimensions**: Optional filters to narrow the metric data evaluated.

  Dimension fields

  - **Dimension Name**: A qualifier specified in the metric definition. For example, the dimension `resourceId` is specified in the metric definition for `CpuUtilization`.

    Note

    Long lists of dimensions are trimmed.

    - To view dimensions by name, type one or more characters in the box. A refreshed (trimmed) list shows matching dimension names.
    - To retrieve all dimensions for a given metric, use the following API operation: ListMetrics

  - **Dimension Value**: The value you want to use for the specified dimension. For example, the resource identifier for your instance of interest.
  - **+ Additional dimension**: Adds another name-value pair for a dimension.

- **Trigger rule**: The condition that must be satisfied for the alarm to be in the firing state. The condition can specify a threshold, such as 90% for CPU Utilization, or an absence.

- **Operator**: The operator used in the condition threshold.

  Operator values

  - **greater than**
  - **greater than or equal to**
  - **equal to**
  - **less than**
  - **less than or equal to**
  - **between** (inclusive of specified values)
  - **outside** (inclusive of specified values)
  - **absent**

- **Value**: The value to use for the condition threshold.
- **Trigger Delay Minutes**: The number of minutes that the condition must be maintained before the alarm is in firing state.

Advanced Mode

Click **Advanced Mode** or **Switch to Advanced Mode** to view the alarm query as a Monitoring Query Language (MQL) expression. Edit your query using MQL syntax to aggregate results by group or for additional parameter values. See Monitoring Query Language (MQL) Reference.

- **Alarm Name**: User-friendly name for the new alarm.
- **Alarm Severity**: The perceived type of response required when the alarm is in the firing state.
- **Alarm Body**: The human-readable content of the notification delivered. Oracle recommends providing guidance to operators for resolving the alarm condition.

Consider adding links to standard runbook practices. Example: "High CPU usage alert. Follow runbook instructions for resolution."

- **Tags (optional):** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
- **Metric description, dimensions, and trigger rule**: The metric to evaluate for the alarm condition, including dimensions and the trigger rule.
  - **Compartment**: The compartment containing the resources that emit the metrics evaluated by the alarm. The selected compartment is also the storage location of the alarm. By default, the first accessible compartment is selected.
  - **Metric Namespace**: The service or application emitting metrics for the resources that you want to monitor.
  - **Query Code Editor** box: The alarm query as a Monitoring Query Language (MQL) expression.
    Example alarm query:

    ```
    CpuUtilization[1m]{availabilityDomain=AD1}.groupBy(poolId).percentile(0.9) > 85
    ```

    For query syntax and examples, see Working with Metric Queries.
  - **Trigger Delay Minutes**: The number of minutes that the condition must be maintained before the alarm is in firing state.

The chart below the **Define alarm** section dynamically displays the last six hours of emitted metrics according to currently selected fields for the query. Very small or large values are indicated by International System of Units (SI units), such as M for mega (10 to the sixth power).

4. Set up notifications: Under **Notifications**, fill in the fields.

- **Destinations**:
  - **Destination Service**: The provider of the destination to use for notifications.

    Available options:
    - **Notifications Service**.
  - **Compartment**: The compartment storing the topic to be used for notifications. Can be a different compartment from the alarm and metric. By default, the first accessible compartment is selected.
  - **Topic**: The topic to use for notifications. Each topic supports a subscription protocol, such as PagerDuty.
  - **Create a topic**: Sets up a topic and subscription protocol in the selected compartment, using the specified destination service.
    - **Topic Name**: User-friendly name for the new topic. Example: "Operations Team " for a topic used to notify operations staff of firing alarms.
    - **Topic Description**: Description of the new topic.
    - **Subscription Protocol**: Medium of communication to use for the new topic. Configure your subscription for the protocol you want:

      Email subscription
      - **Subscription protocol**: Select **Email**.
      - **Email Addresses**: Type an email address.

      PagerDuty subscription
      - **Subscription Protocol**: Select **HTTPS (PagerDuty)**.

- **PagerDuty Integration URL**: Type (or copy and paste) the *integration key* portion of the URL for your PagerDuty subscription. (The other portions of the URL are hard-coded.)
  For information on setting up and retrieving your integration key, see the PagerDuty documentation.
  Example integration key: Your68a4Integration4dd8Key12f4f6
  Example integration URL: https://events.pagerduty.com/integration/Your68a4Integration4dd8Key12f4f6/enqueue

◦ **+ Additional destination service**: Adds another destination service and topic to use for notifications.

Note

Each alarm is limited to one destination per supported destination service.

- **Repeat Notification?**: While the alarm is in the firing state, resends notifications at the specified interval.
- **Notification Interval**: The period of time to wait before resending the notification.
- **Suppress Notifications**: Sets up a suppression time window during which to suspend evaluations and notifications. Useful for avoiding alarm notifications during system maintenance periods.
  - **Suppression Description**
  - **Start Time**
  - **End Time**

5. If you want to disable the new alarm, clear **Enable This Alarm?**.

6. Click **Save alarm**.
   The new alarm is listed on the **Alarm Definitions** page.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

To create a query, use the SummarizeMetricsData operation.

To create an alarm, use the CreateAlarm operation.

Service Limits

This topic describes the service limits for Oracle Cloud Infrastructure and the process for requesting a service limit increase.

About Service Limits and Usage

When you sign up for Oracle Cloud Infrastructure, a set of service limits are configured for your tenancy. The service limit is the quota or allowance set on a resource. For example, your tenancy is allowed a maximum number of compute instances per availability domain. These limits are generally established with your Oracle sales representative when you purchase Oracle Cloud Infrastructure. If you did not establish limits with your Oracle sales representative, or, if you signed up through the Oracle Store, default or trial limits are set for your tenancy. You can request to have a service limit raised.

You can view your tenancy's limits and usage by region in the Console. Be aware that:

- The Console may not yet display limits and usage information for all of the Oracle Cloud Infrastructure services or resources.
- The usage level listed for a given resource type could be greater than the limit if the limit was reduced after the resources were created.

- If all the resource limits are listed as 0, this means your account has been suspended. For help, contact Oracle Support.

If you don't yet have a tenancy or a user login for the Console, or if you don't find a particular limit listed in the Console, see Limits by Service for the default tenancy limits.

To view your tenancy's limits and usage (by region)

Note

Required Permission

If you're in the Administrators group, you have permission to view the limits and usage. If you're not, here's an example IAM policy that grants the required permission to users in a group called LimitsAndUsageViewers:

```
Allow group LimitsAndUsageViewers to inspect limits in tenancy
```

1. Open the Console. Open the **User** menu () and click **Tenancy:** *<your_tenancy_name>*.
2. Click **Service Limits** on the left side of the page.

Your resource limits and usage for the specific region are displayed, broken out by service. If a given resource type has limits per availability domain, the limit and usage for each availability domain is displayed.

When You Reach a Service Limit

When you reach the service limit for a resource, you receive an error when you try to create a new resource of that type. You are then prompted to submit a request to increase your limit. You cannot create a new resource until you are granted an increase to your service limit or you terminate an existing resource. Note that service limits apply to a specific scope, and

when the service limit in one scope is reached you may still have resources available to you in other scopes (for example, other availability domains).

Requesting a Service Limit Increase

You can submit a request to increase your service limits from within the Console. If you try to create a resource for which limit has been met, you'll be prompted to submit a limit increase request. Additionally, you can launch the request from the service limits page or at any time by clicking the link under the **Help** menu (?).

Note that the service limit increase is not immediate.

To request a service limit increase

1. Open the **Help** menu (?), go to **Support** and click **Request service limit increase**.
2. Enter the following:
    - **Primary Contact Details:** Enter the name and email address of the person making the request. Enter one email address only. A confirmation will be sent to this address.
    - **Service Category:** Select the appropriate category for your request.
    - **Resource:** Select the appropriate resource.
      Depending on your selection for resource, additional fields might display for more specific information.
    - **Reason for Request:** Enter a reason for your request. If your request is urgent or unusual, please provide details here.
3. Click **Submit Request**.

After you submit the request, the request is reviewed. If your request is awarded, a confirmation email is sent to the address provided in the primary contact details.

If we need additional information about your request, a follow-up email is sent to the address provided in the primary contact details.

Limits by Service

The following tables list the default limits for each service. Note the scope that each limit applies to (for example, per availability domain, per region, per tenant, etc.).

Note

Some services have additional limits. For more information, see the overview of each service.

Block Volume Limits

Limits apply to each availability domain. There are three availability domains per region.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Block Volumes aggregated size	100 TB	30 TB
Backups	1000	500

Compute Limits

Limits apply to each availability domain, unless otherwise noted. There are three availability domains per region.

Bare Metal Servers

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
BM.Standard2.52	1 (52 cores)	Contact Us
BM.DenseIO2.52	1 (52 cores)	Contact Us
BM.GPU2.2	1 (28 cores) (us-ashburn-1, eu-frankfurt-1)	Contact Us
BM.GPU3.8	Contact Us	Contact Us
BM.HPC2.36	Contact Us	Contact Us
BM.Standard.E2.64	1 (64 cores) (us-ashburn-1, uk-london-1)	Contact Us
Custom Images	100 per region	25 per region

Virtual Machines

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
VM.Standard2.1	40	1
VM.Standard2.2	30	1
VM.Standard2.4	30	Contact Us

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
VM.Standard.E2.1	5 (us-ashburn-1, uk-london-1)	1 (us-ashburn-1, uk-london-1)
VM.Standard.E2.2	5 (us-ashburn-1, uk-london-1)	1 (us-ashburn-1, uk-london-1)
VM.Standard.E2.4	5 (us-ashburn-1, uk-london-1)	Contact Us
VM.Standard.E2.8	5 (us-ashburn-1, uk-london-1)	Contact Us
VM.Standard2.8	10 (us-phoenix-1, us-ashburn-1) 5 (other regions)	Contact Us
VM.Standard2.16	10 (us-phoenix-1, us-ashburn-1) 5 (other regions)	Contact Us
VM.Standard2.24	10 (us-phoenix-1, us-ashburn-1) 5 (other regions)	Contact Us
VMDenseIO2.8	10	Contact Us
VMDenseIO2.16	10	Contact Us
VMDenseIO2.24	10	Contact Us
VM.GPU3.1	Contact Us	Contact Us
VM.GPU3.2	Contact Us	Contact Us
VM.GPU3.4	Contact Us	Contact Us

Container Engine for Kubernetes Limits

Container Engine for Kubernetes limits are **regional**.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Clusters	3 clusters per OCI region	1 cluster per OCI region
Nodes	1000 nodes per cluster	1000 nodes per cluster

Data Transfer Limits

Data Transfer limits are **regional**.

Data Transfer Disk

Resource	Monthly Universal Credits	Pay-As-You-Go
Transfer package	Contact Us	Contact Us

File a service request at My Oracle Support to increase the service limits for Data Transfer Disk. See Requesting a Service Limit Increase for details.

Data Transfer Appliance

Resource	Monthly Universal Credits	Pay-As-You-Go
Transfer appliances	Contact Your CSM	Contact Your CSM

Contact your Oracle Account Manager or Customer Success Manager (CSM) to place an order for transfer appliances. Your service limits are automatically set to the number of transfer appliances ordered. You do not need to file a service request to increase the service limits for Data Transfer Appliance.

Database Limits

Database limits are per availability domain.

Resources	Monthly Flex	Pay-as-You-Go or Promo
Autonomous Data Warehouse - Total OCPUs	128 cores	8 cores
Autonomous Transaction Processing - Total OCPUs	128 cores	8 cores
VM.Standard1 -Total OCPUs	10 cores	2 cores
VM.Standard2 -Total OCPUs	100 cores (us-phoenix-1, us-ashburn-1) 50 cores (eu-frankfurt-1, uk-london-1)	2 cores
Total VM DB Block Storage (see note)	10TB	2TB
BM.DenseIO1.36 (see availability note)	1 instance	1 instance
BM.DenseIO2.52	1 instance	1 instance
BM.HighIO1.36	1 instance	1 instance
Exadata.Quarter1.84 - X6	Contact Us	not available
Exadata.Half1.168 - X6	Contact Us	not available
Exadata.Full1.336 - X6	Contact Us	not available

Resources	Monthly Flex	Pay-as-You-Go or Promo
Exadata.Quarter2.92 - X7	Contact Us	not available
Exadata.Half2.184 - X7	Contact Us	not available
Exadata.Full2.368 - X7	Contact Us	not available
BM.RACLocalStorage1.72	Contact Us	Contact Us

Note

Total VM DB Block Storage - covers block storage for all VM.Standard1 and VM.Standard2 virtual machine databases.

BM.DenseIO1.36 - This DB system shape is available only to monthly universal credit customers with tenancies existing on or before November 9th, 2018, in the us-phoenix-1, us-ashburn-1, and eu-frankfurt-1 regions.

DNS Limits

DNS limits are **global**.

Resources	Monthly Universal Credits	Pay-as-You-Go or Promo
Zones	1,000 zones	1,000 zones
Records	25,000 per zone	25,000 per zone

Resources	Monthly Universal Credits	Pay-as-You-Go or Promo
Zone File Size	1 MB	1 MB

Email Delivery Limits

Limits apply to each tenant or availability domain, as specified. There are three availability domains per region.

Resource	Monthly Universal Credits	Pay-As-You-Go or Promo
Email volume	50,000 emails per day	200 emails per day
Maximum approved senders	10,000	2,000
SMTP credentials	2 per user	2 per user
Sending rate	18,000 emails per minute	10 emails per minute

Note

Message size is limited to 2 MB, inclusive of message headers, body, and attachments.

File Storage Limits

Limits apply to each tenant or availability domain, as specified. There are three availability domains per region.

Resource	Pre-Paid	Pay-As-You-Go
File systems	100 per tenant per availability domain	100 per tenant per availability domain
Mount targets	2 per tenant per availability domain	2 per tenant per availability domain
Maximum file system size	8 exabytes	8 exabytes

Health Checks Limits

Health Checks limits are **global**.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Endpoint tests	1000 per account	1000 per account

IAM Limits

IAM limits are **global**.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Users in a tenancy	250	250
Groups in a tenancy	250	250
Compartments in a tenancy	50	50
Policies in a tenancy	100	100
Statements in a policy	50	50
Users per group in a tenancy	100	100
Groups per user in a tenancy	50	50
Identity providers in a tenancy	3	3
Group mappings for an identity provider	50	50

Key Management Limits

Key Management limits are **global**.

Resources	Monthly Universal Credits	Pay-as-You-Go or Promo
Vaults in a tenancy	Contact Us	Contact Us
Keys in a vault (Key versions, whether enabled or disabled, count against your limits.)	Contact Us	Contact Us

The Key Management service is not available to promo customers.

Load Balancing Limits

Load Balancing limits are **regional**.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
LB-Capacity-100Mbps	3 Load Balancers	1 Load Balancer
LB-Capacity-400Mbps	3 Load Balancers	1 Load Balancer
LB-Capacity-8000Mbps	Contact Us	Contact Us

Monitoring Limits

Monitoring limits are **regional**.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Alarms	50	50
Metrics (posted by services)	Unlimited	Unlimited

Networking Limits

Networking service limits apply to different scopes, depending on the resource.

VCN and Subnet Limits

Resource	Scope	Monthly Universal Credits	Pay-as-You-Go or Promo
VCN	Region	10	10
Subnets	VCN	300	300

Gateway Limits

Resource	Scope	Monthly Universal Credits	Pay-as-You-Go or Promo
Dynamic routing gateways (DRGs)	Region	5	5
Internet gateways	VCN	1*	1*
Service gateways	VCN	1	1
NAT gateways	VCN	1	1
* Limit for this resource cannot be increased			

IP Address Limits

Resource	Scope	Monthly Universal Credits	Pay-as-You-Go or Promo
Reserved public IPs	Region	50	50
Ephemeral public IPs	Instance	2 per VM instance 16 per bare metal instance	2 per VM instance 16 per bare metal instance

DHCP Option Limits

Resource	Scope	Monthly Universal Credits	Pay-as-You-Go or Promo
DHCP options	VCN	300	300

Route Table Limits

Resource	Scope	Monthly Universal Credits	Pay-as-You-Go or Promo
Route tables	VCN	300	300
Route rules	Route table	100*	100*
* Limit for this resource cannot be increased			

Security List Limits

Resource	Scope	Monthly Universal Credits	Pay-as-You-Go or Promo
Security lists	VCN	300	300
Security lists	Subnet	5*	5*
Ingress and egress rules	Security list	200 ingress rules* and 200 egress rules*	200 ingress rules* and 200 egress rules*
* Limit for this resource cannot be increased			

IPSec VPN Connection Limits

Resource	Scope	Monthly Universal Credits	Pay-as-You-Go or Promo
IPSec VPN connections	Region	4	4
Customer-premises equipment objects (CPEs)	Region	10	10
Dynamic routing gateways (DRGs)	Region	See Gateway Limits	See Gateway Limits

FastConnect Limits

Resource	Scope	Monthly Universal Credits	Pay-as-You-Go or Promo
Cross-connects	Region	Contact Us	Contact Us
Virtual circuits	Region	10	10
Dynamic routing gateways (DRGs)	Region	See Gateway Limits	See Gateway Limits

Notifications Limits

Notifications limits are **regional**.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Topics	50 (Active or Creating*) per tenancy	Contact Us
Subscriptions	10 (Active or Pending*) per topic 100 (Pending*) per tenancy	Contact Us

*** A lifecycle state. See NotificationTopic Reference and Subscription Reference.**

Object Storage and Archive Storage Limits

Object Storage and Archive Storage limits are **regional**.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Buckets	1000 per compartment	1000 per compartment
Objects per bucket	Unlimited	Unlimited
Maximum object size	10 TiB	10 TiB
Maximum object part size	50 GiB	50 GiB

Registry Limits

Registry limits are **regional**.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Repositories	500 repositories per OCI region	500 repositories per OCI region
Images	500 images per repository	500 images per repository

Resource Manager Limits

Resource Manager limits are **regional**.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Stacks	100 stacks per tenant	10 stacks per tenant
Variables per stack	100	100

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Zip file per stack	11 MB	11 MB
Jobs (concurrent)	5 per tenant	1 per tenant
Job Duration	24 hours	24 hours

Traffic Management Steering Policies Limits

Traffic Management Steering Policies limits are **global**.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Policies	100 per tenant	100 per tenant
Attachments	1,000 per tenant	1,000 per tenant

WAF Limits

WAF limits are **global**.

Resource	Monthly Universal Credits	Pay-as-You-Go or Promo
Policies	50 per tenant	50 per tenant

Console Announcements

This topic describes the announcements that Oracle Cloud Infrastructure displays in the Console. Console announcements appear at the top of the page to communicate timely, important information about service status. You can also view a list of past announcements.

Types of Announcements

There are different categories of announcements. An announcement's prefix helps you understand, at a glance, the type and relative severity of the information and whether there's anything you can or must do. Announcement types currently include the following, in order of most important to least:

- **Required action.** You must take specific action within your environment.
- **Emergency change.** There is a time period during which an unplanned, but urgent, change associated with your environment will take place.
- **Recommended action.** You have specific action to take within your environment, but the action is not required.
- **Planned change.** There is a time period during which a planned change associated with your environment will take place.
- **Planned change extended.** The scheduled change period has extended beyond what was previously communicated.
- **Planned change rescheduled.** The planned change to your environment has been postponed to a later time or date.
- **Production event.** An impactful change to your environment either recently occurred or is actively occurring.
- **Planned change completed.** The planned change to your environment has been completed and regular operations have resumed.
- **Information.** There is information that you might find useful, but is not urgent and does not require action on your part.

For announcements that require action and affect Oracle Cloud Infrastructure Compute instances, you will get 30 days of advance notice. If you need to delay the actions described in the announcement, contact support to request one of the alternate dates listed in the announcement. Critical vulnerabilities might not be eligible for delay.

Authentication and Authorization

Depending on whether you have access, you might not see any announcements. With access to announcements, you can either see only the summary version of any given announcement or you can also view announcement details.

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Email Delivery

As part of your service agreement, Oracle Cloud Infrastructure also contacts you about service status announcements through email. These emails help alert you to upcoming changes that will impact your tenancy, such as those involving data centers or instances you use, or about required action on your part. Oracle sends these announcements to the tenant administrator email address and you cannot opt out of receiving this operational information. Whenever possible, we try to provide advance notice of impactful events. If you want to change the tenant administrator email address, contact Oracle Support. For more information, see Contacting Support.

Viewing Announcements

This section describes how to view announcements. The Console displays announcements as banners that span the width of the top of your browser window. As long as an announcement remains in effect and you have the access to view announcements, the banner announcement displays each time you sign in to the Console until you mark it as read. You can also view all past announcements. The Announcements icon displays a green dot if you have any unread announcements.

To dismiss a banner announcement

- To close a banner announcement until the next time you sign in to the Console, click the X at the far right edge of the banner. If you want to stop seeing an announcement as a banner altogether, you must mark it as read. For more information, see To mark an announcement as read.

To view the details of an announcement

1. Do one of the following:
    - If you are viewing a banner, click the **Show details** link near the far right edge of the banner.
    - If you are viewing a list of announcements, under the **Summary** column, click the announcement summary.
2. On the **Announcement Details** page, you can view the following information:
    - **Description.** This describes the issue or event in greater detail than the summary text of the announcement.
    - **OCID.** This is the announcement's unique, Oracle-assigned identifier.
    - **Reference Ticket Number.** You can use this number to refer to the issue when talking to Support.

- **Type.** This is one of several predefined categories that helps to set expectations about the nature and severity of the issue described.
- **Affected Service.** This indicates the Oracle Cloud Infrastructure services affected by the issue or event.
- **Region.** This tells you what Oracle Cloud Infrastructure regions are impacted.
- **Start Time.** This is when the issue or event was first detected.
- **End Time.** This is when the issue or event was resolved.
- **Required After.** This is the date after which you must address any required actions described in the announcement.
- **Created.** This is when the announcement was created.
- **Updated.** This is when the announcement was updated.
- **Additional Information.** This includes information such as workarounds or background material.
- **Impacted Resources.** This shows the resources that were affected in some way by the event that prompted the announcement.

3. Optionally, if you want to refer to the list of impacted resources later, click **Download Impacted Resources List**.

To view a list of all announcements

1. Click the Announcements icon (🔔).
2. The **Announcements** page displays all announcements. From this page, you can do the following:
   - **Filter.** You can filter announcements by type or by start or end date.
   - **Sort.** You can sort announcements by summary, type, event start time, or publish time (which indicates when the announcement was last updated).
   - **Mark as read.** You can mark announcements as read if you want stop seeing

them as banners in the Console in subsequent sessions.

- **View announcement details.** You can view the details of an announcement.

To filter a list of announcements

1. Click the Announcements icon (🔔).
2. To filter the list, under **Filters**, do one of the following:
   - Click **Type**, and then click a type from the list.
   - Click **Start Date**, and then choose a date to see only events that started on that date.
   - Click **End Date**, and then choose a date to see only events that ended on that date.
3. To clear a filter on a date, click the X next to the date.

To sort a list of announcements

1. Click the Announcements icon (🔔).
2. By default, the list displays announcements according to the event start time, from most recent to least. To sort the list another way, do one of the following:
   - Click **Summary**. The list sorts alphabetically, according to the summary of the announcement.
   - Click **Type**. The list sorts according to the importance of the announcement.
   - Click **Start Time**. The list sorts according to the start time of the event described in the announcement. If you begin by viewing the default sort order, the sort order will change to show the oldest announcement at the beginning of the list.
   - Click **Publish Time**. The list sorts according to the time that an announcement was last updated. You might find it helpful to sort by this column if you want to track an ongoing issue or if an announcement requires action on your part.
3. To sort the list again, repeat the previous step.

To mark an announcement as read

1. Click the Announcements icon (🔔).
2. Find the announcement that you want to mark as read, click the Actions icon (three dots), and then click **Mark As Read**.

Using the Command Line Interface (CLI)

For information about using the CLI, see Command Line Interface (CLI). For a complete list of flags and options available for CLI commands, see CLI Help.

To view the details of an announcement

Open a command prompt and run `oci announce announcements get` to view detailed information about an announcement:

```
oci announce announcements get --announcement-id <announcement_OCID>
```

For example:

```
oci announce announcements get --announcement-id
ocid1.announcement.region1..examplear73oue4jdywjjvietoc6im3cvb6xae4falm3faux5us3iwra3t6q
```

To view a list of all announcements

Open a command prompt and run `oci announce announcements list` to view a list of all announcements:

```
oci announce announcements list --compartment-id <compartment_OCID>
```

For example:

```
oci announce announcements list --compartment-id
ocid1.tenancy.oc1..exampleati4wjo6cvbxq4iusld5ltpneskcfy7lr4a6wfauxuwrwed5bsdea
```

To filter a list of announcements

Open a command prompt and run `oci announce announcements list` to filter a list of announcements.

To filter a list of announcements by announcement type:

```
oci announce announcements list --compartment-id <compartment_OCID> --announcement-type <announcement_type>
```

For example:

```
oci announce announcements list --compartment-id
ocid1.tenancy.oc1..exampleati4wjo6cvbxq4iusld5ltpneskcfy7lr4a6wfauxuwrwed5bsdea --announcement-type
ACTION_REQUIRED
```

To sort a list of announcements

Open a command prompt and run `oci announce announcements list` to sort a list of announcements.

To sort a list of announcements in ascending order of time created, from oldest to newest:

```
oci announce announcements list --compartment-id <compartment_OCID> --sort-order ASC
```

For example:

```
oci announce announcements list --compartment-id
ocid1.tenancy.oc1..exampleati4wjo6cvbxq4iusld5ltpneskcfy7lr4a6wfauxuwrwed5bsdea --sort-order ASC
```

To mark an announcement as read

Open a command prompt and run `oci announce user-status update` to mark an announcement as read:

```
oci announce user-status update --announcement-id <announcement_OCID> --user-status-announcement-id
<announcement_OCID> --user-id <user_OCID> --time-acknowledged <date_and_time>
```

For example:

```
oci announce user-status update --announcement-id
ocid1.announcement.region1..examplear73oue4jdywjjvietoc6im3cvb6xae4falm3faux5us3iwra3t6q --user-status-
announcement-id ocid1.announcement.region1..examplear73oue4jdywjjvietoc6im3cvb6xae4falm3faux5us3iwra3t6q
--user-id ocid1.user.region1..exampleaorxz3psplonigcvbzy5oaiwiubh7k7ip6zgklfauxic67kksu4oq --time-
acknowledged 2019-01-06T20:14:00+00:00
```

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Prerequisites for Oracle Platform Services on Oracle Cloud Infrastructure

This topic describes procedures that are required by some Oracle Platform Services before you can launch them on Oracle Cloud Infrastructure. The information in this topic applies only to the following services:

- Oracle Big Data Cloud
- Oracle Database Cloud Service
- Oracle Data Hub Cloud Service
- Oracle Event Hub Cloud Service
- Oracle Java Cloud Service
- Oracle MySQL Cloud Service
- Oracle SOA Cloud Service

For a list of all services supported on Oracle Cloud Infrastructure, see Information About Supported Platform Services.

Accessing Oracle Cloud Infrastructure

Oracle Cloud Infrastructure has a different interface and credential set than your Oracle Platform Services. You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see Software Development Kits and Command Line Interface.

To access the Console, you must use a supported browser (Oracle Cloud Infrastructure supports the latest desktop versions of Google Chrome, Microsoft Edge, Internet Explorer 11, Safari, Firefox, and Firefox ESR. Note that private browsing mode is not supported for Firefox, Internet Explorer, or Edge. Mobile browsers are not supported.

Required Identity and Access Management (IAM) Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

See Common Policies for more information and examples.

Resources Created in Your Tenancy by Oracle

Oracle creates a compartment in your tenancy for Oracle Platform Services. This compartment is specially configured by Oracle for the Oracle Cloud Infrastructure resources that you create through the Platform Services. You can't choose another compartment for Oracle to use.

Along with this compartment, Oracle creates the IAM policies to allow Oracle Platform Services access to the resources.

The compartment that Oracle creates for Oracle Platform Services is named: `ManagedCompartmentForPaaS`.

The polices that Oracle creates for Oracle Platform Services are:

- `PSM-root-policy`

  This policy is attached to the root compartment of your tenancy.
- `PSM-mgd-comp-policy`

  This policy is attached to the `ManagedCompartmentForPaaS` compartment.

Warning

Do not make any changes to these resources. Editing or renaming the policies or the compartment can result in loss of functionality.

Prerequisites for Oracle Platform Services

Before you can create instances of an Oracle Platform Service on Oracle Cloud Infrastructure, you need to have the following resources in your Oracle Cloud Infrastructure tenancy:

- A compartment for your resources
- A virtual cloud network (VCN) with at least one public subnet
- IAM policies to allow Oracle Platform Services to access the VCN
- An Object Storage bucket
- Credentials to use with Object Storage

Some of the Platform Services automatically create some of these resources for you. See details about your service in the following sections.

Setting Up the Prerequisites

Note

To use **Autonomous Data Warehouse Cloud**, you don't need to set up any of the resources listed in this prerequisites section. However, if you optionally choose to use Oracle Cloud Infrastructure Object Storage for data loading, you need to perform these two tasks:

Create a bucket

Create an auth token

Following are two scenarios with procedure sets. If you need to set up all the required resources, follow Scenario 1. If you already have a VCN in your Oracle Cloud Infrastructure tenancy that you want to use for Oracle Platform Services, follow Scenario 2.

To follow a tutorial on how to set up the prerequisites for Scenario 1, see Creating the Infrastructure Resources Required for Oracle Platform Services.

Scenario 1: I need to create all the prerequisite resources

Create a compartment

Important

You cannot use the `ManagedCompartmentForPaaS` for your VCN and bucket.

1. Open the navigation menu. Under **Governance and Administration**, go to **Identity** and click **Compartments**.
2. A list of the existing compartments in your tenancy is displayed.

3. Click **Create Compartment**.
4. Enter the following:
    - **Name:** For example, PaaSResources. Restrictions for compartment names are: Maximum 100 characters, including letters, numbers, periods, hyphens, and underscores. The name must be unique across all the compartments in your tenancy
    - **Description:** A friendly description.
5. Click **Create Compartment**.

Set up your virtual cloud network

This procedure creates a VCN with these characteristics:

- A VCN with CIDR 10.0.0.0/16.
- Three public subnets (10.0.0.0/24, 10.0.1.0/24, and 10.0.2.0/24) each using the VCN's default security list, default route table, and default DHCP options.
- An internet gateway, with the required route rule in the default route table.
- Use of the Internet and VCN Resolver for DNS, so your instances can use their hostnames instead of their private IP addresses to communicate with each other.

Tip

This Quick VCN procedure is useful for getting started and trying out Oracle Platform Services on Oracle Cloud Infrastructure. For production, use the procedure in VCNs and Subnets. That topic explains features such as how to specify the CIDR ranges for your VCN and subnets, and how to secure your network. When you use the advanced procedure, remember that the VCN that you create must have a public subnet for Oracle Platform Services to use.

1. Open the **Region** menu and select the region in which you want to create the Oracle PaaS service instance.
   Select a region that's within the default data region of your account. For example, if your default data region is EMEA, then select eu-frankfurt-1 or uk-london-1.
2. From the **Compartment** list, select the compartment you created.
3. Open the navigation menu. Under **Core Infrastructure**, go to **Networking** and click **Virtual Cloud Networks**.
4. Click **Create Virtual Cloud Network**.
5. In **Create in Compartment**, leave the default value (the compartment you're currently working in).
6. Enter a friendly name for the cloud network, for example: `PaaSVCN`. It doesn't have to be unique, and it cannot be changed later in the Console (but you can change it with the API).
7. Select **Create Virtual Cloud Network Plus Related Resources**.
8. Scroll down to the bottom of the dialog box and click **Create Virtual Cloud Network**.

Permit Oracle Platform Services to access resources

1. In the Console, navigate to the root compartment of your tenancy by clicking your tenancy name in the **Compartment** list.
2. Open the navigation menu. Under **Governance and Administration**, go to **Identity** and click **Policies**.
3. Click **Create Policy**.
4. Enter the following:
    - **Name:** A unique name for the policy. The name must be unique across all policies in your tenancy. You cannot change this later.
    - **Description:** A friendly description. You can change this later if you want to.
    - **Policy Versioning:** Select **Keep Policy Current** if you'd like the policy to stay current with any future changes to the service's definitions of verbs and resources. Or if you'd prefer to limit access according to the definitions that were current on a specific date, select **Use Version Date** and enter that date in format YYYY-MM-DD format. For more information, see Policy Language Version.
    - **Statement:** To allow Oracle Platform Services access to use the network in your compartment, enter the following policy statements. Replace *<compartment_name>* with your compartment name. Click **+** after each statement to add another.

      ```
      Allow service PSM  to inspect vcns in compartment <compartment_name>
      ```

      ```
      Allow service PSM  to use subnets in compartment <compartment_name>
      ```

      ```
      Allow service PSM  to use vnics in compartment <compartment_name>
      ```

      ```
      Allow service PSM  to manage security-lists in compartment <compartment_name>
      ```

      For more information about policies, see Policy Basics and also Policy Syntax.
5. (Optional) If you want to enable the use of an Autonomous Transaction Processing or Oracle Cloud Infrastructure Database instance in your compartment as the infrastructure schema database for your Oracle Java Cloud Service instance, then add the following statements:

```
Allow service PSM to inspect autonomous-database in compartment <compartment_name>

Allow service PSM to inspect database-family in compartment <compartment_name>
```

6. Click **Create**.

Create a bucket

1. Open the **Region** menu and select the region in which you want to create the Oracle PaaS service instance.
   Select a region that's within the default data region of your account. For example, if your default data region is EMEA, then select eu-frankfurt-1 or uk-london-1.
2. Open the navigation menu. Under **Core Infrastructure**, click **Object Storage**.
3. Choose the compartment you created.
4. Click **Create Bucket**.
5. In the **Create Bucket** dialog, enter a bucket name, for example: `PaasBucket`.
   Make a note of the name you enter. You will need it when you create an instance for your Oracle Platform Service later.
6. Click **Create Bucket**.

Set up credentials to use with Object Storage

For Big Data Cloud, set up an API signing key:

Set up an API signing key

Follow the instructions in this topic: Required Keys and OCIDs.

For all other services, create an auth token. Note that your service might refer to this credential as a Swift password. Use the auth token wherever you are asked to provide a Swift password.

Create an auth token

1. View the user's details:
   - If you're creating an auth token for yourself: Open the **User** menu () and click **User Settings**.
   - If you're an administrator creating an auth token for another user: In the Console, click **Identity**, and then click **Users**. Locate the user in the list, and then click the user's name to view the details.
2. On the left side of the page, click **Auth tokens**.
3. Click **Generate Token**.
4. Enter a friendly description for the token and click **Generate Token**.
   The new token is displayed.
5. Copy the token immediately, because you can't retrieve it again after closing the dialog box. Also, make sure you have this token available when you create your Oracle Platform Services instance.

Scenario 2: I have an existing VCN in Oracle Cloud Infrastructure that I want to use for my Oracle Platform Services instance

You can use an existing VCN. The VCN must have at least one public subnet. Perform these tasks to complete the prerequisites:

Permit Oracle Platform Services to access resources

1. In the Console, navigate to the root compartment of your tenancy by clicking your tenancy name in the **Compartment** list.
2. Open the navigation menu. Under **Governance and Administration**, go to **Identity** and click **Policies**.
3. Click **Create Policy**.

4. Enter the following:
    - **Name:** A unique name for the policy. The name must be unique across all policies in your tenancy. You cannot change this later.
    - **Description:** A friendly description. You can change this later if you want to.
    - **Policy Versioning:** Select **Keep Policy Current** if you'd like the policy to stay current with any future changes to the service's definitions of verbs and resources. Or if you'd prefer to limit access according to the definitions that were current on a specific date, select **Use Version Date** and enter that date in YYYY-MM-DD format. For more information, see Policy Language Version.
    - **Statement:** To allow Oracle Platform Services access to use the network, enter the following policy. Click **+** after each statement to add another. In each statement, replace *<compartment_name>* with the name of the compartment where your VCN resides.

      ```
      Allow service PSM  to inspect vcns in compartment <compartment_name>
      ```

      ```
      Allow service PSM  to use subnets in compartment <compartment_name>
      ```

      ```
      Allow service PSM  to use vnics in compartment <compartment_name>
      ```

      ```
      Allow service PSM  to manage security-lists in compartment <compartment_name>
      ```

      For more information about policies, see Policy Basics and also Policy Syntax.
5. (Optional) If you want to enable the use of an Autonomous Transaction Processing or Oracle Cloud Infrastructure Database instance in your compartment as the infrastructure schema database for your Oracle Java Cloud Service instance, then add the following statements:

   ```
   Allow service PSM to inspect autonomous-database in compartment <compartment_name>
   ```

   ```
   Allow service PSM to inspect database-family in compartment <compartment_name>
   ```
6. Click **Create**.

Create a bucket

1. Open the **Region** menu and select the region in which you want to create the Oracle PaaS service instance.
   Select a region that's within the default data region of your account. For example, if your default data region is EMEA, then select eu-frankfurt-1 or uk-london-1.
2. Open the navigation menu. Under **Core Infrastructure**, click **Object Storage**.
3. Choose the compartment you want to create the bucket in.
4. Click **Create Bucket**.
5. In the **Create Bucket** dialog, enter a bucket name, for example: `PaasBucket`. Make a note of the name you enter. You will need it when you create an instance for your Oracle Platform Service later.
6. Click **Create Bucket**.

Set up credentials to use with Object Storage

For Big Data Cloud, set up an API signing key:

Set up an API signing key

Follow the instructions in this topic: Required Keys and OCIDs.

For all other services, create an auth token. Note that your service might refer to this credential as a Swift password. Use the auth token wherever you are asked to provide a Swift password.

Create an auth token

1. View the user's details:

- If you're creating an auth token for yourself: Open the **User** menu () and click **User Settings**.
- If you're an administrator creating an auth token for another user: In the Console, click **Identity**, and then click **Users**. Locate the user in the list, and then click the user's name to view the details.

2. On the left side of the page, click **Auth Tokens**.
3. Click **Generate Token**.
4. Enter a friendly description for the token and click **Generate Token**.
   The new token is displayed.
5. Copy the auth token immediately, because you can't retrieve it again after closing the dialog box. Also, make sure you have this token available when you create your Oracle Platform Services instance.

Information About Supported Platform Services

The following table lists the services supported on Oracle Cloud Infrastructure and links to more information about using those services on Oracle Cloud Infrastructure:

Service	More Information
Autonomous Analytics Cloud	About Oracle Autonomous Analytics Cloud
Autonomous API Platform Cloud Service	Using Oracle Autonomous API Platform Cloud Service
Autonomous Data Warehouse Cloud	About Autonomous Data Warehouse Cloud
Integration Cloud	Oracle Integration Cloud

Service	More Information
Autonomous Mobile Cloud Enterprise	About Oracle Autonomous Mobile Cloud Enterprise
NoSQL Database Cloud	Oracle NoSQL Database Cloud
Oracle Visual Builder	Administering Oracle Visual Builder
Big Data Cloud	About Big Data Cloud Clusters in Oracle Cloud Infrastructure
Content and Experience Cloud	Administering Oracle Content and Experience Cloud
Data Hub Cloud Service	About Oracle Data Hub Cloud Service Clusters in Oracle Cloud Infrastructure
Data Integration Platform Cloud	What is Oracle Data Integration Platform Cloud
Database Cloud Service	About Database Deployments in Oracle Cloud Infrastructure
Developer Cloud Service	About Oracle Developer Cloud Service in Oracle Cloud Infrastructure
Event Hub Cloud Service	About Oracle Event Hub Cloud Service - Dedicated Instances in Oracle Cloud Infrastructure
Java Cloud Service	About Java Cloud Service Instances in Oracle Cloud Infrastructure
MySQL Cloud Service	About MySQL Cloud Service Deployments in Oracle Cloud Infrastructure
Oracle SOA Cloud Service	About SOA Cloud Service Instances in Oracle Cloud Infrastructure Classic and Oracle Cloud Infrastructure

Billing and Payment Tools Overview

Oracle Cloud Infrastructure provides various billing and payment tools that make it easy to manage your service costs.

Budgets

Budgets can be used to set thresholds for your Oracle Cloud Infrastructure spending. You can set alerts on your budget to let you know when you might exceed your budget, and you can view all of your budgets and spending from one single place in the Oracle Cloud Infrastructure console.

See Budgets Overview for more information.

Cost Analysis

Cost Analysis provides easy-to-use visualization tools to help you track and optimize your Oracle Cloud Infrastructure spending. For more information, see Checking Your Balance and Usage.

Usage Reports

A usage report is a comma-separated value (CSV) file that can be used to get a detailed breakdown of resources in Oracle Cloud Infrastructure for audit or invoice reconciliation.

For more information, see Usage Reports Overview.

Payment Methods

The Payment Method section of the Oracle Cloud Infrastructure Console allows you to easily manage how you pay for your Oracle Cloud Infrastructure usage.

For more information, see Changing Your Payment Method.

Built 5/24/2019 8:10 AM

Budgets Overview

A budget can be used to set soft limits on your Oracle Cloud Infrastructure spending. You can set alerts on your budget to let you know when you might exceed your budget, and you can view all of your budgets and spending from one single place in the Oracle Cloud Infrastructure console.

How Budgets Work

Budgets are set on compartments (including the root compartment) to track all spending in that compartment and its children, so it's important to structure resources into compartments if you want to create granular budgets.

All budgets alerts are evaluated every 15 minutes. To see the last time a budget was evaluated, open the details for a budget. You will see fields that show the current spend, the forecast and the "Spent in period" field which shows you the time period over which the budget was evaluated. When a budget alert fires, the email recipients configured in the budget alert receive an email.

Budget Concepts

The following concepts are essential to working with budgets:

Budget

A monthly threshold you define for your Oracle Cloud Infrastructure spending. Budgets are set on compartments and track all spending in the compartment and any child compartments. Note: the budget tracks spending in the specified target compartment, but you need to have permissions to manage budgets in the root compartment of the tenancy to create and use budgets.

Alert

You can define email alerts that get sent out for your budget. You can send a customized email message body with these alerts. Alerts are evaluated every 15 minutes, and can be triggered when your actual or your forecasted spending hits either a percentage of your budget or a specified set amount.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies.

To use budgets, you must be in a group that can use "usage-budgets" in the tenancy (which is the root compartment) or be able to use all resources in the tenancy. All budgets are created in the root compartment, regardless of the compartment they are targeting, so IAM policies that grant budget permissions outside of the root will not be meaningful.

IAM Policy	Description
Allow group accountants to inspect usage-budgets in tenancy	Accountants can inspect budgets including spend.
Allow group accountants to read usage-budgets in tenancy	Accountants can read budgets including spend (same as list).
Allow group accountants to use usage-budgets in tenancy	Accountants can create and edit budgets and alerts rules.
Allow group accountants to manage usage-budgets in tenancy	Accountants can create, edit, and delete budgets and alerts rules.

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Managing Budgets

This topic discusses how to view and manage your budgets.

USING THE CONSOLE

To create a budget

1. Open the navigation menu. Under **Governance and Administration**, go to **Billing** and click **Budgets**.
2. Click **Create Budget** at the top of the budgets list.
3. In the **Create Budget** dialog, configure your budget:
    a. Select a target compartment for your budget from the **Target Compartment** drop-down list. Note that while the budget tracks spending in the specified target compartment, but you need to have permissions to manage budgets in the root compartment of the tenancy to create and use budgets.

b. Enter a name for your budget in the **Name** text field. The name can only contain alphanumeric characters, dashes, and the underscore character, and can't begin with a number.

c. Enter a monthly amount for your budget in the **Monthly Budget Amount** field. The minimum allowed value for your monthly budget is 1; the maximum allowed value is 999,999,999,999.

4. You can optionally create an alert for your budget by creating a budget alert rule. In the Budget Alert Rule panel on the Create Budget dialog, configure your alert rule:

   a. Select a threshold for your alert from the **Threshold Metric** drop-down list. There are two possible values:

      Actual Spend will watch the actual amount you spend in your compartment per month;

      Forecast Spend will watch your resource usage and alert you when it appears that you'll exceed your budget. The forecast algorithm is linear extrapolation and requires at least 3 days of consumption to trigger

   b. Select a threshold type from the **Threshold Type** drop-down list. You can select either a percentage of your monthly budget (which must be greater than 0 and no greater than 10,000) or a fixed amount.

   c. The label of the next text field changes depending on what type of threshold you selected. Enter either a **Threshold %** or a **Threshold Amount**.

   d. In the **Email Recipients** field, enter one or more email addresses to receive the alerts. Multiple addresses can be separated using a comma, semicolon, space, tab, or new line.

   e. Enter the body of your email alert in the **Email Message** field. The text of the email message cannot exceed 1000 characters. This message will be included with metadata about your budget, including the budget name, the compartment, and the amount of your monthly budget. You can use this message to for things like providing instructions to the recipient that explain how to request a budget increase or reminding users about corporate policies.

5. **Advanced Options (optional):** Click the **Show Advanced Options** link to add **Tags** to your Budget. Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
6. Click the **Create** button to create your budget.

To view or edit a budget

1. Open the navigation menu. Under Governance and Administration, go to Billing and click **Budgets**.
2. From the list of budgets, click on the budget you want to edit. The budget detail screen will appear.
3. Click the **Edit** button. The **Edit Budget** dialog will appear.
4. You can edit the name of your budget or the budget amount.
5. When you are finished, click **Save Changes**.

To delete a budget

1. From the list of budgets, select **Delete** from the context menu, or click the **Delete** button at the top of budget detail screen. The **Confirm Delete** dialog will appear.
2. Click the **Confirm** button to delete the budget, or cancel by clicking **Cancel**.

To manage tags for a budget

1. Open the navigation menu. Under Governance and Administration, go to Billing and click **Budgets**.
2. From the list of budgets, click on the budget you want to tag. The budget detail screen will appear.

3. Click the **Add tag(s)** button to add a tag.
4. Click the the **Tags** tab and then click on the pencil icon next to a tag you want to edit or remove.

USING THE API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operation to manage budgets:

- ListBudgets
- GetBudget
- CreateBudget
- DeleteBudget
- UpdateBudget

Managing Budget Alert Rules

You can set email alerts on your budgets. You can set alerts that are based on a percentage of your budget or an absolute amount, and on your actual spending or your forecast spending.

This topic covers how to view and manage your budget alert rules.

REQUIRED IAM POLICY

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies.

USING THE CONSOLE

To create a budget alert rule

1. Click the budget that you want to create an alert for from the budgets list.
2. In the **Budget Alert Rules** panel at the bottom of the screen, click the **Create Budget Alert Rule** button.
3. Configure your alert rule:
    a. Select a threshold for your alert from the **Threshold Metric** drop-down list. There are two possible values:

    Actual Spend will watch the actual amount you spend in your compartment per month;

    Forecast Spend will watch your resource usage and alert you when it appears that you'll exceed your budget. The forecast algorithm is linear extrapolation and requires at least 3 days of consumption to trigger

    b. Select a threshold type from the **Threshold Type** drop-down list. You can select either a percentage of your monthly budget (which must be greater than 0 and no greater than 10,000) or a fixed amount.

    c. The label of the next text field changes depending on what type of threshold you selected. Enter either a **Threshold %** or a **Threshold Amount**.

    d. In the **Email Recipients** field, enter one or more email addresses to receive the alerts. Multiple addresses can be separated using a comma, semicolon, space, tab, or new line.

    e. Enter the body of your email alert in the **Email Message** field. The text of the email message cannot exceed 1000 characters. This message will be included with metadata about your budget, including the budget name, the compartment, and the amount of your monthly budget. You can use this message to for things like providing instructions to the recipient that explain how to request a budget increase or reminding users about corporate policies.
4. Click the **Create** button to create your alert.

To view or edit a budget alert rule

1. In the list of budget alert rules, click the menu icon at the right side of the list and select **View/Edit** from the context menu.
2. Edit your alert rule.
3. Confirm your changes by clicking **Save Changes**, or dismiss the dialog without saving by clicking the **Cancel** button.

To delete a budget alert rule

1. In the list of budget alert rules, click the menu icon at the right side of the list and select **Delete** from the context menu.
2. Confirm or cancel the delete operation in the **Confirm Delete** dialog by clicking either the **Confirm** or **Cancel** button.

USING THE API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operation to manage budget alert rules:

- ListAlertRules
- GetAlertRule
- CreateAlertRule
- DeleteAlertRule
- UpdateAlertRule

Usage Reports Overview

A usage report is a comma-separated value (CSV) file that can be used to get a detailed breakdown of your Oracle Cloud Infrastructure resources for audit or invoice reconciliation.

How Usage Reports Work

The usage report is automatically generated daily, and is stored in an Oracle-owned object storage bucket. It contains one row per each Oracle Cloud Infrastructure resource (such as instance, object storage bucket, VNIC) per hour along with consumption information, metadata, and tags. Usage reports generally contain 24 hours of usage data, although occasionally a usage report may contain late-arriving data that is older than 24 hours.

Usage reports are retained for one year.

The file name for each usage report is appended with an automatically incrementing numerical value.

Usage Report Schema

The following table shows the usage report schema.

Field Name	Description
`lineItem/referenceNo`	Line identifier. Used for debugging and corrections.
`lineItem/TenantId`	The identifier (OCID) for the Oracle Cloud Infrastructure tenant.
`lineItem/intervalUsageStart`	The start time of the usage interval for the resource in UTC.
`lineItem/intervalUsageEnd`	The end time of the usage interval for the resource in UTC.
`product/service`	The service that the resource is in.
`product/resource`	The resource name used by the metering system.
`product/compartmentId`	The ID of the compartment that contains the resource.

Field Name	Description
product/compartmentName	The name of the compartment that contains the resource.
product/region	The region that contains the resource.
product/availabilityDomain	The availability domain that contains the resource.
product/resourceId	The identifier for the resource.
usage/consumedQuantity	The quantity of the resource that has been consumed over the usage interval.
usage/billedQuantity	The quantity of the resource that has been billed over the usage interval.
usage/consumedQuantityUnits	The unit for the consumed quantity and billed quantity.
usage/consumedQuantityMeasure	The measure for the consumed quantity and billed quantity.
lineItem/isCorrection	For future use. Used if the current line is a correction.
tags/	The usage report contains one column per tag definition (includes all tag definitions, not just cost tracking tags).

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have

permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Accessing Usage Reports

A usage report is a comma-separate value (CSV) file that is generated daily and stored in an object storage bucket. This topic describes how to access usage reports.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies.

Reports are generated in another tenancy and stored in an Oracle-owned object storage bucket. You must set up a cross-tenancy IAM policy to access your usage reports as shown below, changing the group name as appropriate:

```
define tenancy usage-report as
ocid1.tenancy.oc1..aaaaaaaaned4fkpkisbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhqkggq
endorse group MyGroupName to read objects in tenancy usage-report
```

USING THE CONSOLE

To download a usage report

1. Open the navigation menu. Under **Governance and Administration**, go to **Billing** and select **Usage Report**.
2. Click the report you want to download from the list, and follow your brower's instructions for downloading.

USING THE API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

To download a usage report, use the Object Storage APIs. The reports are stored in the tenancy's home region. The object storage namespace used for the reports is `bling`; the bucket name is the tenancy OCID.

The following example shows how to download a usage report using a Python script:

```
import oci
import os

# This script downloads all of the usage reports for a tenancy (specified in the config file)
#
# Pre-requisites: Create an IAM policy to endorse users in your tenancy to read usage reports from the
OCI tenancy
#
# Example policy:
# define tenancy usage-report as
```

```
ocid1.tenancy.oc1..aaaaaaaaned4fkpkisbwjlr56u7cj63lf3wffbilvqknstgtvzub7vhqkggq
# endorse group group_name to read objects in tenancy usage-report
#
# Note - the only value you need to change is group name. Do not change the OCID in the first statement

       usage_report_namespace = 'bling'

       # Update these values
       destintation_path = 'downloaded_reports'

       # Make a directory to receive reports
       if not os.path.exists(destintation_path):
       os.mkdir(destintation_path)

       # Get the list of usage reports
       config = oci.config.from_file('config/config','DEFAULT')
       usage_report_bucket = config['tenancy']
       object_storage = oci.object_storage.ObjectStorageClient(config)
       report_bucket_objects = object_storage.list_objects(usage_report_namespace, usage_report_bucket)

       for o in report_bucket_objects.data.objects:
          print('Found file ' + o.name)
          object_details = object_storage.get_object(usage_report_namespace,usage_report_bucket,o.name)
          filename = o.name.rsplit('/', 1)[-1]

       with open(destintation_path + '/' + filename, 'wb') as f:
          for chunk in object_details.data.raw.stream(1024 * 1024, decode_content=False):
             f.write(chunk)

       print('Finished downloading ' + o.name + '\n')
```

Console Cookies and Local Storage

The Oracle Cloud Infrastructure console uses browser cookies and local storage as detailed below.

Oracle Cloud Infrastructure Console Login Page Cookies

Name	Purpose	Duration	Impact of Disabling
bmc_ tenancy	Tracks the default tenancy for the OCI Console login page	30 days	The last-used tenancy is not tracked, and users are asked to specify a tenancy when logging into the OCI Console

Oracle Cloud Infrastructure Console Local Storage

Name	Purpose	Duration	Impact of Disabling
hg-session-*<userid>* :*<session>*	UI State information, includes selected region, active compartment and other UI state	Never expires	Console UI may not work optimally
recorded-events	Temporary cache of console usage data. Does not include any sensitive information.	Never expires	Console usage not recorded for analysis and product improvement purposes
recorded-metrics	Temporary cache of console metrics (for example, page load time)	Never expires	Console metrics not recorded for analysis and product improvement purposes

Oracle Cloud Infrastructure Console Cookies

Name	Purpose	Duration	Impact of Disabling
s_fid	Adobe Analytics unique visitor information, anonymous	2 years	Cannot track users across different Oracle products (OCI, Cloud Marketplace)
s_nr	Adobe Analytics unique visitor information, anonymous	2 years	Cannot track users across different Oracle products (OCI, Cloud Marketplace)
gpw_e24	Records and saves the previously accessed URL (anonymous)	Never expires	Console metrics not recorded for analysis and product improvement purposes

Oracle Cloud Infrastructure Console Local Storage - Indexed DB

Table	Field	Purpose
duplo - *<tenancy ocid>*	activeCompartmentId	Stores the compartment a user has selected in the UI
duplo - *<tenancy ocid>*	activeRegionId	Stores the region a user has selected in the UI
duplo - *<tenancy ocid>*	selectedLocale	Stores the user's current locale

Table	Field	Purpose
opc-key-store	key	Signed ID token (carries user identity information) and a signed security token (carries transient user public key as a JSON Web Key) used for signed request calls to API end points. The security token expires after 24 hours, at which point the user will be prompted to log in again.
opc-key-store-v2	key	Signed ID token (carries user identity information) and a signed security token (carries transient user public key as a JSON Web Key) used for Signed Request calls to API end points. The security token expires after 24 hours, at which point the user will be prompted to log in again.

My Services Use Cases

Oracle's My Services dashboard is a place to check the overall status of your purchased services and manage your accounts or subscriptions, including Oracle Cloud Infrastructure. You can navigate directly to My Services from the Console: Open the navigation menu. Under **Solutions, Platform and Edge**, click **My Services Dashboard**.

To interact programmatically with My Services, you can use the Oracle Cloud My Services API. To help you get started, here are some use cases:

- Service Discovery Use Case
- Exadata Use Cases
- Managing Exadata Instances
- Using Access Token Authorization with My Services API

Service Discovery Use Case

This use case shows how you can get the list of your service entitlement IDs.

Discover Current Service Entitlement IDs

Many of the My Services API operations require you to specify the `serviceEntitlementId`. To get the list of all your service entitlement IDs, use the GET ServiceEntitlements operation. This operation returns information that you can use to make more specific requests using the Oracle Cloud My Services API.

Example:

```
GET /itas/<domain>/myservices/api/v1/serviceEntitlements
```

Note

In the examples, *<domain>* is the identity domain ID. An identity domain ID can be either the *IDCS GUID* that identifies the identity domain for the users within Identity Cloud Service (IDCS) or the *Identity Domain name* for a traditional Cloud Account.

To obtain the IDCS GUID

Go to the Users page in My Services dashboard and click **Identity Console**. The URL in the browser address field displays the IDCS GUID for your identity domain. For example:

```
https://idcs-
105bbbdfe5644611bf7ce04496073adf.identity.oraclecloud.com/ui/v
1/adminconsole/?root=users
```

In the above URL, `idcs-105bbbdfe5644611bf7ce04496073adf` is the IDCS GUID for your identity domain.

Example payload returned for this request:

```
{
     "items": [
         {
             "id": "cesi-511202718",                          // Unique ServiceEntitlementId
             "purchaseEntitlement": {                         // Purchase Entitlement is the entity
bought by a customer
                 "subscriptionId": "511203590",
                 "id": "511203590",
                 "canonicalLink": "/itas/<domain>/myservices/api/v1/purchaseEntitlements/511203590"
             },
             "serviceDefinition": {
                 "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceDefinitions/500089778",
```

```
                "id": "500089778",
                "name": "Storage"                           // The customer is entitled to use the
Storage Service
            },
            "createdOn": "2017-12-20T16:23:23.326Z",

            "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceEntitlements/cesi-511202719"
        },
        ...                                                 // More Service Entitlements could be
displayed
    ],
 "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceEntitlements",
 "hasMore": false,
 "limit": 25,
 "offset": 0
 }
```

Exadata Use Cases

The following use case examples can get you started working with the Exadata operations available in the Oracle Cloud My Services API.

Important

These use cases are for use with Oracle Database Exadata Cloud Service. For more information, see Administering Oracle Database Exadata Cloud Service. These use cases **DO NOT** apply to Exadata DB Systems available in Oracle Cloud Infrastructure.

Exadata Firewall Whitelisting

To enable access to your Exadata Cloud Service instance, you can configure security rules and associate them with your instance. The security rules define a whitelist of allowed network access points.

The firewall provides a system of rules and groups. By default, the firewall denies network access to the Exadata Cloud Service instance. When you enable a security rule, you enable access to the Exadata Cloud Service instance. To enable access you must:

- Create a security group and create security rules that define specific network access allowances.
- Assign the security group to your Exadata Cloud Service instance.

You can define multiple security groups, and each security group can contain multiple security rules. You can associate multiple security groups with each Exadata Cloud Service instance, and each security group can be associated with multiple Exadata Cloud Service instances. You can dynamically enable and disable security rules by modifying the security groups that are associated with each Exadata Cloud Service instance.

To enable access to an Exadata Cloud Service instance:

Note

In the following examples, *<domain>* is the identity domain ID. An identity domain ID can be either the *IDCS GUID* that identifies the identity domain for the users within Identity Cloud Service (IDCS) or the *Identity Domain name* for a traditional Cloud Account.

To obtain the IDCS GUID

Go to the Users page in My Services dashboard and click **Identity Console**. The URL in the browser address field displays the IDCS GUID for your identity domain. For example:

```
https://idcs-
105bbbdfe5644611bf7ce04496073adf.identity.oraclecloud.com/ui/v
1/adminconsole/?root=users
```

In the above URL, `idcs-105bbbdfe5644611bf7ce04496073adf` is the IDCS GUID for your identity domain.

1. Get the service instance IDs.
   Operation: GET ServiceInstances

Example

Example request:

```
GET
/itas/<domain>/myservices/api/v1/serviceInstances?serviceDefinitionNames=Exadata&statuses=ACTIVE
```

Example payload returned for this request:

```
{
  "items": [
    {
      "id": "csi-585928949",               // Unique ServiceInstanceId
      "serviceEntitlement": {
      "id": "cesi-585927251",
      "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceEntitlements/cesi-585927251"
    },
    "serviceDefinition": {
      "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceDefinitions/502579309",
      "id": "502579309",
      "name": "Exadata"                // The customer is entitled to use the Exadata Service
    },
    "cloudAccount": {
      "canonicalLink": "/itas/<domain>/myservices/api/v1/cloudAccounts/cacct-fd7a122448aaaa",
      "id": "cacct-fd7a122448aaaa",
      "name": "myAccountName"
    },
    ...
    "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-585928949"
  }
...                                          // More Service Instances could be displayed
  ],
"canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances",
"hasMore": false,
"limit": 25,
"offset": 0
}
```

This example payload returns the service instance ID csi-585928949, which is part of the service entitlement ID cesi-585927251.

2. Get the service configuration IDs.
   Operation: GET SIServiceConfigurations

Example

Example request, using the service instance ID csi-585928949:

```
GET /itas/<domain>/myservices/api/v1/serviceInstances/csi-585928949/serviceConfigurations
```

Example payload returned for this request:

```
{
 "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations",
 "items": [
   {
     "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata",
      "exadata": {
      "bursting": {
        "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata/bursting"
      },
     "id": "Exadata",
     "securityGroupAssignments": {
     "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata/securityGroupAssignments"
     }
   },
   "id": "Exadata"
   }
 ]
}
```

This example payload shows that /itas/*<domain>*/myservices/api/v1/serviceInstances/csi-585928949/serviceConfigurations/Exadata/securityGroupAssignments is used for Exadata Firewall.

3. Get the current security groups for the service entitlement.
   Operation: GET SEExadataSecurityGroups

Example

Example request, using the service entitlement ID cesi-585927251:

```
GET /itas/<domain>/myservices/api/v1/serviceEntitlements/cesi-
585927251/serviceConfigurations/Exadata/securityGroups
```

Example payload returned for this request:

```
{
  "items": [
    {
      "id": "1",
      "customerId": "585927251",
      "name": "SecGroup 1",
      "description": "My first Security group",
      "version": 10,
      "rules": [
        {
          "direction": "ingress",
          "proto": "tcp",
          "startPort": 1159,
          "endPort": 1159,
          "ipSubnet": "0.0.0.0/0",
          "ruleInterface": "data"
        }
      ],
      "canonicalLink":
"/itas/
<domain>
/myservices/api/v1/serviceEntitlements/585927251/serviceConfigurations/Exadata/securityGroups/1"
    },
    {
      "id": "2",
      "customerId": "585927251",
      "name": " SecGroup 2",
      "description": "My second Security group",
      "version": 3,
      "rules": [
        {
          "direction": "egress",
          "proto": "tcp",
          "startPort": 8123,
          "endPort": 8123,
```

```
          "ipSubnet": "192.168.1.0/28",
          "ruleInterface": "data"
        }
      ],
      "canonicalLink":
"/itas/
<domain>
/myservices/api/v1/serviceEntitlements/585927251/serviceConfigurations/Exadata/securityGroups/2"
    }
  ],
  "canonicalLink":
"/itas/
<domain>
/myservices/api/v1/serviceEntitlements/585927251/serviceConfigurations/Exadata/securityGroups"
}
```

This example payload shows two security groups defined for the specified service entitlement ID.

4. Get the current security group assignments for the service instance
   Operation: GET SIExadataSecurityGroupAssignments

Example

Example request, using the service instance ID csi-585928949:

```
GET /itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata/securityGroupAssignments
```

Example payload returned for this request:

```
{
  "items": [
    {
      "id": "11",
      "securityGroup":
      {
        "id": "1",
        "canonicalLink":
"/itas/
```

```
<domain>
/myservices/api/v1/serviceEntitlements/585927251/serviceConfigurations/Exadata/securityGroups/1"
      },
      "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata/securityGroupAssignments/11"
    }
  ],
  "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata/securityGroupAssignments"
}
```

This example payload shows one security group assigned to the service instance csi-585928949.

5. Create a security group with security rules.
   Operation: POST SEExadataSecurityGroups

Example

Example request, using the service entitlement ID cesi-585927251:

```
POST /itas/<domain>/myservices/api/v1/serviceEntitlements/cesi-
585927251/serviceConfigurations/Exadata/securityGroups
{
   "customerId": "585927251",
   "name": "SecGroup 1",
   "description": "My third Security group",
   "version": 1,
   "rules": [
     {
       "direction": "ingress",
       "proto": "tcp",
       "startPort": 30,
       "endPort": 31,
       "ipSubnet": "100.100.100.255",
       "ruleInterface": "admin"
     },
     {
       "direction": "egress",
```

```
      "proto": "tcp",
      "startPort": 32,
      "endPort": 32,
      "ipSubnet": "100.100.255.0/16",
      "ruleInterface": "admin"
    }
  ]
}
```

Attributes:

Name	Description
customerId	Required: Yes String This must be the same as the *<serviceEntitlementId>*
direction	Required: Yes String Allowed values: [ingress | egress] for inbound or outbound.
proto	Required: Yes String Allowed values: [tcp | udp].
startPort	Required: Yes Integer startPort defines the beginning of a range of ports to open/white-list [0 - 65535].

Name	Description
endPort	Required: Yes Integer endPort defines the ending of a range of ports to open/white-list [0 - 65535].
ipSubnet	Required: Yes String Single IP address or range specified in CIDR notation.
ruleInterface	Required: Yes String Allowed values: [admin | client | backup] where: • admin — specifies that the rule applies to network communications over the administration network interface. The administration network is typically used to support administration tasks by using terminal sessions, monitoring agents, and so on. • client — specifies that the rule applies to network communications over the client access network interface, which is typically used by Oracle Net Services connections. • backup — specifies that the rule applies to network communications over the backup network interface, which is typically used to transport backup information to and from network-based storage that is separate from Exadata Cloud Service.

If successful, the POST request will return the unique ID of the newly created security group. For the next step, we'll assume that the newly created security group ID is 3.

Note

A security group can also be modified or deleted.
See Oracle Cloud My Services API.

6. Assign the security group to a service instance.
   Operation: POST SIExadataSecurityGroupAssignments

Example

Example request, using the service instance csi-585928949 and the security group ID 3:

```
POST /itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata/securityGroupAssignments

{
   "securityGroup": {
      "id": "3",
      "customerId": "585927251",
      "canonicalLink":
"/itas/
<domain>
/myservices/api/v1/serviceEntitlements/585927251/serviceConfigurations/Exadata/securityGroups/3"
   }
}
```

Attributes:

Name	Description
customerId	Required: Yes String This must be the same as the serviceEntitlementId.

If successful, the POST request will return the unique Id of the newly created security group assignment.

Note

A security group assignment can also be deleted. See Oracle Cloud My Services API.

You can now verify all your security groups and assignments. See:

- Get the current security groups for the service entitlement.
- Get the current security group assignments for the service instance .

Exadata Scaling with Bursting

You can temporarily modify the capacity of your Exadata environment by configuring bursting. Bursting is a method you can use to scale Exadata Cloud Service non-metered instances within an Exadata system.

To scale up your non-metered instances, increase the number of compute nodes by modifying the `burstOcpu` attribute of the host. When you no longer need the additional nodes, update the `burstOcpu` attribute back to its original setting.

Note

In the following examples, *<domain>* is the identity domain ID. An identity domain ID can be either the *IDCS GUID* that identifies the identity domain for the users within Identity Cloud Service (IDCS) or the *Identity Domain name* for a traditional Cloud Account.

To obtain the IDCS GUID

Go to the Users page in My Services dashboard and click **Identity Console**. The URL in the browser address field displays the IDCS GUID for your identity domain. For example:

```
https://idcs-
105bbbdfe5644611bf7ce04496073adf.identity.oraclecloud.com/ui/v
1/adminconsole/?root=users
```

In the above URL, `idcs-105bbbdfe5644611bf7ce04496073adf` is the IDCS GUID for your identity domain.

1. Get the service instance IDs.
   Operation: GET ServiceInstances

Example

Example request:

```
GET
/itas/<domain>/myservices/api/v1/serviceInstances?serviceDefinitionNames=Exadata&statuses=ACTIVE
```

Example payload returned for this request:

```
{
  "items": [
    {
      "id": "csi-585928949",               // Unique ServiceInstanceId
      "serviceEntitlement": {
      "id": "cesi-585927251",
      "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceEntitlements/cesi-585927251"
    },
    "serviceDefinition": {
      "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceDefinitions/502579309",
      "id": "502579309",
      "name": "Exadata"                // The customer is entitled to use the Exadata Service
    },
    "cloudAccount": {
      "canonicalLink": "/itas/<domain>/myservices/api/v1/cloudAccounts/cacct-fd7a122448aaaa",
      "id": "cacct-fd7a122448aaaa",
      "name": "myAccountName"
    },
    ...
    "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-585928949"
  }
...                                          // More Service Instances could be displayed
  ],
"canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances",
"hasMore": false,
"limit": 25,
"offset": 0
}
```

This example payload returns the service instance ID csi-585928949.

2. Get the service configuration IDs.
   Operation: GET SIServiceConfigurations

Example

Example request, using the service instance ID csi-585928949:

```
GET /itas/<domain>/myservices/api/v1/serviceInstances/csi-585928949/serviceConfigurations
```

Example payload returned for this request:

```
{
 "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations",
 "items": [
   {
     "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata",
      "exadata": {
      "bursting": {
        "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata/bursting"
      },
     "id": "Exadata",
     "securityGroupAssignments": {
     "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata/securityGroupAssignments"
     }
   },
   "id": "Exadata"
   }
 ]
}
```

This example payload shows that /itas/*<domain>*/myservices/api/v1/serviceInstances/csi-585928949/serviceConfigurations/Exadata/securityGroupAssignments is used for Bursting.

3. Get the current compute node configuration.
   Operation: GET SIExadataBursting

Example

Example request, using the service instance ID csi-585928949:

```
GET /itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata/bursting
```

Example payload returned for this request:

```
{
   "ocpuOpInProgress": false,
   "exaunitId": 50,
   "ocpuAllocations": [
       {
          "hostName": "host1.oraclecloud.com",
          "subscriptionOcpu": 11,
          "meteredOcpu": 0,
          "burstOcpu": 0,                                  // Current Burst value
          "minOcpu": 11,
          "maxOcpu": 42,
          "maxBurstOcpu": 11,
          "maxSubOcpu": 38,
          "maxMetOcpu": 0
       },
       {
          "hostName": "host2.oraclecloud.com",
          "subscriptionOcpu": 11,
          "meteredOcpu": 0,
          "burstOcpu": 0,                                  // Current Burst value
          "minOcpu": 11,
          "maxOcpu": 42,
          "maxBurstOcpu": 11,
          "maxSubOcpu": 38,
          "maxMetOcpu": 0
       }
       ],
   "status": 200,
   "op": "exaunit_coreinfo",
   "additionalNumOfCores": "0",
   "additionalNumOfCoresHourly": "0",
   "coreBursting": "Y"
}
```

4. Modify the values for `burstOcpu`.
   Operation: PUT SIExadataBursting
   You can modify `burstOcpu` to a value that is up to the value of `maxBurstOcpu`. This example adds two compute nodes to each host.

Example

Example request, using the service instance csi-585928949:

```
PUT /itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata/bursting/
{
   "ocpuOpInProgress": false,
   "exaunitId": 50,
   "ocpuAllocations": [
       {
          "hostName": "host1.oraclecloud.com",
          "subscriptionOcpu": 11,
          "meteredOcpu": 0,
          "burstOcpu": 2,
          "minOcpu": 11,
          "maxOcpu": 42,
          "maxBurstOcpu": 11,
          "maxSubOcpu": 38,
          "maxMetOcpu": 0
       },
       {
          "hostName": "host2.oraclecloud.com",
          "subscriptionOcpu": 11,
          "meteredOcpu": 0,
          "burstOcpu": 2,
          "minOcpu": 11,
          "maxOcpu": 42,
          "maxBurstOcpu": 11,
          "maxSubOcpu": 38,
          "maxMetOcpu": 0
       }
       ]
}
```

Attributes:

Name	Description
burstOcpu	Required: Yes Type: Integer, Minimum Value: 0, Maximum Value: maxBurstOcpu Number of additional cores

Note

This action may take a few minutes to complete.

5. Verify the new compute node configuration.
   Operation: GET SIExadataBursting

Example

Example request, using the service instance ID csi-585928949:

```
GET /itas/<domain>/myservices/api/v1/serviceInstances/csi-
585928949/serviceConfigurations/Exadata/bursting
```

Example payload returned for this request:

```
{
   "ocpuOpInProgress": false,
   "exaunitId": 50,
   "ocpuAllocations": [
       {
          "hostName": "host1.oraclecloud.com",
          "subscriptionOcpu": 11,
          "meteredOcpu": 0,
          "burstOcpu": 2,                    // New Burst value
          "minOcpu": 11,
          "maxOcpu": 42,
          "maxBurstOcpu": 11,
          "maxSubOcpu": 38,
          "maxMetOcpu": 0
```

```
      },
      {
         "hostName": "host2.oraclecloud.com",
         "subscriptionOcpu": 11,
         "meteredOcpu": 0,
         "burstOcpu": 2,                    // New Burst value
         "minOcpu": 11,
         "maxOcpu": 42,
         "maxBurstOcpu": 11,
         "maxSubOcpu": 38,
         "maxMetOcpu": 0
      }
      ],
  "status": 200,
  "op": "exaunit_coreinfo",
  "additionalNumOfCores": "0",
  "additionalNumOfCoresHourly": "0",
  "coreBursting": "Y"
}
```

Managing Exadata Instances

The following procedures walk you through creating, modifying, and deleting Exadata instances used with the Oracle Cloud My Services API.

Warning

Avoid entering confidential information when assigning descriptions, tags, or friendly names to your cloud resources through the Oracle Cloud Infrastructure Console, API, or CLI.

Important

These procedures are for use with Oracle Database Exadata Cloud Service. For more information, see Administering Oracle Database Exadata Cloud Service. These procedures **DO NOT** apply to Exadata DB Systems available in Oracle Cloud Infrastructure.

Prerequisites

Before you can manage Exadata instances, you need to:

- Subscribe to an Oracle Cloud service
- Obtain account credentials with required roles assigned
- Determine your API endpoint

To subscribe to an Oracle Cloud service

To access Oracle Cloud My Services API, you must request a trial or paid subscription to an Oracle Cloud service.

To obtain account credentials and role assignments

Ask your account administrator for the following items to access Oracle Cloud My Services API:

- Account credentials:
  - User name and password
  - Identity domain ID

An identity domain ID can be either the *IDCS GUID* that identifies the identity domain for the users within Identity Cloud Service (IDCS) or the *Identity Domain name* for a traditional Cloud Account.

- Required roles assigned to above user name

To determine your API endpoint

Insert the identity domain ID provided by the account administrator (*<domain>*) between `/itas/` and `/myservices/`.

Example:

```
https://itra.oraclecloud.com/itas/<domain>/myservices/api/v1/serviceEntitlements
```

Creating Exadata Instances

This section covers how to create a basic Exadata instance, an instance with custom IP network configuration, and an instance with multi-VM support.

To create a basic Exadata instance

Post a request with the required payload to create a new instance for a given service entitlement (Exadata in our case).

In the following example, *<domain>* is the identity domain ID.

```
POST /itas/<domain>/myservices/api/v1/operations
{
  "operationItems": [
    {
      "attributes": [
        {
          "name": "requestPayload.name",
          "value": "newinstanceName"
        },
        {
          "name": "requestPayload.serviceEntitlementId",
```

```
        "value": "500073421"
      },
      {
        "name": "requestPayload.size",
        "value": "CUSTOM"
      },
      {
        "name": "requestPayload.serviceType",
        "value": "Exadata"
      },
      {
        "name": "requestPayload.adminUserName",
        "value": "john.smith@example.com"
      },
      {
        "name": "requestPayload.adminEmail",
        "value": "john.smith@example.com"
      },
      {
        "name": "requestPayload.adminFirstName",
        "value": "John"
      },
      {
        "name": "requestPayload.adminLastName",
        "value": "Smith"
      },
      {
        "name": "requestPayload.invokerAdminUserName",
        "value": "john.smith@example.com"
      },
      {
        "name": "requestPayload.invokerAdminEmail",
        "value": "john.smith@example.com"
      },
      {
        "name": "requestPayload.invokerAdminFirstName",
        "value": "John"
      },
      {
        "name": "requestPayload.invokerAdminLastName",
        "value": "Smith"
```

```
        },
        {
          "name": "requestPayload.customAttributes.ExaUnitName",
          "value": "systemname"
        },
        {
          "name": "requestPayload.customAttributes.CreateSparse",
          "value": "N"
        },
        {
          "name": "requestPayload.customAttributes.BackupToDisk",
          "value": "N"
        },
        {
          "name": "requestPayload.customAttributes.isBYOL",
          "value": "N"
        },
        {
          "name": "requestPayload.customAttributes.PickRackSize",
          "value": "Quarter Rack"
        },
        {
          "name": "requestPayload.customAttributes.SELECTED_DC_ID",
          "value": "US001"
        }
      ],
        "operationItemDefinition": {
        "id": "CIM-Exadata-CUSTOM-PRODUCTION-CREATE"
      }
    }
  ]
}
```

ATTRIBUTES

Name	Description
requestPayload.name	Required: Yes Type: String Name of the Exadata instance. This name: • Must not exceed 25 characters. • Must start with a letter. • Must contain only lower case letters and numbers. • Must not contain spaces or any other special characters. • Must be unique within the identity domain.
requestPayload. serviceEntitlementId	Required: Yes Type: String Service Entitlement for the Exadata instance. See "Exadata Service Entitlement discovery". Note that any "cesi-" or "sub-" prefix should not be included.
requestPayload. customAttributes. ExaUnitName	Required: Yes Type: String A name for your Exadata Database Machine environment. This name is also used as the cluster name for the Oracle Grid Infrastructure installation.

Name	Description
requestPayload. customAttributes. CreateSparse	Required: Yes Type: String "Y" to create a disk group that is based on sparse grid disks, else "N". You must select this option to enable Exadata Cloud Service snapshots. Exadata snapshots enable space-efficient clones of Oracle databases that can be created and destroyed very quickly and easily.
requestPayload. customAttributes. BackupToDisk	Required: Yes Type: String "Y" to use "Database backups on Exadata Storage", else "N". This option configures the Exadata storage to enable local database backups on Exadata storage.
requestPayload. customAttributes. isBYOL	Required: Yes Type: String "Y" to indicate that the Exadata Cloud Service instance uses Oracle Database licenses that are provided by you rather than licenses that are provided are part of the service subscription, else "N". This option only affects the billing that is associated with the service instance. It has no effect on the technical configuration of the Exadata Cloud Service instance.

Name	Description
requestPayload. customAttributes. PickRackSize	Required: Yes Type: String Specify the rack configuration for your service instance. Exact allowed values depend on your purchase. Typical values are like "Full Rack", "Half Rack", "Quarter Rack" or "Eighth Rack".
requestPayload. customAttributes. SELECTED_DC_ID	Required: Yes Type: String Data center that will host your Exadata Cloud Service instance. See "Exadata Service Entitlement discovery" to obtain the Eligible Data Center IDs.

To create an Exadata instance with custom IP network configuration

Post a request with the attributes ClientNetwork and BackupNetwork as part of the payload. The following example includes these optional attributes as well as required attributes.

In the following example, *<domain>* is the identity domain ID.

```
POST /itas/<domain>/myservices/api/v1/operations
{
  "operationItems": [
    {
      "attributes": [
        {
          "name": "requestPayload.name",
          "value": "newinstanceName"
        },
        {
          "name": "requestPayload.serviceEntitlementId",
          "value": "500073421"
        },
```

```
        {
          "name": "requestPayload.size",
          "value": "CUSTOM"
        },
        {
          "name": "requestPayload.serviceType",
          "value": "Exadata"
        },
        {
          "name": "requestPayload.adminUserName",
          "value": "john.smith@example.com"
        },
        {
          "name": "requestPayload.adminEmail",
          "value": "john.smith@example.com"
        },
        {
          "name": "requestPayload.adminFirstName",
          "value": "John"
        },
        {
          "name": "requestPayload.adminLastName",
          "value": "Smith"
        },
        {
          "name": "requestPayload.invokerAdminUserName",
          "value": "john.smith@example.com"
        },
        {
          "name": "requestPayload.invokerAdminEmail",
          "value": "john.smith@example.com"
        },
        {
          "name": "requestPayload.invokerAdminFirstName",
          "value": "John"
        },
        {
          "name": "requestPayload.invokerAdminLastName",
          "value": "Smith"
        },
        {
```

```
          "name": "requestPayload.customAttributes.ExaUnitName",
          "value": "systemname"
        },
        {
          "name": "requestPayload.customAttributes.CreateSparse",
          "value": "N"
        },
        {
          "name": "requestPayload.customAttributes.BackupToDisk",
          "value": "N"
        },
        {
          "name": "requestPayload.customAttributes.isBYOL",
          "value": "N"
        },
        {
          "name": "requestPayload.customAttributes.PickRackSize",
          "value": "Quarter Rack"
        },
        {
          "name": "requestPayload.customAttributes.SELECTED_DC_ID",
          "value": "US001"
        }
        {
          "name": "requestPayload.customAttributes.ClientNetwork",
          "value": "/root/root/1/ipnetwork1"
        },
        {
          "name": "requestPayload.customAttributes.BackupNetwork",
          "value": "/root/root/1/ipnetwork2"
        }
      ],
        "operationItemDefinition": {
        "id": "CIM-Exadata-CUSTOM-PRODUCTION-CREATE"
      }
    }
  ]
}
```

ATTRIBUTES

Name	Description
requestPayload. customAttributes. ClientNetwork	Required: Yes Type: Url IP network definitions for the network that is primarily used for client access to the database servers. Applications typically access databases on Exadata Cloud Service through this network using Oracle Net Services in conjunction with Single Client Access Name (SCAN) and Oracle RAC Virtual IP (VIP) interfaces.
requestPayload. customAttributes. BackupNetwork	Required: Yes Type: Url IP network definitions for the network that is typically used to access the database servers for various purposes, including backups and bulk data transfers.

To create an Exadata instance with multi-VM support

If your Exadata system environment is enabled to support multiple virtual machine (VM) clusters, then you can define up to eight clusters and specify how the overall Exadata system resources are allocated to them.

In a configuration with multiple VM clusters, each VM cluster is allocated a dedicated portion of the overall Exadata system resources, with no over-provisioning or resource sharing. On the compute nodes, a separate VM is defined for each VM cluster, and each VM is allocated a dedicated portion of the available compute node CPU, memory, and local disk resources. Each VM cluster is also allocated a dedicated portion of the overall Exadata storage.

Post a request with the attributes EXAUNIT_ALLOCATIONS and MULTIVM_ENABLED as part of the payload. The following example includes these optional attributes as well as required attributes.

In the following example, *<domain>* is the identity domain ID and *<base64_encoded_string>* is a base64 encoding of the payload following the example.

Example payload for request:

```
POST /itas/<domain>/myservices/api/v1/operations
{
  "operationItems": [
    {
      "attributes": [
        {
          "name": "requestPayload.name",
          "value": "newinstanceName"
        },
        {
          "name": "requestPayload.serviceEntitlementId",
          "value": "500073421"
        },
        {
          "name": "requestPayload.size",
          "value": "CUSTOM"
        },
        {
          "name": "requestPayload.serviceType",
          "value": "Exadata"
        },
        {
          "name": "requestPayload.adminUserName",
          "value": "john.smith@example.com"
        },
        {
          "name": "requestPayload.adminEmail",
          "value": "john.smith@example.com"
        },
        {
          "name": "requestPayload.adminFirstName",
          "value": "John"
```

```
    },
    {
      "name": "requestPayload.adminLastName",
      "value": "Smith"
    },
    {
      "name": "requestPayload.invokerAdminUserName",
      "value": "john.smith@example.com"
    },
    {
      "name": "requestPayload.invokerAdminEmail",
      "value": "john.smith@example.com"
    },
    {
      "name": "requestPayload.invokerAdminFirstName",
      "value": "John"
    },
    {
      "name": "requestPayload.invokerAdminLastName",
      "value": "Smith"
    },
    {
      "name": "requestPayload.customAttributes.ExaUnitName",
      "value": "systemname"
    },
    {
      "name": "requestPayload.customAttributes.CreateSparse",
      "value": "N"
    },
    {
      "name": "requestPayload.customAttributes.BackupToDisk",
      "value": "N"
    },
    {
      "name": "requestPayload.customAttributes.isBYOL",
      "value": "N"
    },
    {
      "name": "requestPayload.customAttributes.PickRackSize",
      "value": "Quarter Rack"
    },
```

```
        {
          "name": "requestPayload.customAttributes.SELECTED_DC_ID",
          "value": "US001"
        }
        {
          "name": "requestPayload.customAttributes.EXAUNIT_ALLOCATIONS",
          "value": "<base64_encoded_string>"
        },
        {
          "name": "requestPayload.customAttributes.MULTIVM_ENABLED",
          "value": "true"
        }
      ],
        "operationItemDefinition": {
        "id": "CIM-Exadata-CUSTOM-PRODUCTION-CREATE"
      }
    }
  ]
}
```

Payload for *<base64_encoded_string>*:

```
{
  ExaunitProperties: [
    {name:requestId, value:27ac0ee3-0c72-4493-b02b-40038f07d2a0},
    {name:Operation, value:AddCluster},
    {name:TotalNumOfCoresForCluster, value:4},
    {name:TotalMemoryInGb, value:30},
    {name:StorageInTb, value:3},
    {name:OracleHomeDiskSizeInGb, value:60},
    {name:ClientNetwork, value:/root/root/1/ipnetwork1},  // Only if Higgs is also required
    {name:BackupNetwork, value:/root/root/1/ipnetwork2},  // Only if Higgs is also required
    {name:ExaUnitName, value:systemname},
    {name:CreateSparse, value:N},
    {name:BackupToDisk, value:N}
  ]
}
```

ATTRIBUTES

Name	Description
requestId	Required: Optional Type: String Unique UUID
TotalNumOfCores ForCluster	Required: Yes Type: String The number of CPU cores that are allocated to the VM cluster. This is the total number of CPU cores that are allocated evenly across all of the compute nodes in the VM cluster. Must be a multiple of numComputes as returned by a call to ecra/endpoint/clustershapes.
TotalMemoryInGb	Required: Yes Type: String The amount of memory (in GB) that is allocated to the VM cluster. This is the total amount of memory that is allocated evenly across all of the compute nodes in the VM cluster. Must be a multiple of numComputes as returned by a call to ecra/endpoint/clustershapes.

Name	Description
StorageInTb	Required: Yes Type: String The total amount of Exadata storage (in TB) that is allocated to the VM cluster. This storage is allocated evenly from all of the Exadata Storage Servers.
OracleHomeDiskSize InGb	Required: Yes Type: String The amount of local disk storage (in GB) that is allocated to each database server in the first VM cluster.

Modifying Exadata Instances

This section covers how to add a cluster to an existing instance, reshape a cluster, and delete a cluster.

To add a cluster to an existing instance

Post a request with the operationItemDefinition of CIM-Exadata-CUSTOM-PRODUCTION-UPDATE and a base64 encoding of a payload that includes the Operation value of AddCluster.

In the following example, *<domain>* is the identity domain ID, *<instanceId>* and *<serviceEntitlementId>* are returned from iTAS serviceInstances, and *<base64_encoded_string>* is a base64 encoding of the payload following the example.

Example payload for request:

```
POST /itas/<domain>/myservices/api/v1/operations HTTP/1.1
{
  "operationItems": [
    {
      "attributes": [
```

```
        {
          "name": "instanceId",
          "value": "<instanceId>"
        },
        {
          "name": "requestPayload.serviceEntitlementId",
          "value": "<serviceEntitlementId>"
        },
        {
          "name": "requestPayload.size",
          "value": "CUSTOM"
        },
        {
          "name": "requestPayload.serviceType",
          "value": "Exadata"
        },
        {
          "name": "requestPayload.customAttributes.EXAUNIT_ALLOCATIONS",
          "value": "<base64_encoded_string>"
        },
        {
          "name": "requestPayload.customAttributes. MULTIVM_ENABLED",
          "value": "true"
        }
      ],
        "operationItemDefinition": {
        "id": "CIM-Exadata-CUSTOM-PRODUCTION-UPDATE"
      }
    }
  ]
}
```

Payload for *<base64_encoded_string>*:

```
{
  ExaunitProperties: [
    {name:requestId, value:27ac0ee3-0c72-4493-b02b-40038f07d2a0},
    {name:Operation, value:AddCluster},
    {name:TotalNumOfCoresForCluster, value:4},
    {name:TotalMemoryInGb, value:30},
    {name:StorageInTb, value:3},
    {name:OracleHomeDiskSizeInGb, value:60},
```

```
    {name:ClientNetwork, value:/root/root/1/ipnetwork1},  // Only if Higgs is also required
    {name:BackupNetwork, value:/root/root/1/ipnetwork2},  // Only if Higgs is also required
    {name:ExaUnitName, value:Cluster2},
    {name:CreateSparse, value:N},
    {name:BackupToDisk, value:N}
  ]
}
```

To reshape a cluster

Post a request with the operationItemDefinition of CIM-Exadata-CUSTOM-PRODUCTION-UPDATE and a base64 encoding of a payload that includes the Operation value of ReshapeCluster.

In the following example, *<domain>* is the identity domain ID and *<base64_encoded_string>* is a base64 encoding of the payload following the example.

Example payload for request:

```
POST /itas/<domain>/myservices/api/v1/operations HTTP/1.1
{
  "operationItems": [
    {
      "attributes": [
        {
          "name": "instanceId",
          "value": "500076173"
        },
        {
          "name": "requestPayload.serviceEntitlementId",
          "value": "500073421"
        },
        {
          "name": "requestPayload.size",
          "value": "CUSTOM"
        },
        {
          "name": "requestPayload.serviceType",
          "value": "Exadata"
        },
```

```
        {
          "name": "requestPayload.customAttributes.EXAUNIT_ALLOCATIONS",
          "value": "<base64_encoded_string>"
        },
        {
          "name": "requestPayload.customAttributes. MULTIVM_ENABLED",
          "value": "true"
        }
      ],
        "operationItemDefinition": {
        "id": "CIM-Exadata-CUSTOM-PRODUCTION-UPDATE"
      }
    }
  ]
}
```

Payload for *<base64_encoded_string>*:

```
{
  ExaunitProperties: [
    {name:requestId, value:27ac0ee3-0c72-4493-b02b-40038f07d2a0},
       {name:ExaunitID, value:1},              // From ecra/endpoint/exaservice/{serviceInstance}/resourceinfo
    {name:Operation, value:ReshapeCluster},
    {name:TotalNumOfCoresForCluster, value:10},
    {name:TotalMemoryInGb, value:10},
    {name:StorageInTb, value:4},
    {name:OhomePartitionInGB, value:100},
    {name:ClientNetwork, value:/root/root/1/ipnetwork1},  // Only if Higgs is also required
    {name:BackupNetwork, value:/root/root/1/ipnetwork2}   // Only if Higgs is also required
  ]
}
```

Important

- Only one attribute can be modified per Reshape request. The payload should contain only the modified attribute. Example:

```
{ExaunitProperties:
[{name:Operation,value:ReshapeCluster},
{name:ExaunitID,value:5},
{name:TotalNumOfCoresForCluster,value:6}]}
```

- When doing a Reshape with the `OracleHomeDiskSizeInGb` attribute, use the name `OhomePartitionInGB`.
- The value for `TotalNumOfCoresForCluster` must be a multiple of `numComputes` as returned by a call to `ecra/endpoint/clustershapes`.
- The value for `TotalMemoryInGb` must be a multiple of `numComputes` as returned by a call to `ecra/endpoint/clustershapes`.

To delete a cluster

Post a request with the operationItemDefinition of CIM-Exadata-CUSTOM-PRODUCTION-UPDATE and a base64 encoding of a payload that includes the Operation value of DeleteCluster.

In the following example, *<domain>* is the identity domain ID and *<base64_encoded_string>* is a base64 encoding of the payload following the example.

Example payload for request:

```
POST /itas/<domain>/myservices/api/v1/operations HTTP/1.1
{
```

```
  "operationItems": [
    {
      "attributes": [
        {
          "name": "instanceId",
          "value": "500076173"
        },
        {
          "name": "requestPayload.serviceEntitlementId",
          "value": "500073421"
        },
        {
          "name": "requestPayload.size",
          "value": "CUSTOM"
        },
        {
          "name": "requestPayload.serviceType",
          "value": "Exadata"
        },
        {
          "name": "requestPayload.customAttributes.EXAUNIT_ALLOCATIONS",
          "value": "<base64_encoded_string>"
        },
        {
          "name": "requestPayload.customAttributes. MULTIVM_ENABLED",
          "value": "true"
        }
      ],
        "operationItemDefinition": {
        "id": "CIM-Exadata-CUSTOM-PRODUCTION-UPDATE"
      }
    }
  ]
}
```

Payload for *<base64_encoded_string>*:

```
{
  ExaunitProperties: [
    {name:requestId, value:27ac0ee3-0c72-4493-b02b-40038f07d202},  // Optional
       {name:ExaunitID, value:2},
    {name:Operation, value:DeleteCluster}
```

```
  ]
}
```

Deleting Exadata Instances

This section covers how to delete Exadata instances.

Important

Delete all existing multi-VM clusters before deleting the Exadata instance. Following this guidance prevents the instance ending up in an invalid state.

To delete an instance

Post a request with the operationItemDefinition of CIM-Exadata-CUSTOM-PRODUCTION-DELETE.

In the following example, *<domain>* is the identity domain ID.

Example payload for request:

```
POST /itas/<domain>/myservices/api/v1/operations HTTP/1.1
{
  "operationItems": [
    {
      "attributes": [
        {
          "name": "instanceId",
          "value": "500076173"
        },
        {
          "name": "requestPayload.serviceEntitlementId",
          "value": "500073421"
        },
        {
          "name": "requestPayload.serviceType",
```

```
          "value": "Exadata"
        }
      ],
        "operationItemDefinition": {
        "id": "CIM-Exadata-CUSTOM-PRODUCTION-DELETE"
      }
    }
  ]
}
```

Discovering Entitlements and Instances

This section describes how to discover service entitlements and service instances.

To discover service entitlements

Send the following request:

```
GET /itas/<domain>/myservices/api/v1/serviceEntitlements?serviceDefinitionNames=Exadata
```

Example payload returned for this request:

```
{
    "items": [
      {
        "id": "cesi-585927251",               // Unique ServiceEntitlementId
        "serviceDefinition": {
          "canonicalLink": "/itas/a517289/myservices/api/v1/serviceDefinitions/502579309",
          "id": "502579309",
          "name": "Exadata"                 // The customer is entitled to use the Exadata Service
        },
        "status": "ACTIVE",
        ...
        "canonicalLink": "/itas/a517289/myservices/api/v1/serviceInstances/csi-585928949"
      }
    ...                                              // More Service Entitlements could be displayed
    ],
  "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceEntitlements",
  "hasMore": false,
  "limit": 25,
```

```
  "offset": 0
}
```

Eligible Data Centers:

Use:

```
/itas/<domain>/myservices/api/v1/serviceEntitlements/
{ServiceEntitlementId}?expands=serviceInstancesEligibleDataCenters
```

where `{ServiceEntitlementId}` is a service entitlement ID such as `cesi-500074601`. This will provide additional information such as:

```
  "serviceInstancesEligibleDataCenters": [
    {
      "id": "US001"
    }
  ],
```

To discover service instances

Send the following request:

```
GET /<domain>/myservices/api/v1/serviceInstances?serviceDefinitionNames=Exadata
```

Example payload returned for this request:

```
{
    "items": [
      {
        "id": "csi-585928949",               // Unique ServiceInstanceId
        "serviceEntitlement": {
          "id": "cesi-585927251",          // Related ServiceEntitlementId
          "canonicalLink": "/itas/a517289/myservices/api/v1/serviceEntitlements/cesi-585927251"
        },
        "serviceDefinition": {
          "canonicalLink": "/itas/a517289/myservices/api/v1/serviceDefinitions/502579309",
          "id": "502579309",
          "name": "Exadata"                 // The customer is entitled to use the Exadata Service
        },
        ...
        "canonicalLink": "/itas/a517289/myservices/api/v1/serviceInstances/csi-585928949"
```

```
      }
    ...                                                  // More Service Entitlements could be displayed
    ],
  "canonicalLink": "/itas/<domain>/myservices/api/v1/serviceEntitlements",
  "hasMore": false,
  "limit": 25,
  "offset": 0
}
```

Using Access Token Authorization with My Services API

This topic explains how to set up and use access token authorization with the Oracle Cloud My Services API. Access token authorization allows a developer to access programmatic endpoints (APIs) to obtain some information (for example, entitlements, instances, or metering data) for your cloud account.

About Access Tokens

An access token contains the information required to allow a developer to access information on your cloud account. A developer presents the token when making API calls. The allowed actions and endpoints depend on the scopes (permissions) that you select when you generate the token. An access token is valid for about an hour.

A refresh token allows the developer to generate a new access token without having to contact an administrator. A refresh token is valid for about one year.

Process Overview

Setup steps for the Administrator:

1. Create an Identity Cloud Service client application with the specific privileges you want to grant to developers.
2. Generate an access token that contains the required privileges for the intended developer.

3. Provide the access token and required information to the developer.
4. Configure Identity Cloud Service for access token validation.

Steps for developer to use the token:

1. Issue requests against My Services API endpoints. Include the access token for the authorization parameter.
2. When the access token expires, refresh the access token without administrator intervention until the privilege is terminated.

Administrator Tasks to Set Up Token Validation

Perform the following tasks to enable developer access with an access token:

Create the IDCS client application

1. Sign in to Identity Cloud Services as an Administrator and go to the administration console. See How to Access Oracle Identity Cloud Service if you need help signing in.
2. Click the **Applications** tile. A list of the applications is displayed.
3. Click **+ Add** to create a new application.
4. Click **Trusted Application** as the type of application.
5. In the **App Details** section, enter a **Name** and **Description** and then click **Next**.
6. In the **Client** section:
    a. Select **Configure this application as a client now**.
    b. Under **Authorization**, for **Allowed grant types**, select the following options:
        - **JWT Assertion**
        - **Refresh Token**
7. Under **Accessing APIs from Other Applications**, from the **Trust Scope** list, select **Allowed scopes**.
8. Under **Allowed Scopes** click **+ Add**.

9. In the **Add Scope** dialog, click the arrow next to **CloudPortalResourceApp** in the list of App.
10. Select the box next to each authorization that you might want to give the developers to whom you will provide an Access Token. (The permissions are assigned in another step.)
11. Click **Add** to close the dialog. Your selections are displayed.
12. Click **Next**.
13. In the **Resources** section, accept the default and click **Next**.
14. In the **Web Tier Policy** section, accept the default and click **Next**.
15. In the **Authorization** section, click **Finish**.
    The **Application Added** notification displays the new Client ID and Client Secret for the application.

> **Important**
>
> Copy and store the Client ID and Client Secret in a safe place and then click **Close**. The Client ID and Client Secret are credentials that are specific to the application that you just created. You will need these credentials later.

16. To complete the creation process, click **Activate** at the top of the page.

Generate an access token

1. Navigate to the IDCS application that you created in the preceding task and select the **Details** tab.
2. Click **Generate Access Token**.
3. On the **Generate Token** dialog, select **Customized Scopes**, then select **Invokes**

Other APIs.

4. Select the scopes that you want to give to the developer who will receive this access token.

Note

Oracle recommends that you provide only the minimum required privileges.

5. Select **Include Refresh Token**.
6. Click **Download Token**. Your browser will prompt you to download a token file (.tok). The token file contains an access token and a refresh token.
7. Provide this file to the developer.

Send the access information to a developer

To call API endpoints, the developer needs:

- A token file that you generated.
- The Client ID and Client Secret for the IDCS application used to generate the token file. The Client ID and Secret are required for the developer to generate a new access token from the refresh token.
- The endpoints for the APIs.
    - End points related to the itas:myservices scopes are: `https://itra.oraclecloud.com/itas/<tenant-IDCS-ID>/myservices/api/v1`
    - End points related to the itas:metering scopes are: `https://itra.oraclecloud.com/metering/api/v1`

Make sure that you send the above information in a secure way. If you think that this information has been compromised, see Revoking a Developer's Ability to Refresh Access Tokens.

Configure Identity Cloud Service for access token validation

To allow clients to access the tenant signing certificate without logging in to Oracle Identity Cloud Service:

1. Sign in to the Oracle Identity Cloud Services admin console. See How to Access Oracle Identity Cloud Service if you need help signing in.
2. Open the navigation menu. Under **Settings** select **Default Settings**.
3. Set the **Access Signing Certificate** toggle button to on.

Using the Access Token

The token file has a .tok extension. The file contains the access token and the refresh token. The content looks like:

```
{"app_access_token":"eyJ4N...aabb...CpNwA","refresh_token":"AQID...9NCA="}
```

To use the token with the My Services API:

1. Open the token file.
2. Issue a request to a valid endpoint, inserting the access token for the `Authorization` parameter.
   For example:

   ```
   curl -X GET  https://itra.oraclecloud.com/itas/<tenant-IDCS-ID>/myservices/api/v1/serviceEntitlements   -H 'Authorization: Bearer eyJ4N...aabb...CpNwA'
   ```

Requesting a New Access Token from a Refresh Token

An access token is valid for about one hour. When the token is no longer valid you will get a 401 response code and an Error Message ("errorMessage") value containing "Expired".

You can generate a new short-lived access token from the refresh token. You'll need the Client ID and Client Secret to generate the new token. You can only generate tokens with the same or lower access (scopes) as your original token.

Example using the curl command:

```
curl -i -H 'Authorization: Basic <base64Encoded clientid:secret>' -H 'Content-Type: application/x-www-form-urlencoded;charset=UTF-8' --request POST https://<tenant-IDCS-ID>/oauth2/v1/token -d 'grant_type=refresh_token&refresh_token=<refresh-token>'
```

Using the sample token file from the previous section, the value for *<refresh-token>* would be `AQID...9NCA=`.

Sample response:

```
{ "access_token": "eyJraWQiO....2nqA", "token_type": "Bearer", "expires_in": 3600, "refresh_token": "AQIDBAUn…VkxNCB7djF9NCA=" }
```

Note

When a developer generates a new access token and refresh token, the previous refresh token becomes invalid.

Revoking a Developer's Ability to Refresh Access Tokens

If you need to revoke a developer's ability to refresh access tokens, you can either invalidate the existing refresh token by generating a new Client Secret for the token; or, you can temporarily revoke access by deactivating the application.

Important

Taking either of these actions will terminate or suspend the ability of all developers using the current Client Secret or application. When generating tokens for multiple developers, consider creating more than one IDCS application to isolate developers from each other.

To terminate a developer's ability to refresh their access token

1. Sign in to Identity Cloud Services as an Administrator and go to the administration console. See How to Access Oracle Identity Cloud Service if you need help signing in.
2. Click the **Applications** tile. A list of the applications is displayed.
3. Click the application used to generate the token to view its details.
4. Click **Configuration**.
5. Under **General Information**, next to **Client Secret**, click **Regenerate** to generate a new Client Secret.

To restore the ability for the developer to generate an access token from a refresh token, generate a new access token. Then provide the token along with the new Client Secret to the developer.

To temporarily suspend a developer's ability to refresh their access token

1. Sign in to Identity Cloud Services as an Administrator and go to the administration console. See How to Access Oracle Identity Cloud Service if you need help signing in.
2. Click the **Applications** tile. A list of the applications is displayed.
3. Click the application used to generate the token to view its details.
4. In the upper right corner of the page, click **Deactivate**.
5. At the prompt, click **Deactivate Application**.

To re-enable developers to use the same tokens, click **Activate**.

CHAPTER 3 Archive Storage

This chapter explains how to upload, manage, and access data using Archive Storage.

Overview of Archive Storage

Oracle Cloud Infrastructure offers two distinct storage class tiers to address the need for both performant, frequently accessed "hot" storage, and less frequently accessed "cold" storage. Storage tiers help you maximize performance where appropriate and minimize costs where possible.

- Use **Archive Storage** for data to which you seldom or rarely access, but that must be retained and preserved for long periods of time. The cost efficiency of the Archive Storage offsets the long lead time required to access the data.
- Use **Object Storage** for data to which you need fast, immediate, and frequent access. Data accessibility and performance justifies a higher price point to store data in the Object Storage. For more information, see Overview of Object Storage.

About Archive Storage

Archive Storage is ideal for storing data that is accessed infrequently and requires long retention periods. Archive Storage is more cost effective than Object Storage for preserving cold data for:

- Compliance and audit mandates
- Retroactively analyzing log data to determine usage pattern or debug problems
- Historical or infrequently accessed content repository data
- Application generated data that requires archival for future analysis or legal purposes

Unlike Object Storage, Archive Storage data retrieval is **not** instantaneous.

Using Archive Storage

Important

You interact with the data stored in the Archive Storage using the same resources and management interfaces that you use for data stored in Object Storage.

The following summarizes the Object Storage resources you use to store and manage Archive Storage data:

Buckets

Buckets are logical containers for storing objects. A bucket is associated with a single compartment that has policies that determine what actions a user can perform on a bucket and on all the objects in the bucket.

You decide which storage tier (Archive Storage or standard Object Storage) is appropriate for your data when you initially create the bucket container for your data. The storage tier is expressed as a property of the bucket. A bucket's storage tier property sets the initial storage tier of objects added to the bucket. However, objects placed in standard tier buckets can be archived automatically by Object Storage (while remaining in the standard tier bucket) if they meet the criteria of an object lifecycle policy rule in effect for the bucket.

Once set, you cannot change the storage tier property for a bucket:

- An existing Object Storage bucket cannot be downgraded to an Archive Storage bucket.
- An Archive Storage bucket cannot be upgraded to an Object Storage bucket.

In addition to the inability to change the storage tier designation of a bucket, there are other reasons why storage tier selection for buckets requires careful consideration:

- The minimum retention requirement for Archive Storage is 90 days. If you delete objects from Archive Storage before the minimum retention requirements are met, you

are charged a deletion penalty. The deletion penalty is the prorated cost of storing the data for the full 90 days.

- While Archive Storage is more cost effective than Object Storage for cold storage, understand that when you restore objects, you are returning those objects to Object Storage. You are billed for that storage service class while the objects reside in that tier.

You can use object lifecycle policy rules to automatically delete objects in an Archive Storage bucket based on the age of the object.

Important

You *cannot* use object lifecycle policy rules to automatically restore archived objects to the regular Object Storage tier. See Restoring and Downloading Objects for information on restoring objects.

See Managing Buckets for detailed instructions on creating an Archive Storage bucket.

Objects

Any type of data, regardless of content type, is stored as an object. The object is composed of the object itself and metadata about the object. Each object is stored in a bucket.

You upload objects to an Archive Storage bucket the same way you upload objects to a standard Object Storage bucket. The difference is that when you upload an object to an Archive Storage bucket, the object is immediately archived. You must first restore the object before you can download it.

Archived objects are displayed in the object listing of a bucket. You can also display the details of each object.

See Managing Objects for detailed instructions on uploading objects to an Archive Storage bucket.

Restoring and Downloading Objects

To download an object from Archive Storage, you must first restore the object. Restoration takes about four hours from the time an Archive Storage restore request is made, to the time the first byte of data is retrieved. The retrieval time metric is measured by Time To First Byte (TTFB). How long the full restoration takes, depends on the size of the object. You can determine the status of the restoration by looking at the object **Details**. Once the status shows as **Restored**, you can then download the object.

After an object is restored, you have a window of time to download the object. By default, you have 24 hours to download an object, but you can alternatively specify a time from 1 to 240 hours. You can find out how much of the download time is remaining by looking at **Available for Download** in object **Details**. After the allotted download time expires, the object returns to Archive Storage. You always have access to the metadata for an object, regardless of whether the object is in an archived or restored state.

See Managing Objects for detailed instructions on restoring, checking status of, and downloading Archive Storage objects.

Ways to Access Archive Storage

Archive Storage and Object Storage share the *same* management interfaces:

- The Console is an easy-to-use, browser-based interface. To access Archive Storage in the console, do the following:
  - Sign in to the Console.
  - Open the navigation menu. Under **Core Infrastructure**, click **Object Storage**. A list of the buckets in the compartment you're viewing is displayed. If you don’t see the one you're looking for, verify that you’re viewing the correct compartment (select from the list on the left side of the page).
  - Click the name of the Archive Storage tier bucket you want to manage.
- The command line interface (CLI) provides both quick access and full functionality without the need for programming. For more information, see Command Line Interface (CLI).

The syntax for the CLI commands include specifying a service. You will use the Object Storage service designation: `oci os` to manage Archive Storage using the CLI.

- The REST API provides the most functionality, but requires programming expertise. API Reference and Endpoints provides endpoint details and links to the available API reference documents. For general information about using the API, see REST APIs.
- The Oracle Cloud Infrastructure SDKs offer tools to interact with Object Storage and Archive Storage without having to create a framework. For general information about using the SDKs, see Software Development Kits and Command Line Interface.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

For administrators: Users that need to restore archived objects require the OBJECT_RESTORE permission. See Details for Object Storage, Archive Storage, and Data Transfer for more information.

WORM Compliance

You can achieve WORM compliance with Archive Storage by applying IAM policy permissions so that data once written, cannot be overwritten.

For administrators: There is not a direct way to disallow OBJECT_OVERWRITE. To achieve WORM compliance, you must specifically grant groups OBJECT_CREATE, OBJECT_READ, and OBJECT_INSPECT permissions to keep the data from being overwritten. For example, you can allow groups to inspect objects using a policy like the following:

```
Allow group <group_name> to inspect in compartment <compartment_name>
```

See for more information. If you are new to policies, see Getting Started with Policies and Common Policies.

Limits on Archive Storage Resources

See Service Limits for a list of applicable limits and instructions for requesting a limit increase.

Additional limits include:

- Number of namespaces per root compartment: 1
- Maximum size of object metadata: 2 K

CHAPTER 4 Audit

This chapter explains how to work with audit logs.

Overview of Audit

The Oracle Cloud Infrastructure Audit service automatically records calls to all supported Oracle Cloud Infrastructure public application programming interface (API) endpoints as log events. Currently, all services support logging by Audit. Object Storage service supports logging for bucket-related events, but not for object-related events. Log events recorded by the Audit service include API calls made by the Oracle Cloud Infrastructure Console, Command Line Interface (CLI), Software Development Kits (SDK), your own custom clients, or other Oracle Cloud Infrastructure services. Information in the logs shows what time API activity occurred, the source of the activity, the target of the activity, what the action was, and what the response was.

Each log event includes a header ID, target resources, time stamp of the recorded event, request parameters, and response parameters. You can view events logged by the Audit service by using the Console, API, or the SDK for Java. You can view events, copy the details of individual events, as well as analyze events or store them separately. Data from events can be used to perform diagnostics, track resource usage, monitor compliance, and collect security-related events.

Ways to Access Oracle Cloud Infrastructure

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see Software Development Kits and Command Line Interface.

To access the Console, you must use a supported browser. Oracle Cloud Infrastructure supports the latest desktop versions of Google Chrome, Microsoft Edge, Internet Explorer 11, Safari, Firefox, and Firefox ESR. Note that private browsing mode is not supported for Firefox, Internet Explorer, or Edge. Mobile browsers are not supported.

For general information about using the API, see REST APIs.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Administrators: For an example of policy that gives groups access to audit logs, see Required IAM Policy. To modify the Audit log retention period, you must be a member of the Administrators group. See The Administrators Group and Policy.

Contents of an Audit Log Event

The following explains the contents of a log event. The table does not include request headers that are specific to an Internet browser or other client.

Property	Description
compartmentId	The Oracle Cloud Identifier (OCID) of the compartment.
credentialId	The credential ID of the user. This value is extracted from the HTTP 'Authorization' request header. It consists of the tenantId, userId, and user fingerprint, all delimited by a slash (/).
compartmentName	The name of the compartment. This value is the friendly name associated with compartmentId. This value can change, but Audit logs the value that appeared at the time of the audit event.
eventId	The global unique identifier (GUID) of the event.
eventName	The name of the event.  **Note** Not all services support this property. A null value may appear when not supported by the related service.
eventSource	The source of the event.
eventTime	The time the event occurred, expressed in RFC 3339 timestamp format.
eventType	The type of the event. (Currently, Audit supports only API activities.)

Property	Description
`id`	The OCID of the resource. Found in `responsePayload` along with the name of the resource (`resourceName`). Some API operations generate an audit event, but don't involve a resource, so then the audit event does not have an `id`.
`principalId`	The OCID of the user or service that triggered the event. Find the friendly name of the service or user for this OCID in `userName`.
`requestAction`	The HTTP method of the request.
`requestAgent`	The user agent of the client that made the request.
`requestHeaders`	The HTTP header fields and values in the request.
`requestId`	The opc-request-id of the request. An opc-request-id is a unique Oracle-assigned identifier for the request. If you need to contact Oracle about a particular request, please provide the request ID.
`requestOrigin`	The IP address of the source of the request.
`requestParameters`	The query parameter fields and values for the request.
`responsePayload`	Metadata of interest from the response payload. For example, the OCID of a resource (`id`) and the name of the resource (`resourceName`). Some API operations generate an audit event, but don't involve a resource, so then `responsePayload` is empty.
`requestResource`	The resource targeted by the request.

Property	Description
`resourceName`	The name of the resource. Found in `responsePayload` along with the OCID of the resource (`id`). Some API operations generate an audit event, but don't involve a resource, so then the audit event does not have a `resourceName`.
`responseHeaders`	The headers of the response.
`responseStatus`	The status code of the response.
`responseTime`	The time of the response to the audited request, expressed in RFC 3339 timestamp format.
`tenantId`	The OCID of the tenant.
`userName`	The name of the user or service that triggered this event. This value is the friendly name associated with `principalId`.

Resource Identifiers

Most types of Oracle Cloud Infrastructure resources have a unique, Oracle-assigned identifier called an Oracle Cloud ID (OCID). For information about the OCID format and other ways to identify your resources, see Resource Identifiers.

An Example Log Event

The following is an example log event recorded by the Audit service. Copy the event into a text file to make it easier to read.

```
{
  "requestAgent": "<Browsers, Operating systems>",
  "compartmentName": "CompartmentA",
  "credentialId": "",
```

```
  "responseTime": "2018-06-14T22:24:37.713Z",
  "eventType": "ServiceApi",
  "requestHeaders": {
     <The HTTP header fields and values from the request.>
  },
  "compartmentId": "ocid.compartment.oc1..<compartment_OCID>",
  "requestId": "example-4092-8233-
e8371f94/example1BF1CE734676108C6345FF/51FE3CACE106DD8F825508D04E91E261",
  "eventName": "LaunchInstance",
  "eventSource": "ExampleService",
  "responseStatus": "200",
  "requestParameters": {
    "compartmentId": [
      "example.compartment.region1..<compartment_OCID>"
    ],
    "availabilityDomain": [
      "Example-AD-2"
    ],
    "sortOrder": [
      "DESC"
    ],
    "limit": [
      "25"
    ],
    "sortBy": [
      "timeCreated"
    ]
  },
  "userName": "JohnSmith",
  "responsePayload":{
    "resourceName":"example-instance-name","id":"ocid1.instance.oc1.phx.<instance_OCID>
    },
  "requestAction": "GET",
  "tenantId": "example.tenancy.oc1..<tenancy_OCID>",
  "responseHeaders": {
    "Access-Control-Expose-Headers": [
      "opc-previous-page,opc-next-page,opc-client-info,ETag,opc-request-id,Location"
    ],
    "Access-Control-Allow-Origin": [
      "https://console.us-phoenix-1.oraclecloud.com"
    ],
    "Access-Control-Allow-Credentials": [
```

```
      "true"
    ],
    "Connection": [
      "close"
    ],
    "Content-Length": [
      "3"
    ],

      "example-4092-8233-EXAMPLEB863DC6CEC1BF1CE734676108C6345FF/51FE3CACE106DD8F825508D04E91E261"
    ],
    "Date": [
      "Thu, 14 Jun 2018 22:24:37 GMT"
    ],
    "Content-Type": [
      "application/json"
    ]
  },
  "principalId": "example.user.oc1..<principal_OCID>",
  "requestOrigin": "172.24.96.35",
  "eventTime": "2018-06-14T22:24:37.671Z",
  "eventId": "examplea9-f488-4842-96cb-a10f2893b369",
  "requestResource": ""/20160918/images/ocid1.image.region1..<resource_OCID>"
}
```

Viewing Audit Log Events

Audit provides records of API operations performed against supported services as a list of log events. The service logs events at both the tenant and compartment level. By default, audit logs are maintained for 90 days. You can configure audit log retention for up to 365 days.

When viewing events logged by Audit, you might be interested in specific activities that happened in the tenancy or compartment and who was responsible for the activity. You will need to know that the approximate time and date something happened and the compartment in which it happened to display a list of log events that includes the activity in question. List log events by specifying a time range on the 24-hour clock in Greenwich Mean Time (GMT), calculating the offset for your local time zone, as appropriate. New activity is appended to the existing list, usually within 15 minutes of the API call, though processing time can vary.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The following policy statement gives the specified group (Auditors) the ability to view all the Audit event logs in the tenancy:

```
Allow group Auditors to read audit-events in tenancy
```

To give the group access to the Audit event logs in a specific compartment only (Project-A), write a policy like the following:

```
Allow group Auditors to read audit-events in compartment Project-A
```

If you're new to policies, see Getting Started with Policies and Common Policies. For more details about policies for the Audit, see Details for the Audit Service.

Searching and Filtering in the Console

When you navigate to Audit in the Console, a list of results is generated for the current compartment. Audit logs are organized by compartment, so if you are looking for a particular event, you must know which compartment the event occurred in. You can filter the list in all the following ways:

- Date and time
- Request Action Types (operations)
- Keywords

For example, users begin to report that their attempts to log in are failing. You want to use Audit to research the problem. Adjust the date and time to search for corresponding failures during a window of time that starts a little before the events were reported. Look for corresponding failures and similar operations preceding the failures to correlate a reason for the failures.

Note

The service logs events at the time they are processed. There can be a delay between the time an operation occurs and when it is processed.

You can filter results by request actions to zero in on only the events with operations that interest you. For example, say that you only want to know about instances that were deleted during a specific time frame. Select a delete request action filter to see only the events with delete operations.

You can also filter by keywords. Keyword filters are powerful when combined with the values from audit event fields. For example, say that you know the user name of an account and want a list of all activity by that account in a particulate time frame. Do a search using the user name as a keyword filter.

Every audit event contains the same fields, so search for values from those fields. To get a better understanding of what values are available, see Contents of an Audit Log Event.

Using the Console

To search log events

1. Open the navigation menu. Under **Governance and Administration**, go to **Governance** and click **Audit**.
   The list of events that occurred in the current compartment is displayed.
2. Click one of the compartments under **Compartment**.
   Audit organizes logs by compartment, so if you are looking for a particular event, you must know which compartment the event occurred in.
3. Click in the **Start Date** box to choose the start date and time for the range of results you want to see. You can click the arrows on either side of the month to go backward or

forward.

4. (Optional) Specify a time by doing one of the following:
   a. Click **Time** and specify an exact start time in thirty-minute increments.
   b. Type an exact time in the **Start Date** box.
      The service uses a 24-hour clock, so you must provide a number between `0` and `23` for the hour. Also remember to calculate the offset between Greenwich Mean Time (GMT) and your local time.
5. Repeat step 3 and 4 to choose an end date and time.

Note

The age of the results available can be between 90 and 365 days, depending on your tenancy's setting for audit log retention period.

6. (Optional) In **Request Action Types**, specify one or more operations with which to filter results.
   - GET
   - POST
   - PUT
   - PATCH
   - DELETE
7. (Optional) In the **Keywords** box, type the text you want to find and click **Search**.
   Tip: If you want to find log events with a specific status code, include quotes (") around the code to avoid results that have those numbers embedded in a longer string.

The results are updated to include only log events that were processed within the time range and filters you specified. If an event occurred in the recent past, you might have to wait to see it in the list. The service typically requires up to 15 minutes for processing.

If there are more than 100 results for the specified time range, you can click the right arrow next to the page number at the bottom of the page to advance to the next page of log events.

Tip

If you get less than 100 results on the last page of a results list, you might still have more results, which you can access by clicking the right arrow. Audit will prompt you if there are more results.

If you want to view all the key-value pairs in a log event, see To view the details of a log event.

To view the details of a log event

View the details of your event:

- To see only the top-level details, click the down arrow to the right of an event.
- To see lower-level details, click **{ . . . }** to the right of the collapsed parameter.

To copy the details of a log event

The following assumes you have expanded a row in your results.

- To copy an entire event, click the clipboard icon to the right of the `event` parameter.
- To copy a portion of an event, click the clipboard icon to the right of the nested parameter or value you want to copy.

The log event is copied to your clipboard. The Audit service logs events in JSON format. You can paste the log event details into a text editor to save and review later or to use with standard log analysis tools.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operation to list audit log events:

- ListEvents

> **Note**
>
> This is a query API. Do not use this API for bulk-export operations.

Setting Audit Log Retention Period

By default, Audit logs are retained for 90 days. You can configure log retention for up to 365 days. You can edit the log retention period in the tenancy details page.

Retention period is a tenancy-level setting. The value of the retention period setting affects all regions and all compartments. You can't set different retention periods for different regions or compartments.

Required IAM Policy

To modify the Audit log retention period, you must be a member of the Administrators group. See The Administrators Group and Policy

Using the Console

To modify the Audit log retention period

1. Open the **User** menu () and click **Tenancy:** *<your_tenancy_name>*.

The tenancy details are displayed. The **Audit Retention Period** is displayed under **Tenancy Information**.

2. Click **Edit Audit Retention Policy**. Enter the number of days you want to retain the audit logs for. The minimum you can set the value to is 90 and the maximum is 365. This value is enforced for all regions and all compartments in the tenancy.
3. Click **Submit**.

Note

You won't see the new value immediately

It may take several minutes for the new setting to display in the Console.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations to manage the log retention period configuration:

- GetConfiguration
- UpdateConfiguration

Bulk Export of Audit Log Events

You can request a bulk export of audit logs, and within 3–4 business days Oracle support will begin making copies of the logs and adding them to buckets in your tenancy. The export includes logs for the specified regions, beginning after you make the request and continuing into the future.

Highlights

- Administrators have full control of the buckets and can provide access to others with IAM policy statements.
- Exported logs remain available indefinitely.

Tip

You can automatically manage archiving and deleting logs using Object Storage. See Using Object Lifecycle Management.

- Specify all the regions you want exported in your request. If you only request some regions, then decide later you want to add other regions, you must make another request.
- To disable your bulk export, contact Oracle support. New logs will stop being added to the bucket, and audit logs will only be available through the Console, based on the retention period you have defined.

Required IAM Policy

To access the bucket where Oracle exports the audit logs, you must be a member of the Administrators group. See The Administrators Group and Policy

Requesting an Export of Audit Logs

A member of the Administrators group for your tenancy must create a ticket at My Oracle Support and provide the following information:

- Ticket name: Export Audit Logs - *<your_company_name>*
- Tenancy OCID

- Regions

For example:

- Ticket name: Export Audit Logs - ACME
- Tenancy OCID: ocid1.tenancy.oc1.*<unique_ID>*
- Regions: us-ashburn-1, us-phoenix-1

Note

It can take 3–4 business days before your My Oracle Support ticket is complete and the logs are available to you.

Bucket and Object Details

This section specifies the naming conventions of the bucket and objects you receive.

Bucket Name Format

Oracle support creates buckets for audit log exports using the following naming format:

`oci-logs._audit.`*<compartment_OCID>*

- `oci-logs` identifies that Oracle created this bucket.
- `_audit` identifies that the bucket contains audit events.
- *<compartment_OCID>* identifies the compartment where the audit events were generated.

For example:

```
oci-logs._audit.ocid1compartment.oc1..<unique_ID>
```

Important

If the OCID of the compartment that generated the audit log contains a colon, your bucket name will not match the OCID. To create a bucket, Oracle must substitute colon characters (:) from the OCID with dot characters (.) in the bucket name.

Object Name Format

Objects use the following naming format:

<region>/*<ad>*/*<YYYY-MM-DDTHH:MMZ>*[_*<seqNum>*].log.gz

- *<region>* identifies the region where the audit events were generated.
- *<ad>* identifies the availability domain where the audit events were generated.
- *<YYYY-MM-DDTHH:MMZ>* specifies the start of a 10-minute window for audit events listed in the object. For example, during a thirty-minute period, Oracle would write three objects, the first would contain audit events that occurred from 00–09:59, the second object would contain events from 10–19:59, while the third object contains events for 20–29:59.
- [_*<seqNum>*] specifies a conditional sequence number. If present, this number means that either an event came in late or the object became too large to write. Sequence numbers start at two. Apply multiple sequence numbers to the original object in the order listed.

For example:

```
us-phoenix-1/ad1/2019-03-21T00:00Z.log.gz
us-phoenix-1/ad1/2019-03-21T00:00Z_2.log.gz
```

File Format

Files list a single audit event per line. For more information, see Contents of an Audit Log Event.

CHAPTER 5 Block Volume

This chapter explains how to create storage volumes and attach them to instances.

Overview of Block Volume

The Oracle Cloud Infrastructure Block Volume service lets you dynamically provision and manage block storage volumes. You can create, attach, connect, and move volumes as needed to meet your storage and application requirements. After you attach and connect a volume to an instance, you can use the volume like a regular hard drive. You can also disconnect a volume and attach it to another instance without the loss of data.

These components are required to create a volume and attach it to an instance:

- **Instance:** A bare metal or virtual machine (VM) host running in the cloud.
- **Volume attachment:** There are two types of volume attachments:
  - iSCSI**:** A TCP/IP-based standard used for communication between a volume and attached instance.
  - Paravirtualized**:** A virtualized attachment available for VMs.
- **Volume:** There are two types of volumes:
  - **Block volume:** A detachable block storage device that allows you to dynamically expand the storage capacity of an instance.
  - **Boot volume:** A detachable boot volume device that contains the image used to boot a Compute instance. See Boot Volumes for more information.

For additional Oracle Cloud Infrastructure terms, see the Glossary.

Typical Block Volume Scenarios

Scenario A: Expanding an Instance's Storage

A common usage of Block Volume is adding storage capacity to an Oracle Cloud Infrastructure instance. After you have launched an instance and set up your cloud network, you can create a block storage volume through the Console or API. Then, you attach the volume to an instance using a volume attachment. After the volume is attached, you connect to the volume from your instance's guest OS using iSCSI. The volume can then be mounted and used by your instance.

Scenario B: Persistent and Durable Storage

A Block Volume volume can be detached from an instance and moved to a different instance without the loss of data. This data persistence enables you to migrate data between instances and ensures that your data is safely stored, even when it is not connected to an instance. Any data remains intact until you reformat or delete the volume.

To move your volume to another instance, unmount the drive from the initial instance, terminate the iSCSI connection, and attach the volume to the second instance. From there, you connect and mount the drive from that instance's guest OS to have access to all of your data.

Additionally, Block Volume volumes offer a high level of data durability compared to standard, attached drives. All volumes are automatically replicated for you, helping to protect against data loss.

Scenario C: Instance Scaling

When you terminate an instance, you can keep the associated boot volume and use it to launch a new instance with a different instance type or shape. This allows you to easily switch from a bare metal instance to a VM instance and vice versa, or scale up or scale down the number of cores for an instance. See Creating an Instance for steps to launch an instance based on a boot volume.

Volume Attachment Types

When you attach a block volume to a VM instance, you have two options for attachment type, iSCSI or paravirtualized. Paravirtualized attachments simplify the process of configuring your block storage by removing the extra commands that are required before connecting to an iSCSI-attached volume. The trade-off is that IOPS performance for iSCSI attachments is greater than that for paravirtualized attachments. You should consider your requirements when selecting a volume's attachment type.

Important

Connecting to Volumes on Linux Instances

When connecting to volumes on Linux instances, if you want to automatically mount these volumes on instance boot, you need to use some specific options in the `/etc/fstab` file, or the instance may fail to launch. See Traditional fstab Options and fstab Options for Block Volumes Using Consistent Device Paths for more information.

iSCSI

iSCSI attachments are the only option when connecting a block volume to any of the following types of instances:

- Bare metal instances
- VM instances based on Windows images that were published before February 2018
- VM instances based on Linux images that were published before December 2017

After the volume is attached, you need to log in to the instance and use the `iscsiadm` command-line tool to configure the iSCSI connection. For more information about the additional configuration steps required for iSCSI attachments, see iSCSI Commands and Information, Connecting to a Volume, and Disconnecting From a Volume.

IOPS performance is better with iSCSI attachments compared to paravirtualized attachments. For more information about iSCSI-attached volume performance, see Block Volume Performance.

Paravirtualized

Paravirtualized attachments are an option when attaching volumes to the following types of VM instances:

- For VM instances launched from Oracle-provided images, you can select this option for Linux-based images published in December 2017 or later, and Windows images published in February 2018 or later.
- For VM instances launched from custom images, the volume attachment type is based on the volume attachment type from the VM the custom image was created from.

After you attach a volume using the paravirtualized attachment type, it is ready to use, and you do not need to run any additional commands. However, because of the overhead of virtualization, this reduces the maximum IOPS performance for larger block volumes. See Paravirtualized Attachment Performance for more information.

Volume Access Types

When you attach a block volume, you can specify one of the following options for access type:

- **Read/write:** This is the default option for volume attachments. With this option, an instance can read and write data to the volume.
- **Read-only:** With this option, an instance can only read data on the volume. It cannot update data on the volume. Specify this option to safeguard data against accidental or malicious modifications.

To change the access type for a block volume, you need to detach the volume and specify the new access type when you reattach the volume. For more information, see Detaching a Volume and Attaching a Volume.

The access type for boot volumes is always read/write. If you want to change the access type, you need to stop the instance and detach the boot volume. You can then reattach it to another

instance as a block volume, with read-only specified as the access type. For more information, see Detaching a Boot Volume and Attaching a Volume.

Device Paths

When you attach a block volume to a compatible Linux-based instance, you can select a device path that remains consistent between instance reboots. This enables you to refer to the volume using a consistent device path. For example, you can use the device path when you set options in the `/etc/fstab` file to automatically mount the volume on instance boot.

Consistent device paths are supported on instances when all of the following things are true:

- The instance was created using an Oracle-provided image.
- The image is a Linux-based image.
- The image was released in November 2018 or later. For specific version numbers, see Oracle-Provided Image Release Notes.
- The instance was launched after January 11, 2019.

For instances launched using the image OCID or an existing boot volume, if the source image supports consistent device paths, the instance supports device paths.

Consistent device paths are not supported on Linux-based partner images or custom images that are created from other sources. This feature does not apply to Windows-based images.

Important

You must select a device path when you attach a volume using the Console, it is required. Specifying a device path is optional when you attach a volume using the CLI, REST APIs, or SDK.

For more information about consistent device paths, see Connecting to Volumes With Consistent Device Paths.

Regions and Availability Domains

Volumes are only accessible to instances in the same availability domain . You cannot move a volume between availability domains or regions.

For more information, see Regions and Availability Domains.

Resource Identifiers

Most types of Oracle Cloud Infrastructure resources have a unique, Oracle-assigned identifier called an Oracle Cloud ID (OCID). For information about the OCID format and other ways to identify your resources, see Resource Identifiers.

Ways to Access Oracle Cloud Infrastructure

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see Software Development Kits and Command Line Interface.

To access the Console, you must use a supported browser. Oracle Cloud Infrastructure supports the latest desktop versions of Google Chrome, Microsoft Edge, Internet Explorer 11, Safari, Firefox, and Firefox ESR. Note that private browsing mode is not supported for Firefox, Internet Explorer, or Edge. Mobile browsers are not supported.

For general information about using the API, see REST APIs.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see

Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Monitoring Resources

You can monitor the health, capacity, and performance of your Oracle Cloud Infrastructure resources by using metrics, alarms, and notifications. For more information, see Monitoring Overview and Notifications Overview.

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Block Volume Encryption

The Oracle Cloud Infrastructure Block Volume service always encrypts all block volumes, boot volumes, and volume backups at rest by using the Advanced Encryption Standard (AES) algorithm with 256-bit encryption. By default all volumes and their backups are encrypted using the Oracle-provided encryption keys. You have the option to encrypt all of your volumes and their backups using the keys that you own and manage using the Key Management service, for more information see Overview of Key Management. If you do not configure a volume to use the Key Management service or you later unassign a key from the volume, the Block Volume service uses the Oracle-provided encryption key instead. This applies to both encryption at-rest and in-transit encryption.

For how to use your own key for new volumes, see Creating a Volume. See To assign a key to an existing Block Volume for how to assign or change the key for an existing volume.

All the data moving between the instance and the block volume is transferred over an internal and highly secure network. If you have specific compliance requirements related to the encryption of the data while it is moving between the instance and the block volume, the Block Volume service provides the option to enable in-transit encryption for paravirtualized volume attachments on virtual machine (VM) instances.

Important

In-transit encryption for boot and block volumes is only available for virtual machine (VM) instances launched from Oracle-provided images, it is not supported on bare metal instances. It is also not supported in most cases for instances launched from custom images imported for "bring your own image" (BYOI) scenarios. To confirm support for certain Linux-based custom images and for more information contact Oracle support, see Contacting Support.

Block Volume Data Eradication

The Oracle Cloud Infrastructure Block Volume service uses eventual-overwrite data eradication, which guarantees that block volumes you delete cannot be accessed by anyone else and that the deleted data is eventually overwritten. When you terminate a volume, its associated data is overwritten in the storage infrastructure before any future volume allocations.

Block Volume Capabilities and Limits

Block Volume volumes can be created in sizes ranging from **50 GB** to **32 TB** in **1 GB** increments. By default, Block Volume volumes are **1 TB**.

Block Volume volume performance varies with volume size.

See Service Limits for a list of applicable limits and instructions for requesting a limit increase.

Additional limits include:

- **Volumes per instance:** 32
- **Number of backups**
  - Monthly universal credits: 1000
  - Pay-as-you-go: 500

iSCSI Commands and Information

Block volumes attached with the iSCSI attachment type use the iSCSI protocol to connect a volume to an instance. See Volume Attachment Types for more information about volume attachment options.

Once the volume is attached, you need to log on to the instance and use the `iscsiadm` command-line tool to configure the iSCSI connection. After you configure the volume, you can mount it and use it like a normal hard drive.

To enhance security, Oracle enforces an iSCSI security protocol called CHAP that provides authentication between the instance and volume.

Accessing a Volume's iSCSI Information

When you successfully attach a volume to an instance, Block Volume provides a list of iSCSI information. You need the following information from the list when you connect the instance to the volume.

- IP address
- Port
- CHAP user name and password (if enabled)
- IQN

Note

The CHAP credentials are auto-generated by the system and cannot be changed. They are also unique to their assigned volume/instance pair and cannot be used to authenticated another volume/instance pair.

The Console provides this information on the details page of the volume's attached instance. Click the Actions icon (three dots) on your volume's row, and then click **iSCSI Information**. The system also returns this information when the `AttachVolume` API operation completes successfully. You can re-run the operation with the same parameter values to review the information.

See Attaching a Volume and Connecting to a Volume for step-by-step instructions.

Additional Reading

There is a wealth of information on the internet about iSCSI and CHAP. If you need more information on these topics, try the following pages:

- Oracle Linux Administrator's Guide for Release 7 - About iSCSI Storage
- Oracle Linux Administrator's Guide for Release 6 - About iSCSI Storage
- Troubleshooting iSCSI Configuration Problems

Volume Groups

The Oracle Cloud Infrastructure Block Volume service provides you with the capability to group together multiple volumes in a volume group. A volume group can include both types of volumes, boot volumes, which are the system disks for your Compute instances, and block volumes for your data storage. You can use volume groups to create volume group backups and clones that are point-in-time and crash-consistent.

This simplifies the process to create time-consistent backups of running enterprise applications that span multiple storage volumes across multiple instances. You can then restore an entire group of volumes from a volume group backup.

Similarly, you can also clone an entire volume group in a time-consistent and crash-consistent manner. A deep disk-to-disk and fully isolated clone of a volume group, with all the volumes associated in it, becomes available for use within a matter of seconds. This speeds up the process of creating new environments for development, quality assurance, user acceptance testing, and troubleshooting.

For more information about Block Volume-backed system disks, see Boot Volumes. For more information about Block Volume backups see Overview of Block Volume Backups. See Cloning a Volume for more information about Block Volume clones.

This capability is available using the Console, command line interface (CLI), SDKs, or REST APIs.

Volume groups and volume group backups are high-level constructs that allow you to group together multiple volumes. When working with volume groups and volume group backups, keep the following in mind:

- You can only add a volume to a volume group when the volume status is available.
- You can add up to 32 volumes in a volume group, up to a maximum size limit of 128 TB. For example, if you wanted to add 32 volumes of equal size to a volume group, the maximum size for each volume would be 4 TB. Or you could add volumes that vary in size, however the overall combined size of all the block and boot volumes in the volume group must be 128 TB or less. Make sure you account for the size of any boot volumes in your volume group when considering volume group size limits.
- Each volume may only be in one volume group.
- When you clone a volume group, a new group with new volumes are created. For example, if you clone a volume group containing three volumes, once this operation is complete, you will now have two separate volume groups and six different volumes with nothing shared between the volume groups.
- When you update a volume group using the CLI, SDKs, or REST APIs you need to specify all the volumes to include in the volume group each time you use the update operation.

If you do not include a volume ID in the update call, that volume will be removed from the volume group.

- When you delete a volume group the individual volumes in the group are not deleted, only the volume group is deleted.
- When you delete a volume that is part of a volume group you must first remove it from the volume group before you can delete it.
- When you delete a volume group backup, all the volume backups in the volume group backup are deleted.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes, backups, and volume groups.

See the following policy examples for working with volume groups:

- Let users create a volume group lets the specified group create a volume group from a set of volumes.
- Let users clone a volume group lets the specified group clone a volume group from an existing volume group.
- Let users create a volume group backup lets the specified group create a volume group backup.
- Let users restore a volume group backup lets the specified group create a volume group by restoring a volume group backup.

Tip

When users create a backup from a volume or restore a volume from a backup, the volume and backup don't have to be in the same compartment. However, users must have access to both compartments.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Using the Console

To create a volume group from existing volumes

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Volumes Groups**.
2. Click **Create Volume Group**.
3. Fill in the required volume information:
    - **Name**: A user-friendly name or description.
    - **Compartment**: The compartment for the volume group.
    - **Availability Domain**: The availability domain for the volume group.

- **Volumes**: For each volume you want to add, select the compartment containing the volume and then the volume to add. Click **+ Volume** to add additional volumes.

4. Click **Create Volume Group**.

To view the volumes in a volume group

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Volumes Groups**.
2. In the **Volume Groups** list, click the volume group you want to view the volumes for.
3. To view the block volumes for the volume group, in **Resources**, click **Block Volumes**.
4. To view the boot volumes for the volume group, in **Resources**, click **Boot Volumes**.

To add block volumes to an existing volume group

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Volumes Groups**.
2. In the **Volume Groups** list, click the volume group you want to add the volume to.
3. In **Resources**, click **Block Volumes**.
4. Click **Add Block Volumes**.
5. For each block volume you want to add, select the compartment containing the volume and then select the volume to add. Click **+ Volume** to add additional volumes.
6. Once you have selected all the block volumes to add to the volume group, click **Add**.

To remove block volumes from an existing volume group

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Volumes Groups**.
2. In the **Volume Groups** list, click the volume group you want to add the volume to.

3. In **Resources**, click **Block Volumes**.
4. In **Actions** menu for the block volume you want to remove, click **Remove**.
5. In the **Confirm** dialog, click **Remove**.

To add boot volumes to an existing volume group

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Volumes Groups**.
2. In the **Volume Groups** list, click the volume group you want to add the volume to.
3. In **Resources**, click **Boot Volumes**.
4. Click **Add Boot Volumes**.
5. For each boot volume you want to add, select the compartment containing the volume and then select the volume to add. Click **+ Volume** to add additional volumes.
6. Once you have selected all the boot volumes to add to the volume group, click **Add**.

To remove boot volumes from an existing volume group

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Volumes Groups**.
2. In the **Volume Groups** list, click the volume group you want to add the volume to.
3. In **Resources**, click **Boot Volumes**.
4. In **Actions** menu for the boot volume you want to remove, click **Remove**.
5. In the **Confirm** dialog, click **Remove**.

To create a backup of the volume group

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Volumes Groups**.

2. In the **Volume Groups** list, click **Create Volume Group Backup** in the **Actions** menu for the volume group you want to create a backup for.

To create a clone of the volume group

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Volumes Groups**.
2. In the **Volume Groups** list, click **Create Volume Group Clone** in the **Actions** menu for the volume group you want to clone.

To delete the volume group

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Volumes Groups**.
2. In the **Volume Groups** list, click the volume group you want to delete.
3. On the **Volume Group Details** page, click **Terminate**.
4. On the **Terminate Volume Group** dialog, click **Terminate**.

Note

When you delete a volume group the individual volumes in the group are not deleted, only the volume group is deleted.

To restore a volume group from a volume group backup

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Volumes Group Backups**.

2. In the **Volume Group Backups** list, click the volume group backup you want to restore.
3. Click **Create Volume Group**.
4. Fill in the required volume information:
   - **Name**: A user-friendly name or description.
   - **Compartment**: The compartment for the volume group.
   - **Availability Domain**: The availability domain for the volume group.
5. Click **Create Volume Group**.

Using the CLI

For information about using the CLI, see Command Line Interface (CLI).

To retrieve information about the supported operations

Open a command prompt and run the one of the following commands to retrieve the information.

- To retrieve the supported operations for volume groups:

```
oci bv volume-group --help
```

- To retrieve the supported operations for volume group backups:

```
oci bv volume-group-backup --help
```

- To retrieve help for a specific volume group operation:

```
oci bv volume-group <operation_name> --help
```

- To retrieve help for a specific volume group backup operation:

```
oci bv volume-group-backup <operation_name> --help
```

Volume Group Operations

To list the volume groups in a specified compartment

Open a command prompt and run:

```
oci bv volume-group list --compartment-id <compartment_ID>
```

For example:

```
oci bv volume-group list --compartment-id ocid1.compartment.oc1..<unique_ID>
```

To create a volume group from existing volumes

Open a command prompt and run:

```
oci bv volume-group create --compartment-id <compartment_ID> --availability-domain <external_AD> --
source-details <Source_details_JSON>
```

Volume status must be available to add it to a volume group.

For example:

```
oci bv volume-group create --compartment-id ocid1.compartment.oc1..<unique_ID> --availability-domain
ABbv:PHX-AD-1 --source-details '{"type": "volumeIds", "volumeIds":["ocid1.volume.oc1.phx.<unique_ID_1>",
"ocid1.volume.oc1.phx.<unique_ID_2>"]}'
```

To clone a volume group from another volume group

Open a command prompt and run:

```
oci bv volume-group create --compartment-id <compartment_ID> --availability-domain <external_AD> --
source-details <Source_details_JSON>
```

For example:

```
oci bv volume-group create --compartment-id ocid1.compartment.oc1..<unique_ID> --availability-domain
ABbv:PHX-AD-1 --source-details '{"type": "volumeGroupId", "volumeGroupId":
"ocid1.volumegroup.oc1.phx.<unique_ID>"}'
```

To restore a volume group from a volume group backup

Open a command prompt and run:

```
oci bv volume-group create --compartment-id <compartment_ID> --availability-domain <external_AD> --
source-details <Source_details_JSON>
```

For example:

```
oci bv volume-group create --compartment-id ocid1.compartment.oc1..<unique_ID> --availability-domain
ABbv:PHX-AD-1 --source-details '{"type": "volumeGroupBackupId", "volumeGroupBackupId":
"ocid1.volumegroup.oc1.sea.<unique_ID>"}'
```

To retrieve a volume group

Open a command prompt and run:

```
oci bv volume-group get --volume-group-id <volume-group-ID>
```

For example:

```
oci bv volume-group get --volume-group-id ocid1.volumegroup.oc1.phx.<unique_ID>
```

To update display name or add/remove volumes from a volume group

Open a command prompt and run:

```
oci bv volume-group update --volume-group-id <volume-group_ID> --volume-ids <volume_ID_JSON>
```

You can update the volume group display name along with adding or removing volumes from the volume group. The volume group is updated to include only the volumes specified in the update operation. This means that you need to specify the volume IDs for all of the volumes in the volume group each time you update the volume group.

The following example changes the volume group's display name for a volume group with two volumes:

```
oci bv volume-group update --volume-group-id ocid1.volumegroup.oc1.phx.<unique_ID> --volume-ids '
["ocid1.volume.oc1.phx.<unique_ID_1>","ocid1.volume.oc1.phx.<unique_ID_2>"]' --display-name "new display
name"
```

If you specify volumes in the command that are not part of the volume group they are added to the group. Any volumes not specified in the command are removed from the volume group.

To delete a volume group

Open a command prompt and run:

```
oci bv volume-group delete --volume-group-id <volume-group_ID>
```

When you delete a volume group, the individual volumes in the group are not deleted, only the volume group is deleted.

For example:

```
oci bv volume-group delete --volume-group-id ocid1.volumegroup.oc1.phx.<unique_ID>
```

Volume Group Backup Operations

To list volume backup groups

Open a command prompt and run:

```
oci bv volume-group-backup list --compartment-id <compartment_ID>
```

For example:

```
oci bv volume-group-backup list --compartment-id ocid1.compartment.oc1..<unique_ID>
```

To create a volume group backup

Open a command prompt and run:

```
oci bv volume-group-backup create --volume-group-id <volume-group_ID>
```

For example:

```
oci bv volume-group-backup create --volume-group-id ocid1.volumegroup.oc1.phx.<unique_ID>
```

To retrieve a volume group backup

Open a command prompt and run:

```
oci bv volume-group-backup get --volume-group-backup-id <volume-group-backup_ID>
```

For example:

```
oci bv volume-group-backup get --volume-group-backup-id ocid1.volumegroupbackup.oc1.phx.<unique_ID>
```

To update display name for a volume group backup

Open a command prompt and run:

```
oci bv volume-group-backup update --volume-group-backup-id <volume-group-backup_ID> --display-name <new_display_name>
```

You can only update the display name for the volume group backup.

For example:

```
oci bv volume-group-backup update --volume-group-backup-id ocid1.volumegroupbackup.oc1.phx.<unique_ID> --display-name "new display name"
```

To delete a volume group backup

Open a command prompt and run:

```
oci bv volume-group-backup delete --volume-group-backup-id <volume-group-backup_ID>
```

When you delete a volume group backup, all volume backups in the group are deleted.

For example:

```
oci bv volume-group-backup delete --volume-group-backup-id ocid1.volumegroupbackup.oc1.phx.<unique_ID>
```

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations for working with volume groups:

- ListVolumeGroups
- CreateVolumeGroup
- DeleteVolumeGroup
- GetVolumeGroup
- UpdateVolumeGroup

Use the following operations for working with volume group backups:

- ListVolumeGroupBackups
- CreateVolumeGroupBackup
- DeleteVolumeGroupBackup
- GetVolumeGroupBackup
- UpdateVolumeGroupBackup

Creating a Volume

You can create a volume using Block Volume.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Monitoring Resources

You can monitor the health, capacity, and performance of your Oracle Cloud Infrastructure resources by using metrics, alarms, and notifications. For more information, see Monitoring Overview and Notifications Overview.

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Block Volumes**.
2. Click **Create Block Volume**.
3. Fill in the required volume information:
    - **Name**: A user-friendly name or description.
    - **Domain**: Must be in the same **availability domain** as the instance.
    - **Size**: Must be between **50 GB** and **32 TB**. You can choose in 1 GB increments within this range. The default is 1024 GB. If you choose a size outside of your service limit, you may be prompted to request an increase. For more information, see Service Limits.
    - **Backup Policy**: Optionally, you can select the appropriate backup policy for your requirements. See Policy-Based Backups for more information about backup policies.
    - **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you

should apply tags, skip this option (you can apply tags later) or ask your administrator.

- **Encryption:** Optionally, you can encrypt the data in this volume using your own Key Management encryption key. To use Key Management for your encryption needs, select the **Encrypt using Key Management** check box. Then, select the **Vault Compartment** and **Vault** that contain the master encryption key you want to use. Also select the **Master Encryption Key Compartment** and **Master Encryption Key**. For more information about encryption, see Overview of Key Management.

4. Click **Create Block Volume**.
   The volume will be ready to attach once its icon no longer lists it as **PROVISIONING** in the volume list. For more information, see Attaching a Volume.

Using the API

To create a volume, use the following operation:

- CreateVolume

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Attaching a Volume

You can attach a volume to an instance in order to expand the available storage on the instance. If you specify iSCSI as the volume attachment type, you must also connect and mount the volume from the instance for the volume to be usable. For more information, see Volume Attachment Types and Connecting to a Volume.

Note

You should only attach Linux volumes to Linux instances and Windows volumes to Windows instances.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to attach/detach existing block volumes. The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups, but not launch instances.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. In the **Instances** list, click the instance that you want to attach a volume to.
3. In the **Resources** section, click **Attached Block Volumes**.
4. Click **Attach Block Volume**.
5. Select the volume attachment type, **iSCSI** or **Paravirtualized**.
   For more information, see Volume Attachment Types.

6. In the **Block Volume Compartment** drop-down list, select the compartment.
7. Specify the volume you want to attach to. To use the volume name, choose **SELECT VOLUME** and then select the volume from the **Block Volume** drop-down list. To specify the volume OCID, choose **ENTER VOLUME OCID** and then enter the OCID into the **Block Volume OCID** field.
8. If the instance supports consistent device paths, and the volume you are attaching is not a boot volume, select a path from the **Device Path** drop-down list when attaching. This is required and enables you to specify a device path for the volume attachment that remains consistent between instance reboots.

   For more information about this feature and the instances that support it, see Connecting to Volumes With Consistent Device Paths

   Tip

   You must select a device path when you attach a volume from the Console, it is not optional. Specifying a device path is optional when you attach a volume using the CLI, REST APIs, or SDK.
9. Select the access type, **Read/Write** or **Read-only**.

   For more information, see Volume Access Types.
10. For paravirtualized volume attachments on virtual machine (VM) instances, you can optionally encrypt data that is transferred between the instance and the Block Volume service storage servers. To do this, select the **Use in-transit encryption** check box. If you configured the volume to use an encryption key that you manage using the Key Management service, this key is used for in-transit encryption. Otherwise, the Oracle-provided encryption key is used. See Block Volume Encryption for more information.
11. Click **Attach**.

    When the volume's icon no longer lists it as **Attaching**, if the attachment type is Paravirtualized, you can use the volume. If the attachment type is iSCSI, you need to connect to the volume first. For more information, see Connecting to a Volume.

On Linux-based instances, if you want to automatically mount volumes on instance boot, you need to set some specific options in the `/etc/fstab` file, or the instance may fail to launch. This applies to both iSCSI and paravirtualized attachment types. For volumes using consistent device paths, see fstab Options for Block Volumes Using Consistent Device Paths. For all other volumes, see Traditional fstab Options.

Using the API

To attach a volume to an instance, use the following operation:

- AttachVolume

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Connecting to Volumes With Consistent Device Paths

Oracle Cloud Infrastructure supports consistent device paths for block volumes that are attached to compatible Linux-based instances. When you attach a block volume to an instance, you must select a device path that remains consistent between instance reboots. This enables you to use a consistent device path when you refer to the volume to perform tasks such as:

- Creating partitions.
- Creating file systems.
- Mounting file systems.
- Specifying options in the `/etc/fstab` file to ensure that volumes are mounted properly when automatically mounting volumes on instance boot. For more information, see fstab Options for Block Volumes Using Consistent Device Paths.

When you use consistent device paths on compatible Linux-based instances, the boot volume's device path is:

```
/dev/oracleoci/oraclevda
```

Note

Device paths are not available when you attach a boot volume as a data volume to a second instance.

Images that Support Consistent Device Paths

Consistent device paths are supported on instances when all of the following things are true:

- The instance was created using an Oracle-provided image.
- The image is a Linux-based image.
- The image was released in November 2018 or later. For specific version numbers, see Oracle-Provided Image Release Notes.
- The instance was launched after January 11, 2019.

For instances launched using the image OCID or an existing boot volume, if the source image supports consistent device paths, the instance supports device paths.

Consistent device paths are not supported on Linux-based partner images or custom images that are created from other sources. This feature does not apply to Windows-based images.

Important

You must select a device path when you attach a volume using the Console, it is required. Specifying a device path is optional when you attach a volume using the CLI, REST APIs, or SDK.

Device Paths in the Console

You select a device path when you attach a block volume to an instance.

If you specify a device path, the path appears in the **Attached Block Volumes** list for an instance, in the **Device Path** field. An example is shown in the following screenshot.

Device Paths on the Instance

Use the following sample commands to perform various configuration tasks on the attached volume. Commands are provided for volumes that use consistent device paths and for volumes that don't.

Creating a partition with `fdisk`

- **No device path specified:**

```
fdisk /dev/sdb
```

- **Device path specified:**

```
fdisk /dev/oracleoci/oraclevdb
```

Creating an ext3 file system

- **No device path specified:**

```
/sbin/mkfs.ext3 /dev/sdb1
```

- **Device path specified:**

```
/sbin/mkfs.ext3 /dev/oracleoci/oraclevdb1
```

Updating the `/etc/fstab` file

- **No device path specified:**

```
UUID=84dc162c-43dc-429c-9ac1-b511f3f0e23c /oradiskvdb1 xfs defaults,_netdev,noatime 0 2
```

- **Device path specified:**

```
/dev/oracleoci/oraclevdb1   /oradiskvdb1    ext3    defaults,_netdev,noatime  0  2
```

Mounting the file system

- **No device path specified:**

```
mount /dev/sdb1 /oradiskvdb1
```

- **Device path specified:**

```
mount /dev/oracleoci/oraclevdb1 /oradiskvdb1
```

Connecting to a Volume

For volumes attached with Paravirtualized as the volume attachment type, you do not need to perform any additional steps after Attaching a Volume, the volumes are connected automatically. However, for Linux-based images, if you want to mount these volumes on instance boot, you need to perform additional configuration steps. If you specified a device path when you attached the volume, see fstab Options for Block Volumes Using Consistent Device Paths. If you did not specify a device path or if your instance was created from an image that does not support device paths, see Traditional fstab Options.

For volumes attached with iSCSI as the volume attachment type, you need to connect and mount the volume from the instance for the volume to be usable. For more information about attachment type options, see Volume Attachment Types. In order to connect the volume, you must first attach the volume to the instance, see Attaching a Volume.

Connecting to iSCSI-Attached Volumes

Required IAM Policy

Connecting a volume to an instance does not require a specific IAM policy. However, you may need permission to run the necessary commands on the instance's guest OS. Contact your system administrator for more information.

Prerequisites

You must attach the volume to the instance before you can connect the volume to the instance's guest OS. For details, see Attaching a Volume.

To connect the volume, you need the following information:

- iSCSI IP Address
- iSCSI Port numbers
- CHAP credentials (if you enabled CHAP)
- IQN

The Console provides the commands required to configure, authenticate, and log on to iSCSI.

Connecting to a Volume on a Linux Instance

1. Use the Console to obtain the iSCSI data you need to connect the volume:
    a. Log on to Oracle Cloud Infrastructure.
    b. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
    c. Click the name of the instance to display the instance details.
    d. In the **Resources** section on the **Instance Details** page, click **Attached Block Volumes** to view the attached block volume.

e. Click the Actions icon (three dots) next to the volume you're interested in, and then click **iSCSI Commands and Information**.

   The **iSCSI Commands and Information** dialog box displays specific identifying information about your volume and the iSCSI commands you'll need. The commands are ready to use with the appropriate information included. You can copy and paste the commands into your instance session window for each of the following steps.

2. Log on to your instance's guest OS.
3. Register the volume with the `iscsiadm` tool.

   ```
   iscsiadm -m node -o new -T <volume IQN> -p <iSCSI IP address>:<iSCSI port>
   ```

   A successful registration response resembles the following:

   ```
   New iSCSI node [tcp:[hw=,ip=,net_if=,iscsi_if=default] 169.254.0.2,3260,-1 iqn.2015-
   12.us.oracle.com:c6acda73-90b4-4bbb-9a75-faux09015418] added
   ```

4. Configure iSCSI to automatically connect to the authenticated block storage volumes after a reboot:

   ```
   iscsiadm -m node -T <volume IQN> -o update -n node.startup -v automatic
   ```

   Note: All command arguments are essential. Success returns no response.

5. Skip this step if CHAP is not enabled. If you enabled CHAP when you attached the volume, authenticate the iSCSI connection by providing the volume's CHAP credentials as follows:

   ```
   iscsiadm -m node -T <volume IQN> -p <iSCSI IP address>:<iSCSI port> -o update -n
   node.session.auth.authmethod -v CHAP
   ```

   ```
   iscsiadm -m node -T <volume IQN> -p <iSCSI IP address>:<iSCSI port> -o update -n
   node.session.auth.username -v <CHAP user name>
   ```

   ```
   iscsiadm -m node -T <volume's IQN> -p <iSCSI IP address>:<iSCSI port> -o update -n
   node.session.auth.password -v <CHAP password>
   ```

   Success returns no response.

6. Log in to iSCSI:

```
iscsiadm -m node -T <volume's IQN> -p <iSCSI IP Address>:<iSCSI port> -l
```

A successful login response resembles the following:

```
Logging in to [iface: default, target: iqn.2015-12.us.oracle.com:c6acda73-90b4-4bbb-9a75-
faux09015418, portal: 169.254.0.2,3260] (multiple)
Login to [iface: default, target: iqn.2015-12.us.oracle.com:c6acda73-90b4-4bbb-9a75-faux09015418,
portal: 169.254.0.2,3260] successful.
```

7. You can now format (if needed) and mount the volume. To get a list of mountable iSCSI devices on the instance, run the following command:

```
fdisk -l
```

The connected volume listing resembles the following:

```
Disk /dev/sdb: 274.9 GB, 274877906944 bytes, 536870912 sectors
Units = sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
```

Tip

If you have multiple volumes that do not have CHAP enabled, you can log in to them all at once by using the following commands:

```
iscsiadm -m discovery -t sendtargets -p <iSCSI IP
address>:<iSCSI port>
iscsiadm -m node -l
```

Connecting to a Volume on a Windows Instance

Warning

> When connecting to a Windows boot volume as a data volume from a second instance, you need to append `-IsMultipathEnabled $True` to the `Connect-IscsiTarget` command. See Attaching a Windows boot volume as a data volume to another instance fails for more information.

1. Use the Console to obtain the iSCSI data you need to connect the volume:
    a. Log on to Oracle Cloud Infrastructure.
    b. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
    c. Click your instance's name to display the instance details.
    d. In the **Resources** section on the **Instance Details** page, click **Attached Block Volumes** to view the attached block volume.
    e. Click the Actions icon (three dots) next to the volume you're interested in, and then click **iSCSI Commands and Information**.
    The **iSCSI Commands and Information** dialog box displays your volume's IP address and port, which you'll need to know later in this procedure.
2. Log in to your instance using a Remote Desktop client.
3. On your Windows instance, open the iSCSI Initiator. The steps to open the iSCSI Initiator may vary depending on the version of Windows.
    For example: Open **Server Manager**, click **Tools**, and then select **iSCSI Initiator**.
4. In the iSCSI Initiator Properties dialog box, click the **Discovery** tab, and then click **Discover Portal**.
5. Enter the block volume **IP Address** and **Port**, and then click **OK**.
6. Click the **Targets** tab.
7. Under **Discovered targets**, select the volume IQN.
8. Click **Connect**.

9. Make sure that the **Add this connection to the list of favorite targets** check box is selected, and then click **OK**.
10. You can now format (if needed) and mount the volume. To view a list of mountable iSCSI devices on your instance, in **Server Manager**, click **File and Storage Services**, and then click **Disks**.
    The disk is displayed in the list.

fstab Options for Block Volumes Using Consistent Device Paths

On Linux instances, if you want to automatically mount volumes on instance boot, you need to set some specific options in the `/etc/fstab` file, or the instance may fail to launch.

Note

These steps are for block volumes that are attached with consistent device paths enabled. If the block volume does not have consistent device paths enabled, use the legacy etc/fstab options instead.

Prerequisites

Before using a consistent device path, you should confirm that the instance supports consistent device paths and is correctly configured.

To verify that the volume is attached to a supported instance, connect to the instance and run the following command:

```
ll /dev/oracleoci/oraclevd*
```

The output will look similar to the following:

```
lrwxrwxrwx. 1 root root 6 Feb  7 21:02 /dev/oracleoci/oraclevda -> ../sda
lrwxrwxrwx. 1 root root 7 Feb  7 21:02 /dev/oracleoci/oraclevda1 -> ../sda1
lrwxrwxrwx. 1 root root 7 Feb  7 21:02 /dev/oracleoci/oraclevda2 -> ../sda2
lrwxrwxrwx. 1 root root 7 Feb  7 21:02 /dev/oracleoci/oraclevda3 -> ../sda3
```

If you don't see this output and instead see the following error message:

```
cannot access /dev/oracleoci/oraclevd*: No such file or directory
```

there may be a problem with the instance configuration for device paths. For assistance with this, contact Support.

Use the _netdev and nofail Options

By default, the `/etc/fstab` file is processed before the initiator starts. To configure the mount process to initiate before the volumes are mounted, specify the `_netdev` option on each line of the `/etc/fstab` file.

When you create a custom image of an instance where the volumes, excluding the root volume, are listed in the `/etc/fstab` file, instances will fail to launch from the custom image. To prevent this issue, specify the `nofail` option in the `/etc/fstab` file.

In the example scenario with three volumes, the `/etc/fstab` file entries for the volumes with the `_netdev` and `nofail` options are as follows:

```
/dev/oracleoci/oraclevdb /mnt/vol1 xfs defaults,_netdev,nofail 0 2
/dev/oracleoci/oraclevdc /mnt/vol2 xfs defaults,_netdev,nofail 0 2
/dev/oracleoci/oraclevdd /mnt/vol3 xfs defaults,_netdev,nofail 0 2
```

After you have updated the `/etc/fstab` file, use the following command to mount the volumes:

```
bash-4.2$ sudo mount -a
```

Reboot the instance to confirm that the volumes are mounted properly on reboot with the following command:

```
bash-4.2$ sudo reboot
```

Troubleshooting Issues with the /etc/fstab File

If the instance fails to reboot after you update the `/etc/fstab` file, you may need to undo the changes to the `/etc/fstab` file. To update the file, first connect to the serial console for the instance. When you have access to the instance using the serial console connection, you can remove, comment out, or fix the changes that you made to the `/etc/fstab` file.

Traditional fstab Options

On Linux instances, if you want to automatically mount volumes on instance boot, you need to set some specific options in the `/etc/fstab` file, or the instance may fail to launch.

Note

These steps are for block volumes that do not have consistent device paths enabled. If consistent device paths are enabled for the block volume, use the /etc/fstab options for block volumes using consistent device paths instead.

Volume UUIDs

On Linux operating systems, the order in which volumes are attached is non-deterministic, so it can change with each reboot. If you refer to a volume using the device name, such as `/dev/sdb`, and you have more than one non-root volume, you can't guarantee that the volume you intend to mount for a specific device name will be the volume mounted.

To prevent this issue, specify the volume UUID in the `/etc/fstab` file instead of the device name. When you use the UUID, the mount process matches the UUID in the superblock with the mount point specified in the `/etc/fstab` file. This process guarantees that the same volume is always mounted to the same mount point.

Determining the UUID for a Volume

1. Follow the steps to attach a volume and connect to the volume.
2. After the volumes are connected, create the file system of your choice on each volume using standard Linux tools.

   The remaining steps assume that three volumes were connected, and that an XFS file system was created on each volume.

3. Run the following command to use the **blkid** utility to get the UUIDs for the volumes:

```
sudo blkid
```

The output will look similar to the following:

```
{{ /dev/sda3: UUID="1701c7e0-7527-4338-ae9f-672fd8d24ec7" TYPE="xfs" PARTUUID="82d2ba4e-4d6e-
4a33-9c4d-ba52db57ea61"}}
{{ /dev/sda1: UUID="5750-10A1" TYPE="vfat" PARTLABEL="EFI System Partition" PARTUUID="082c26fd-
85f5-4db2-9f4e-9288a3f3e784"}}
{{ /dev/sda2: UUID="1aad7aca-689d-4f4f-aff0-e0d46fc1b89f" TYPE="swap" PARTUUID="94ee5675-a805-
49b2-aaf5-2fa15aade8d5"}}
{{ /dev/sdb: UUID="699a776a-3d8d-4c88-8f46-209101f318b6" TYPE="xfs"}}
{{ /dev/sdd: UUID="85566369-7148-4ffc-bf97-50954cae7854" TYPE="xfs"}}
{{ /dev/sdc: UUID="ba0ac1d3-58cf-4ff0-bd28-f2df532f7de9" TYPE="xfs"}}
```

The root volume in this output is `/dev/sda*`. The additional remote volumes are:

- `/dev/sdb`
- `/dev/sdc`
- `/dev/sdd`

4. To automatically attach the volumes at `/mnt/vol1`, `/mnt/vol2`, and `/mnt/vol3` respectively, create the three directories using the following commands:

```
bash-4.2$ sudo mkdir /mnt/vol1
{{ bash-4.2$ sudo mkdir /mnt/vol2}}
{{ bash-4.2$ sudo mkdir /mnt/vol3}}
```

Use the _netdev and nofail Options

By default, the `/etc/fstab` file is processed before the initiator starts. To configure the mount process to initiate before the volumes are mounted, specify the `_netdev` option on each line of the `/etc/fstab` file.

When you create a custom image of an instance where the volumes, excluding the root volume, are listed in the `/etc/fstab` file, instances will fail to launch from the custom image. To prevent this issue, specify the `nofail` option in the `/etc/fstab` file.

In the example scenario with three volumes, the `/etc/fstab` file entries for the volumes with the `_netdev` and `nofail` options are as follows:

```
UUID=699a776a-3d8d-4c88-8f46-209101f318b6 /mnt/vol1 xfs defaults,_netdev,nofail 0 2
UUID=ba0ac1d3-58cf-4ff0-bd28-f2df532f7de9 /mnt/vol2 xfs defaults,_netdev,nofail 0 2
UUID=85566369-7148-4ffc-bf97-50954cae7854 /mnt/vol3 xfs defaults,_netdev,nofail 0 2
```

After you have updated the `/etc/fstab` file, use the following command to mount the volumes:

```
bash-4.2$ sudo mount -a
```

Reboot the instance to confirm that the volumes are mounted properly on reboot with the following command:

```
bash-4.2$ sudo reboot
```

Troubleshooting Issues with the /etc/fstab File

If the instance fails to reboot after you update the `/etc/fstab` file, you may need to undo the changes to the `/etc/fstab` file. To update the file, first connect to the serial console for the instance. When you have access to the instance using the serial console connection, you can remove, comment out, or fix the changes that you made to the `/etc/fstab` file.

Listing Volumes

You can list all Block Volume volumes in a specific compartment, as well as detailed information on a single volume.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to list volumes. The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups, but not launch instances.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Block Volumes**. A detailed list of volumes in your current compartment is displayed.

- To view the volumes in a different compartment, change the compartment in the **Compartment** drop-down menu.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

List Volumes:

Get a list of volumes within a compartment.

- ListVolumes

Get a Single Volume:

Get detailed information on a single volume:

- GetVolume

Listing Volume Attachments

You can use the API to list all Block Volume volume attachments in a specific compartment, as well as detailed information on a single volume attachment.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to list volume attachments. The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups, but not launch instances.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

List Attachments:

Get information on all volume attachments in a specific compartment.

- ListVolumeAttachments

Get a Single Attachment:

Get detailed information on a single attachment.

- GetVolumeAttachment

Listing Boot Volume Attachments

You can use the API to list all the boot volume attachments in a specific compartment. You can also use the API to retrieve detailed information on a single boot volume attachment.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to list volume attachments. The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups, but not launch instances.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

List Boot Volume Attachments:

Get information on all boot volume attachments in a specific compartment.

- ListBootVolumeAttachments

Get a Single Boot Volume Attachment:

Get detailed information on a single boot volume attachment.

- GetBootVolumeAttachment

Renaming a Volume

You can use the API to change the display name of a Block Volume volume.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to rename block volumes. The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups, but not launch instances.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the API

To update a volume's display name, use the following operation:

- UpdateVolume

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Resizing a Volume

The Oracle Cloud Infrastructure Block Volume service lets you expand the size of block volumes and boot volumes. You have three options to increase the size of your volumes:

- Expand an existing volume in place with offline resizing. See Resizing a Volume Using the Console for the steps to do this.
- Restore from a volume backup to a larger volume. See Restoring a Backup to a New Volume and Restoring a Boot Volume.
- Clone an existing volume to a new, larger volume. See Cloning a Volume and Cloning a Boot Volume.

For more information about the Block Volume service, see the Block Volume FAQ.

You can only increase the size of the volume, you cannot decrease the size. You can attach a volume and start using it as soon as it's resized and becomes available.

This topic describes how to expand your volume in place with offline resizing.

Warning

Before you resize a boot or block volume, you should create a backup of the volume.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK,

CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to attach/detach existing block volumes. The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups, but not launch instances.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Considerations When Resizing a Volume

Whenever you detach and re-attach volumes, there are complexities and risks for both Linux-based and Windows-based instances. This applies to both paravirtualized and iSCSI attachment types. You should keep the following in mind when resizing volumes:

- When you re-attach a volume to an instance after resizing, if you are not using consistent device paths, or the instance does not support consistent device paths, device order and path may change. If you are using a tool such as Logical Volume Manager (LVM), you may need to fix the device mappings. For more information about consistent device paths, see Connecting to Volumes With Consistent Device Paths.
- When you detach and then re-attach an iSCSI-attached volume to an instance, the volume's IP address will increment.
- Before you resize a volume, you should create a full backup of the volume.

Resizing a Volume Using the Console

Resizing a Block Volume

1. Detach the block volume, see Detaching a Volume.

2. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Block Volumes**.
3. In the **Block Volumes** list, click the block volume you want to resize.
4. Click **Resize**.
5. Specify the new size and click **Resize**. You must specify a larger value than the block volume's current size.
6. Reattach the block volume, see Attaching a Volume.
7. Extend the partition, see Extending the Partition for a Block Volume.

Resizing a Boot Volume for a Windows Instance

1. Stop the instance, see Stopping and Starting an Instance.
2. Detach the boot volume, see Detaching a Boot Volume.
3. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Boot Volumes**.
4. In the **Boot Volumes** list, click the boot volume you want to resize.
5. Click **Resize**.
6. Specify the new size and click **Resize**. You must specify a larger value than the boot volume's current size.
7. Reattach the boot volume, see Attaching a Boot Volume.
8. Restart the instance, see Stopping and Starting an Instance.
9. Extend the partition, see Extending the System Partition on a Windows-Based Image.

Resizing a Boot Volume for a Linux Instance

1. Stop the instance, see Stopping and Starting an Instance.
2. Detach the boot volume, see Detaching a Boot Volume.

3. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Boot Volumes**.
4. In the **Boot Volumes** list, click the boot volume you want to resize.
5. Click **Resize**.
6. Specify the new size and click **Resize**. You must specify a larger value than the boot volume's current size.
7. Attach the boot volume to a second instance as a data volume. See Attaching a Volume and Connecting to a Volume.
8. Extend the partition and grow the file system, see Extending the Root Partition on a Linux-Based Image.
9. Reattach the boot volume, see Attaching a Boot Volume.
10. Restart the instance, see Stopping and Starting an Instance.

Extending the Partition for a Block Volume

The Oracle Cloud Infrastructure Block Volume service lets you expand the size of block volumes with offline volume resizing. For more information, see Resizing a Volume. In order to take advantage of the larger volume size, you need to extend the partition for the block volume.

Required IAM Policy

Extending a partition on an instance does not require a specific IAM policy. However, you may need permission to run the necessary commands on the instance's guest OS. Contact your system administrator for more information.

Extending a Partition on a Linux-Based Image

On Linux-based images, use the following steps to extend the partition for a block volume.

PREREQUISITES

After you have resized a volume, you need to attach it to an instance before you can extend the partition and grow the file system. See Attaching a Volume and Connecting to a Volume for more information.

EXTENDING THE LINUX PARTITION

Extending a partition

1. To identify the volume that you want to extend the partition for, run the following command to list the attached block volumes:

   ```
   lsblk
   ```

2. Run the following command to edit the volume's partition table with `parted`:

   ```
   parted <volume_id>
   ```

   <volume_id> is the volume identifier, for example `/dev/sdc`.

3. When you run `parted`, you may encounter the following error message:

   ```
   Warning: Not all of the space available to <volume_id> appears to be used,
   you can fix the GPT to use all of the space (an extra volume_size blocks)
   or continue with the current setting?
   ```

   You are then prompted to fix the error or ignore the error and continue with the current setting. Specify the option to fix the error.

4. Run the following command to change the display units to sectors so that you can see the precise start position for the volume:

   ```
   (parted) unit s
   ```

5. Run the following command to display the current partitions in the partition table:

   ```
   (parted) print
   ```

   Make note of the values in the **Number**, **Start**, and **File system** columns for the root partition.

6. Run the following command to remove the existing root partition:

   ```
   (parted) rm <partition_number>
   ```

   <partition_number> is the value from the **Number** column.

7. Run the following command to recreate the partition:

   ```
   (parted) mkpart
   ```

   At the `Start?` prompt, specify the value from the **Start** column. At the `File system type?` prompt, specify the value from the **File system** column. Specify `100%` for the `End?` prompt.

8. Run the following command to exit `parted`:

   ```
   (parted) quit
   ```

   This command forces a rewrite of the partition table with the new partition settings that you specified.

9. To verify that the root partition was extended, run the following command to list the attached block volumes:

   ```
   lsblk
   ```

After you extend the root partition you need to grow the file system. The steps in the following procedure apply only to xfs file systems.

Growing the file system for a partition

1. Before you grow the file system, repair any issues with the file system on the extended partition by running the following command:

   ```
   xfs_repair <partition_id>
   ```

   <partition_id> is the partition identifier, for example `/dev/sdc1`. See Checking and Repairing an XFS File System for more information.

2. After you have confirmed that there are no more issues to repair, you need to create a mount point to run the `xfs_growfs` against. To do this, create a directory and mount the partition to that directory by running the following commands:

   ```
   mkdir <directory_name>
   mount <partition_id> <directory_name> -o nouuid
   ```

   <partition_id> is the partition identifier, for example `/dev/sdc1`, and *<directory_name>* is the directory name, for example `data`.

3. After you have created the mount point run the following command to grow the file system:

   ```
   xfs_growfs -d <directory_name>
   ```

   <directory_name> is the name for the directory you created in the previous step, for example `data`.

4. To verify that the file system size is correct, run the following command to display the file system details:

   ```
   df -lh
   ```

Extending a Partition on a Windows-Based Image

On Windows-based images, you can extend a partition using the Windows interface or from the command line using the DISKPART utility.

Windows Server 2016 and Windows Server 2012

The steps to extend a partition for a block volume attached to an instance running Windows 2012 or Windows 2016 are the same, and are described in the following procedures.

Extending a partition using the Windows interface

1. Open the Disk Management system utility on the instance.
2. Right-click the expanded block volume and select **Extend Volume**.

3. Follow the instructions in the **Extend Volume Wizard**:
    a. Select the disk that you want to extend, enter the size, and then click **Next**.
    b. Confirm that the disk and size settings are correct, and then click **Finish**.
4. Verify that the block volume's disk has been extended in Disk Management.

Extending a partition using the command line with DISKPART

1. Open a command prompt as administrator on the instance.
2. Run the following command to start the DISKPART utility:

```
diskpart
```

3. At the `DISKPART` prompt, run the following command to display the instance's volumes:

```
list volume
```

4. Run the following command to select the expanded block volume:

```
select volume <volume_number>
```

<volume_number> is the number associated with the block volume that you want to extend the partition for.

5. Run the following command to extend the partition:

```
extend size=<increased_size_in_MB>
```

<increased_size_in_MB> is the size in MB that you want to extend the partition to.

Warning

When using the DISKPART utility, do not overextend the partition beyond the current available space. Overextending the partition could result in data loss.

6. To confirm that the partition was extended, run the following command and verify that the block volume's partition has been extended:

```
list volume
```

WINDOWS SERVER 2008

Use the steps described in the following procedures to extend a partition on instances running Windows 2008.

Extending the system partition using the Windows interface

1. Open the Server Manager on the instance.
2. Expand the **Storage** node in the left navigation pane and click **Disk Management**.
3. Right-click the expanded block volume and select **Extend Volume**.
4. Follow the instructions in the **Extend Volume Wizard**:
    a. Select the disk that you want to extend, enter the size, and then click **Next**.
    b. Confirm that the disk and size settings are correct, and then click **Finish**.
5. Verify that the block volume's disk has been extended in the Server Manager's **Disk Management** node.

Extending a partition using the command line with DISKPART

1. Open a command prompt as administrator on the instance.
2. Run the following command to start the DISKPART utility:

```
diskpart
```

3. At the `DISKPART` prompt, run the following command to display the instance's volumes:

```
list volume
```

4. Run the following command to select the expanded block volume:

```
select volume <volume_number>
```

   <volume_number> is the number associated with the block volume that you want to extend the partition for.

5. Run the following command to extend the partition:

```
extend size=<increased_size_in_MB>
```

   <increased_size_in_MB> is the size in MB that you want to extend the partition to.

Warning

When using the DISKPART utility, do not overextend the partition beyond the current available space. Overextending the partition could result in data loss.

6. To confirm that the partition was extended, run the following command and verify that the boot volume's partition has been extended:

```
list volume
```

Overview of Block Volume Backups

The backups feature of the Oracle Cloud Infrastructure Block Volume service lets you make a point-in-time backup of data on a block volume. These backups can then be restored to new volumes either immediately after a backup or at a later time that you choose.

Backups are encrypted and stored in Oracle Cloud Infrastructure Object Storage, and can be restored as new volumes to any availability domain within the same region they are stored. This capability provides you with a spare copy of a volume and gives you the ability to successfully complete disaster recovery within the same region.

There are two ways you can initiate a backup, either by manually starting the backup, or by assigning a policy which defines a set backup schedule.

Manual Backups

These are on-demand one-off backups that you can launch immediately by following the steps described in Backing Up a Volume. When launching a manual backup, you can specify whether an incremental or a full backup should be performed. See Volume Backup Types for more information about backup types.

Policy-Based Backups

These are automated scheduled backups. Each backup policy has a set backup frequency and retention period. There are three predefined policies, Bronze, Silver, and Gold.

See Policy-Based Backups for more information.

Volume Backup Types

There are two backup types available in the Block Volume service:

- **Incremental:** This backup type includes only the changes since the last backup.
- **Full:** This backup type includes all changes since the volume was created.

Note

Backup Details

Backups are not an identical copy of the volume being backed up. For incremental backups, they are a record of all the changes since the last backup. For full backups, they are a record of all the changes since the volume was created. For example, in a scenario where you create a 16 TB block volume, modify 40 GB on the volume, and then launch a full backup, upon completion the volume backup size is 40 GB.

Planning Your Backup

The primary use of backups is to support business continuity, disaster recovery, and long-term archiving requirements. When determining a backup schedule, your backup plan and goals should consider the following:

- **Frequency:** How often you want to back up your data.
- **Recovery time:** How long you can wait for a backup to be restored and accessible to the applications that use it. The time for a backup to complete varies on several factors, but it will generally take a few minutes or longer, depending on the size of the data being backed up and the amount of data that has changed since your last backup.
- **Number of stored backups:** How many backups you need to keep available and the deletion schedule for those you no longer need. You can only create one backup at a time, so if a backup is underway, it will need to complete before you can create another one. For details about the number of backups you can store, see Block Volume Capabilities and Limits.

The common use cases for using backups are:

- Needing to create multiple copies of the same volume. Backups are highly useful in cases where you need to create many instances with many volumes that need to have the same data formation.
- Taking a snapshot of your work that you can restore to a new volume at a later time.
- Ensuring you have a spare copy of your volume in case something goes wrong with your primary copy.

Copying Block Volume Backups Across Regions

You can copy block volume backups between regions using the Console, command line interface (CLI), SDKs, or REST APIs. For steps, see Copying a Volume Backup Between Regions. This capability enhances the following scenarios:

- **Disaster recovery and business continuity:** By copying block volume backups to another region at regular intervals, it makes it easier for you to rebuild applications and data in the destination region if a region-wide disaster occurs in the source region.
- **Migration and expansion:** You can easily migrate and expand your applications to another region.

To copy volume backups between regions, you must have permission to read and copy volume backups in the source region, and permission to create volume backups in the destination region. For more information see Required IAM Policy.

Once you have copied the volume backup to the new region you can then restore from that backup by creating a new volume from the backup using the steps described in Restoring a Backup to a New Volume.

Volume Backup Encryption

The Oracle Cloud Infrastructure Block Volume service always encrypts all block volumes, boot volumes, and volume backups at rest by using the Advanced Encryption Standard (AES) algorithm with 256-bit encryption.

The Oracle Cloud Infrastructure Key Management service enables you to bring and manage your own keys to use for encrypting volumes and their backups. When you create a volume backup, the encryption key used for the volume is also used for the volume backup. When you restore the backup to create a new volume you configure a new key, see Restoring a Backup to a New Volume. See also Overview of Key Management.

If you do not configure a volume to use the Key Management service, the Block Volume service uses the Oracle-provided encryption key instead. This applies to both encryption at-rest and in-transit encryption.

Best Practices When Creating Block Volume Backups

When creating and restoring from backups, keep in mind the following:

- Before creating a backup, you should ensure that the data is consistent: Sync the file system, unmount the file system if possible, and save your application data. Only the data on the disk will be backed up. When creating a backup, after the backup state changes from REQUEST_RECEIVED to CREATING, you can return to writing data to the volume. While a backup is in progress, the volume that is being backed up cannot be deleted.
- If you want to attach a restored volume that has the original volume attached, be aware that some operating systems do not allow you to restore identical volumes. To resolve this, you should change the partition IDs before restoring the volume. The steps to change an operating system's partition ID vary by operating system. For instructions, see your operating system's documentation.
- You should not delete the original volume until you have verified that the backup you created of it completed successfully.

See Backing Up a Volume and Restoring a Backup to a New Volume for more information.

Differences Between Block Volume Backups and Clones

Consider the following criteria when you decide whether to create a backup or a clone of a volume.

	Volume Backup	**Volume Clone**
Description	Creates a point-in-time backup of data on a volume. You can restore multiple new volumes from the backup later in the future.	Creates a single point-in-time copy of a volume without having to go through the backup and restore process.
Use case	Retain a backup of the data in a volume, so that you can duplicate an environment later or preserve the data for future use. Meet compliance and regulatory requirements, because the data in a backup remains unchanged over time. Support business continuity requirements. Reduce the risk of outages or data mutation over time.	Rapidly duplicate an existing environment. For example, you can use a clone to test configuration changes without impacting your production environment.
Speed	Slower (minutes or hours)	Faster (seconds)
Cost	Lower cost	Higher cost
Storage location	Object Storage	Block Volume

	Volume Backup	Volume Clone
Retention policy	Policy-based backups expire, manual backups do not expire	No expiration
Volume groups	Supported. You can back up a volume group.	Supported. You can clone a volume group.

For background information and steps to clone a block volume, see Cloning a Volume.

Using the CLI or REST APIs to Customize and Manage the Lifecycle of Volume Backups

You can use the CLI, REST APIs, or the SDKs to automate, script, and manage volume backups and their lifecycle.

Using the CLI

This section provides basic sample CLI commands that you can use in a script, such as a cron job run by the cron utility on Linux-based operating systems, to perform automatic backups at specific times. For information about using the CLI, see Command Line Interface (CLI).

To create a manual backup of the specified block volume

Open a command prompt and run:

```
oci bv backup create --volume-id <block_volume_OCID> --display-name <Name> --type <FULL|INCREMENTAL>
```

For example:

```
oci bv backup create --volume-id  ocid1.volume.oc1..<unique_ID> --display-name "backup display name" --
type FULL
```

To delete a block volume backup

Open a command prompt and run:

```
oci bv backup delete --volume-backup-id <volume_backup_OCID>
```

For example:

```
oci bv backup delete --volume-backup-id ocid1.volume.oc1..<unique_ID>
```

To create a manual backup of the specified boot volume

Open a command prompt and run:

```
oci bv boot-volume-backup create --volume-id <boot_volume_OCID> --display-name <Name> --type
<FULL|INCREMENTAL>
```

For example:

```
oci bv boot-volume-backup create --volume-id  ocid1.volume.oc1..<unique_ID> --display-name "backup
display name" --type FULL
```

To delete a boot volume backup

Open a command prompt and run:

```
oci bv backup delete --boot-volume-backup-id <boot_volume__backup_OCID>
```

For example:

```
oci bv backup delete --boot-volume-backup-id ocid1.volume.oc1..<unique_ID>
```

To list the Oracle-defined backup policies

Open a command prompt and run:

```
oci bv volume-backup-policy list
```

To assign an Oracle-defined backup policy to a boot or block volume

Open a command prompt and run:

```
oci bv volume-backup-policy-assignment create --asset-id <volume_OCID> --policy-id <policy_OCID>
```

For example:

```
oci bv volume-backup-policy-assignment create --asset-id  ocid1.volume.oc1..<unique_ID> --policy-id
ocid1.volumebackuppolicy.oc1..<unique_ID>
```

To un-assign an Oracle-defined backup policy from a boot or block volume

Open a command prompt and run:

```
oci bv volume-backup-policy-assignment delete --policy-assignment-id <policy_assignment_OCID>
```

For example:

```
oci bv volume-backup-policy-assignment delete --policy-assignment-id
ocid1.volumebackuppolicyassign.oc1..<unique_ID>
```

To retrieve the backup policy assignment ID for a boot or block volume

Open a command prompt and run:

```
oci bv volume-backup-policy-assignment get-volume-backup-policy-asset-assignment --asset-id <volume_
OCID>
```

For example:

```
oci bv volume-backup-policy-assignment get-volume-backup-policy-asset-assignment --asset-id
ocid1.volume.oc1..<unique_ID>
```

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations for working with block volume backups, boot volume backups, and backup policies.

Block Volume Backups

- CreateVolumeBackup
- DeleteVolumeBackup
- GetVolumeBackup
- ListVolumeBackups
- UpdateVolumeBackup

Boot Volume Backups

- CreateBootVolumeBackup
- DeleteBootVolumeBackup
- GetBootVolumeBackup
- ListBootVolumeBackups
- UpdateBootVolumeBackup

Volume Backup Policies and Policy Assignments

- GetVolumeBackupPolicy
- ListVolumeBackupPolicies
- CreateVolumeBackupPolicyAssignment
- DeleteVolumeBackupPolicyAssignment
- GetVolumeBackupPolicyAssetAssignment
- GetVolumeBackupPolicyAssignment

Backing Up a Volume

You can create a backup of a volume using Block Volume.

For information to help you decide whether to create a backup or a clone of a boot volume, see Differences Between Block Volume Backups and Clones.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups. The policy in Let volume backup admins manage only backups further restricts access to just creating and managing backups.

Tip

When users create a backup from a volume or restore a volume from a backup, the volume and backup don't have to be in the same compartment. However, users must have access to both compartments.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Block Volumes**.
2. Click the block volume that you want to create a backup for.
3. Click **Create Manual Backup**.
4. Enter a name for the backup.
5. Select the backup type, either incremental or full. See Volume Backup Types for

information about backup types.

6. Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
7. Click **Create Backup**.
   The backup will be completed once its icon no longer lists it as **CREATING** in the volume list.

Using the API

To back up a volume, use the following operation:

- CreateVolumeBackup

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

For more information about backups, see Overview of Block Volume Backups and Restoring a Backup to a New Volume.

Policy-Based Backups

The Oracle Cloud Infrastructure Block Volume service provides you with the capability to perform volume backups automatically on a schedule and retain them based on the selected backup policy. This allows you to adhere to your data compliance and regulatory requirements.

Warning

Deleting Block Volumes with Policy-Based Backups

All policy-based backups will eventually expire, so if you want to keep a volume backup indefinitely, you need to create a manual backup.

Volume Backup Policies

There are three predefined backup policies, Bronze, Silver, and Gold. Each backup policy has a set backup frequency and retention period.

Bronze Policy

The bronze policy includes monthly incremental backups, run on the first day of the month. These backups are retained for twelve months. This policy also includes a full backup, run yearly on January 1st. Full backups are retained for five years.

Silver Policy

The silver policy includes weekly incremental backups that run on Sunday. These backups are retained for four weeks. This policy also includes monthly incremental backups, run on the first day of the month and are retained for twelve months. Also includes a full backup, run yearly on January 1st. Full backups are retained for five years.

Gold Policy

The gold policy includes daily incremental backups. These backups are retained for seven days. This policy also includes weekly incremental backups that run on Sunday and are retained for four weeks. Also includes monthly incremental backups, run on the first day of the month, retained for twelve months, and a full backup, run yearly on January 1st. Full backups are retained for five years.

Assigning a Backup Policy to Volumes

When you create a new volume on Oracle Cloud Infrastructure you can select the appropriate backup policy at that time, for more information, see Creating a Volume.

If your requirements change, you can adjust the schedule and retention period by selecting a different backup policy or by removing it all together. You can also assign a backup policy to an existing volume. See Using the Console.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

Important

To view or work with backup policies, you need access to the root compartment, which is where the predefined backup policies are located.

For administrators: The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups. The policy in Let volume backup admins manage only backups further restricts access to just creating and managing backups.

Tip

When users create a backup from a volume or restore a volume from a backup, the volume and backup don't have to be in the same compartment. However, users must have access to both compartments.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

You can use the Console to assign or change the backup policy for an existing volume.

To assign a backup policy

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Block Volumes**.
2. Click the volume for which you want to assign a backup policy to.
3. Click **Assign Backup Policy**.
4. Select the appropriate backup policy for your requirements.
5. Click **Assign Backup Policy**.

To remove a backup policy

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Block Volumes**.
2. Click the volume for which you want to remove the backup policy for.
3. Click **Remove Backup Policy**.

4. Click **OK** to confirm the backup policy removal.

To change a backup policy

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Block Volumes**.
2. Click the volume for which you want to change the backup policy for.
3. Click **Remove Backup Policy**.
4. Click **OK** to confirm the backup policy removal.
5. Click **Assign Backup Policy**.
6. Select the backup policy you want to switch to.
7. Click **Assign Backup Policy**.

For more information about backups, see Overview of Block Volume Backups and Restoring a Backup to a New Volume.

Copying a Volume Backup Between Regions

You can copy volume backups from one region to another region using the Oracle Cloud Infrastructure Block Volume service. For more information, see Copying Block Volume Backups Across Regions.

Note

Limitations for Copying Volume Backups Across Regions

Copying backups for block volumes encrypted using Key Management across regions is not supported.

Copying boot volume backups across regions is not supported.

When copying block volume backups across regions in your tenancy, you can only copy one backup at a time from a specific source region.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The first two statements listed in the Let volume admins manage block volumes, backups, and volume groups policy lets the specified group do everything with block volumes and backups with the exception of copying volume backups across regions. The aggregate resource type `volume-family` does not include the `VOLUME_BACKUP_COPY` permission, so to enable copying volume backups across regions you need to ensure that you include the third statement in that policy, which is:

```
Allow group VolumeAdmins to copy volume-backups in tenancy
```

To restrict access to just creating and managing volume backups, including copying volume backups between regions, use the policy in Let volume backup admins manage only backups. The individual resource type `volume-backups` includes the `VOLUME_BACKUP_COPY` permission, so you do not need to specify it explicitly in this policy.

Restricting Access

The specific permissions needed to copy volume backups across regions are:

- **Source region**: `VOLUME_BACKUP_READ`, `VOLUME_BACKUP_COPY`
- **Destination region**: `VOLUME_BACKUP_CREATE`

Sample Policies

To restrict a group to specific source and destination regions for copying volume backups

In this example, the group is restricted to copying volume backups from the uk-london-1 region to the eu-frankfurt-1 region.

```
Allow group MyTestGroup to read volume-backups in tenancy where all {request.region='lhr'}
Allow group MyTestGroup to use volume-backups in tenancy where all {request.permission='VOLUME_BACKUP_
COPY', request.region = 'lhr',
Allow group MyTestGroup to manage volume-backups in tenancy where all {request.permission='VOLUME_
BACKUP_CREATE', request.region = 'fra'}
```

To restrict some source regions to specific destination regions while enabling all destination regions for other source regions

In this example, the following is enabled for the group:

- Manage volume backups in all regions.
- Copy volume backups from the us-phoenix-1 and us-ashburn-1 regions to any destination regions.
- Copy volume backups from the eu-frankfurt-1 and uk-london-1 regions only to the eu-frankfurt-1 or uk-london-1 regions.

```
Allow group MyTestGroup to read volume-backups in tenancy where all {request.region='lhr'}
Allow group MyTestGroup to manage volume-backups in tenancy where any {request.permission!='VOLUME_
BACKUP_COPY'}
Allow group MyTestGroup to use volume-backups in tenancy where all {request.permission='VOLUME_BACKUP_
```

```
COPY', any {request.region='lhr', request.region='fra'}, any{target.region='fra', target.region='lhr'}}
Allow group MyTestGroup to use volume-backups in tenancy where all {request.permission='VOLUME_BACKUP_
COPY', any {request.region='phx', request.region='iad'}}
```

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

1. Open the navigation menu. Under **Block Storage**, click **Block Volume Backups**. A list of the block volume backups in the compartment you're viewing is displayed. If you don’t see the one you're looking for, make sure you’re viewing the correct compartment (select from the list on the left side of the page).
2. Click the Actions icon (three dots) for the block volume backup you want to copy to another region.
3. Click **Copy to Another Region**.
4. Enter a name for the backup and choose the region to copy the backup to.
5. Click **Copy Block Volume Backup**.
6. Confirm that the source and destination region details are correct in the confirmation dialog and then click **OK**.

Using the API

To copy a volume backup to another region, use the following operation:

- CopyVolumeBackup

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Next Steps

After copying the block volume backup, switch to the destination region in the Console and verify that the copied backup appears in the list of block volume backups for that region. You can then restore the backup by creating a new block volume from it using the steps in Restoring a Backup to a New Volume.

For more information about backups, see Overview of Block Volume Backups.

Restoring a Backup to a New Volume

You can restore a backup of a volume as a new volume using Block Volume.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups.

Tip

When users create a backup from a volume or restore a volume from a backup, the volume and backup don't have to be in the same compartment. However, users must have access to both compartments.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

1. Open the navigation menu. Under **Block Storage**, click **Block Volume Backups**. A list of the block volume backups in the compartment you're viewing is displayed. If you don't see the one you're looking for, make sure you're viewing the correct compartment (select from the list on the left side of the page).
2. Click the Actions icon (three dots) for the block volume backup you want to restore.
3. Click **Create Block Volume**.
4. Enter a name for the block volume and choose the availability domain in which you want to restore it.
5. You can restore a block volume backup to a larger volume size. To do this, check **Custom Block Volume Size (GB)**, and then specify the new size. You can only increase the size of the volume, you cannot decrease the size. If you restore the block volume backup to a larger size volume, you need to extend the volume's partition, see Extending the Partition for a Block Volume for more information.
6. Optionally, you can select the appropriate backup policy for your requirements. See Policy-Based Backups for more information about backup policies.
7. Optionally, you can encrypt the data in this volume using your own Key Management encryption key. To use Key Management for your encryption needs, select the **Encrypt using Key Management** check box. Then, select the **Vault Compartment** and **Vault** that contain the master encryption key you want to use. Also select the **Master Encryption Key Compartment** and **Master Encryption Key**. For more information about encryption, see Overview of Key Management.
8. Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
9. Click **Create**.
   The volume will be ready to attach once its icon no longer lists it as **PROVISIONING** in the volume list. For more information, see Attaching a Volume.

Warning

If you want to attach a restored volume that has the original volume attached, be aware that some operating systems do not allow you to restore identical volumes. To resolve this, you should change the partition IDs before restoring the volume. How to change an operating system's partition ID varies by operating system; for instructions, see your operating system's documentation.

Using the API

The API used to restore a backup is CreateVolume. The API has an optional volumeBackupId parameter that you can use to define the backup from which the data should be restored on the newly created volume. For details, see CreateVolumeDetails Reference.

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

For more information about backups, see Overview of Block Volume Backups and Backing Up a Volume.

Cloning a Volume

You can create a clone from a volume using the Block Volume service. Cloning enables you to make a copy of an existing block volume without needing to go through the backup and restore process.

A cloned volume is a point-in-time direct disk-to-disk deep copy of the source volume, so all the data that is in the source volume when the clone is created is copied to the clone volume. Any subsequent changes to the data on the source volume are not copied to the clone. Since

the clone is a copy of the source volume it will be the same size as the source volume unless you specify a larger volume size when you create the clone.

The clone operation occurs immediately, and you can attach and use the cloned volume as a regular volume as soon as the state changes to available. At this point, the volume data is being copied in the background, and can take up to thirty minutes depending on the size of the volume.

There is a single point-in-time reference for a source volume while it is being cloned, so if the source volume is attached when a clone is created, you need to wait for the first clone operation to complete from the source volume before creating additional clones. If the source volume is detached, you can create up to ten clones from the same source volume simultaneously.

You can only create a clone for a volume within the same region, availability domain and tenant. You can create a clone for a volume between compartments as long as you have the required access permissions for the operation.

For more information about the Block Volume service and cloned volumes, see the Block Volume FAQ.

Differences Between Block Volume Clones and Backups

Consider the following criteria when you decide whether to create a backup or a clone of a volume.

	Volume Backup	**Volume Clone**
Description	Creates a point-in-time backup of data on a volume. You can restore multiple new volumes from the backup later in the future.	Creates a single point-in-time copy of a volume without having to go through the backup and restore process.
Use case	Retain a backup of the data in a volume, so that you can duplicate an environment later or preserve the data for future use. Meet compliance and regulatory requirements, because the data in a backup remains unchanged over time. Support business continuity requirements. Reduce the risk of outages or data mutation over time.	Rapidly duplicate an existing environment. For example, you can use a clone to test configuration changes without impacting your production environment.
Speed	Slower (minutes or hours)	Faster (seconds)
Cost	Lower cost	Higher cost
Storage location	Object Storage	Block Volume

	Volume Backup	Volume Clone
Retention policy	Policy-based backups expire, manual backups do not expire	No expiration
Volume groups	Supported. You can back up a volume group.	Supported. You can clone a volume group.

For more information about block volume backups, see Overview of Block Volume Backups and Backing Up a Volume.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Block Volumes**.
2. In the **Block Volumes** list, click the volume that you want to clone.
3. In **Resources**, click **Clones**.
4. Click **Create Clone**.
5. Specify a name for the clone.
6. If you want to clone the block volume to a larger size volume, select **Custom Block Volume Size (GB)** and then specify the new size. You can only increase the size of the volume, you cannot decrease the size. If you clone the block volume to a larger size volume, you need to extend the volume's partition. See Extending the Partition for a Block Volume for more information.
7. Click **Create Clone**.

The volume is ready use when its icon lists it as **AVAILABLE** in the volume list. At this point, you can perform various actions on the volume such as creating a clone from the volume, attaching it to an instance, or deleting the volume.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

To create a clone from a volume, use the CreateVolume operation and specify VolumeSourceFromVolumeDetails for CreateVolumeDetails.

Disconnecting From a Volume

For volumes attached with iSCSI as the volume attachment type you need to disconnect the volume from an instance before you detach the volume. For more information about attachment type options, see Volume Attachment Types.

Required IAM Policy

Disconnecting a volume from an instance does not require a specific IAM policy. Don't confuse this with detaching a volume (see Detaching a Volume).

Disconnecting from a Volume on a Linux Instance

Warning

Oracle recommends that you unmount and disconnect the volume from the instance using `iscsiadm` before you detach the volume. Failure to do so may lead to loss of data.

1. Log on to your instance's guest OS and unmount the volume.
2. Run the following command to disconnect the instance from the volume:

```
iscsiadm -m node -T <IQN> -p <iSCSI IP ADDRESS>:<iSCSI PORT> -u
```

A successful logout response resembles the following:

```
Logging out of session [sid: 2, target: iqn.2015-12.us.oracle.com:c6acda73-90b4-4bbb-9a75-
faux09015418, portal: 169.254.0.2,3260]
Logout of [sid: 2, target: iqn.2015-12.us.oracle.com:c6acda73-90b4-4bbb-9a75-faux09015418,
portal: 169.254.0.2,3260] successful.
```

3. You can now detach the volume without the risk of losing data.

Disconnecting from a Volume on a Windows Instance

1. Use a Remote Desktop client to log on to your Windows instance, and then open **Disk Management**.
2. Right-click the volume you want to disconnect, and then click **Offline**.
3. Open **iSCSI Initiator**, select the target, and then click **Disconnect**.
4. Confirm the session termination. The status should show as **Inactive**.
5. In **iSCSI Initiator**, click the **Favorite Targets** tab, select the target you are disconnecting, and then click **Remove**.
6. Click the **Volumes and Devices** tab, select the volume from the **Volume List**, and then click **Remove**.
7. You can now detach the volume without the risk of losing data.

Detaching a Volume

When an instance no longer needs access to a volume, you can detach the volume from the instance without affecting the volume's data.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have

permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to attach/detach existing block volumes. The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups, but not launch instances.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

Warning

For volumes attached using iSCSI Oracle recommends that you unmount and disconnect the volume from the instance using `iscsiadm` before you detach the volume. Failure to do so may lead to loss of data. See Disconnecting From a Volume for more information.

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. In the **Instance** list locate the instance. Click its name to display the instance details.
3. In the **Resources** section on the **Instance Details** page, click **Attached Block Volumes**
4. Click **Detach** next to the volume you want to detach and confirm the selection when prompted.

Using the API

To delete an attachment, use the following operation:

- DetachVolume

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Deleting a Volume

You can delete a volume that is no longer needed.

Warning

- You cannot undo this operation. Any data on a volume will be permanently deleted once the volume is deleted.
- All policy-based backups will eventually expire, so if you want to keep a volume backup indefinitely, you need to create a manual backup. See Overview of Block Volume Backups for information about policy-based and manual backups.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Block Storage** and click **Block Volumes**.
2. In the **Block Volumes** list, find the volume you want to delete.
3. Click **Terminate** next to the volume you want to delete and confirm the selection when prompted.

Using the API

To delete a volume, use the following operation:

- DeleteVolume

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Block Volume Performance

The content in the sections below apply to **Category 7** and **Section 3.b** of the Oracle PaaS and IaaS Public Cloud Services Pillar documentation.

The Oracle Cloud Infrastructure Block Volume service lets you dynamically provision and manage block storage volumes. You can create, attach, connect and move volumes as needed to meet your storage and application requirements. The Block Volume service uses NVMe-based storage infrastructure, and is designed for consistency. You just need to provision the

capacity needed and performance scales linearly per GB volume size up to the service maximums. The following table describes the performance characteristics of the service.

Metric	Characteristic
Volume Size	50 GB to 32 TB, in 1 GB increments
IOPS	60 IOPS/GB , up to 25,000 IOPS
Throughput	480 KBPS/GB, up to 320 MBPS
Latency	Sub-millisecond latencies.
Per-instance Limits	32 attachments per instance, up to 1 PB. Up to 620K or more IOPS, near line rate throughout.

The following table lists the Block Volume service's throughput and IOPS performance numbers based on volume size. If you're trying to achieve certain performance targets you can provision a minimum volume size using this table as a reference.

Volume Size	Max Throughput (1 MB block size)	Max Throughput (8 KB block size)	Max IOPS (4 KB block size)
50 GB	24 MB/s	24 MB/s	3000
100 GB	48 MB/s	48 MB/s	6000
200 GB	96 MB/s	96 MB/s	12,000
300 GB	144 MB/s	144 MB/s	18,000
400 GB	192 MB/s	192 MB/s	24,000
500 GB	240 MB/s	200 MB/s	25,000
700 GB - 32 TB	320 MB/s	200 MB/s	25,000

Note

Performance Notes for Instance Types

- The throughput performance results are for bare metal instances. Throughput performance on VM instances is dependent on the network bandwidth that is available to the instance, and further limited by that bandwidth for the volume. For details about the network bandwidth available for VM shapes, see the **Network Bandwidth** column in the VM Shapes table.
- IOPS performance is independent of the instance type or shape, so is applicable to all bare metal and VM shapes, for iSCSI attached volumes. For VM shapes with paravirtualized attached volumes, see Paravirtualized Attachment Performance.
- Latency performance is independent of the instance shape or volume size, and is always sub-millisecond at the 95th percentile.
- There is no oversubscription of resources in Oracle Cloud Infrastructure to ensure stable and predictable throughput, IOPS, and latency performance.

Note

Testing Note for Windows Instances

Windows Defender Advanced Threat Protection (Windows Defender ATP) is enabled by default on all Oracle-provided Windows images. This tool has a significant negative impact on disk I/O performance. The IOPS performance characteristics described in this topic are valid for Windows bare metal instances with Windows Defender ATP disabled for disk I/O. Customers must carefully consider the security implications of disabling Windows Defender ATP. See Windows Defender Advanced Threat Protection.

Note

Paravirtualized Attachment Performance

The IOPS performance characteristics described in this topic are for volumes with iSCSI attachments. Block Volume performance SLA for IOPS per volume and IOPS per instance applies to iSCSI volume attachments only, not to paravirtualized attachments.

Paravirtualized attachments simplify the process of configuring your block storage by removing the extra commands needed before accessing a volume. However, due to the overhead of virtualization, this reduces the maximum IOPS performance for larger block volumes. If storage IOPS performance is of paramount importance for your workloads, you can continue to experience the guaranteed performance Oracle Cloud Infrastructure Block Volume offers by using iSCSI attachments.

For more information about FIO command samples you can use for performance testing see Sample FIO Commands for Block Volume Performance Tests on Linux-based Instances.

Testing Methodology and Performance

Warning

- Before running any tests, protect your data by making a backup of your data and operating system environment to prevent any data loss.
- Do not run FIO tests directly against a device that is already in use, such as /dev/sdX. If it is in use as a formatted disk and there is data on it, running FIO with a write workload (readwrite, randrw, write, trimwrite) will overwrite the data on the disk, and cause data corruption. Run FIO only on unformatted raw devices that are not in use.

This section describes the setup of the test environments, the methodology, and the observed performance. Some of the sample volume sizes tested were:

- 50 GB volume - 3,000 IOPS @ 4K
- 1 TB volume - 25,000 IOPS @ 4K
- Host maximum, Ashburn (IAD) region, twenty 1 TB volumes - 400,000 IOPS @ 4K

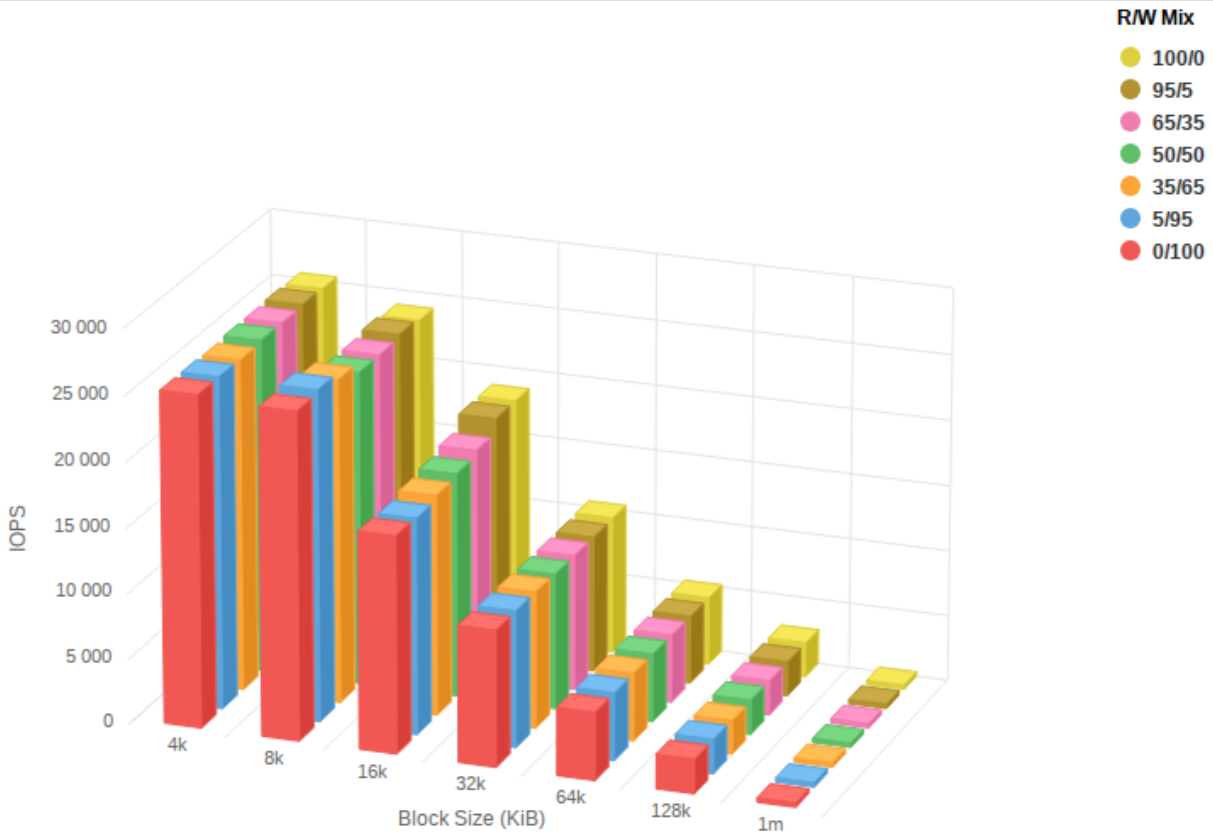
These tests used a wide range of volume sizes and the most common read and write patterns and were generated with the Gartner Cloud Harmony test suite. To show the throughput performance limits, 256k or larger block sizes should be used. For most environments, 4K, 8K, or 16K blocks are common depending on the application workload, and these are used specifically for IOPS measurements.

In the observed performance images in this section, the X axis represents the volume size tested, ranging from 4KB to 1MB. The Y axis represents the IOPS delivered. The Z axis represents the read/write mix tested, ranging from 100% read to 100% write.

Note

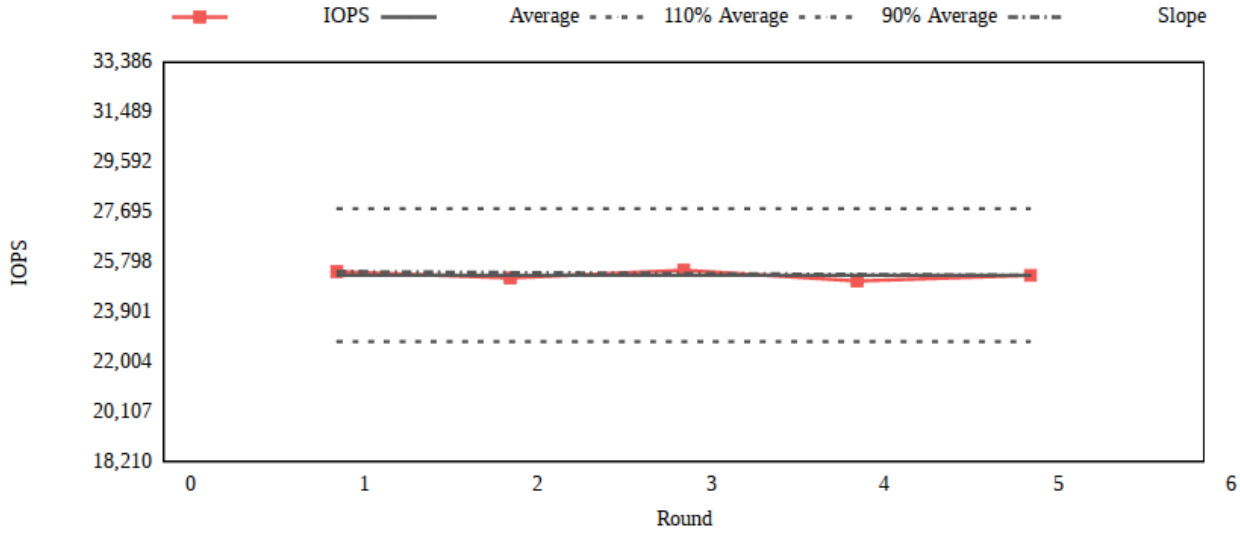
Performance Notes for Instance Types

- The throughput performance results are for bare metal instances. Throughput performance on VM instances is dependent on the network bandwidth that is available to the instance, and further limited by that bandwidth for the volume. For details about the network bandwidth available for VM shapes, see the Network Bandwidth column in the VM Shapes table.
- IOPS performance is independent of the instance type or shape, so is applicable to all bare metal and VM shapes, for iSCSI attached volumes. For VM shapes with paravirtualized attached volumes, see Paravirtualized Attachment Performance.



1 TB Block Volume

A 1 TB volume was mounted to a bare metal instance running in the Phoenix region. The instance shape was dense, workload was direct I/O with 10GB working set. The following command was run for the Gartner Cloud Harmony test suite:



```
~/block-storage/run.sh --nopurge --noprecondition --fio_direct\=1 --fio_size=10g --target /dev/sdb --
test iops --skip_blocksize 512b
```

The results showed that for 1 TB, the bandwidth limit for the larger block size test occurs at 320MBS.

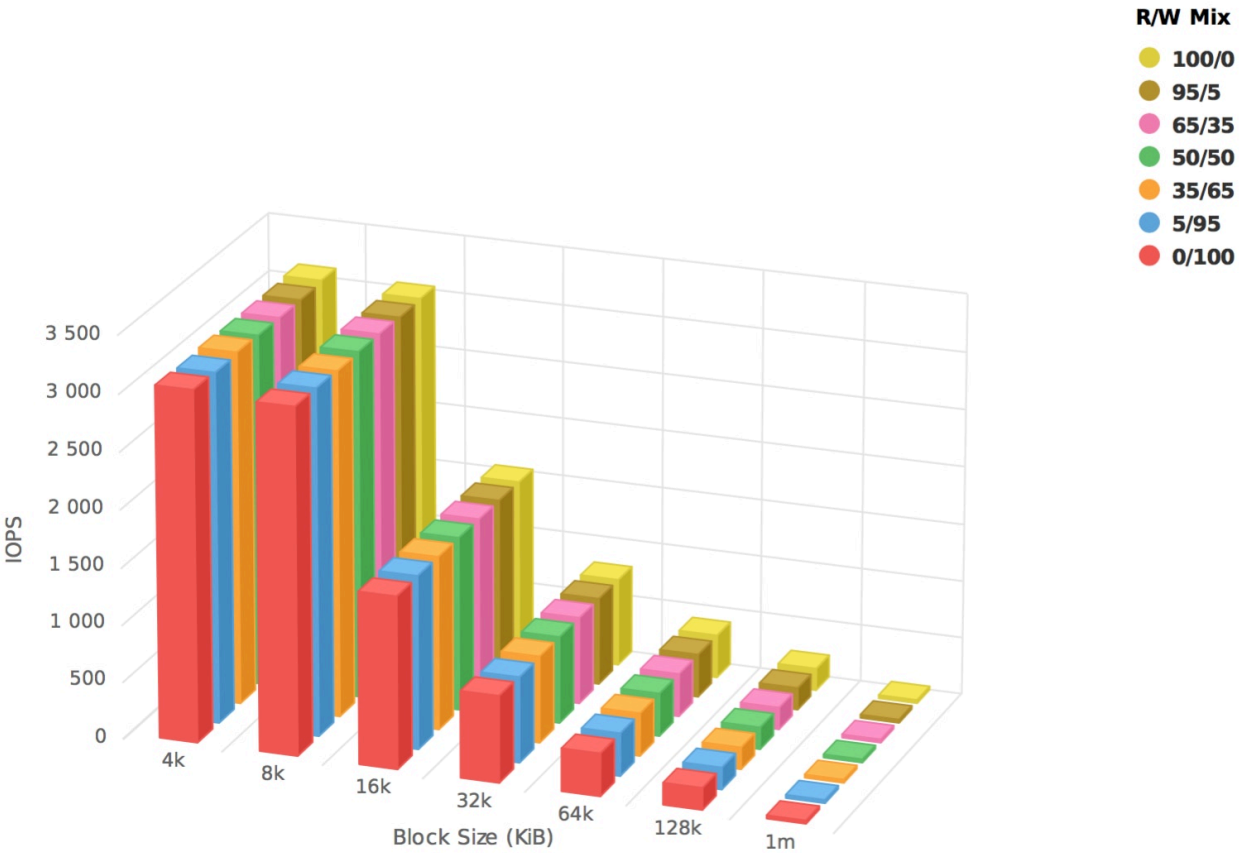
The following images show the observed performance for 1 TB:

Plot A.6 - IOPS -All RW Mix & BS - 3D Columns

Steady State Determination Data

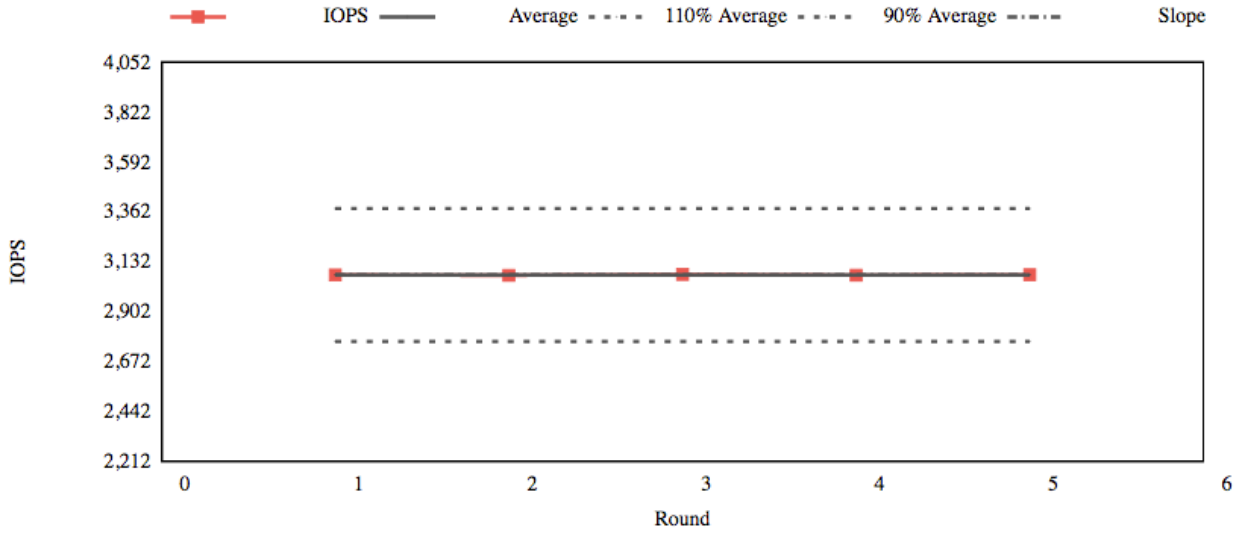
Average IOPS:			25292
Allowed Maximum Data Excursion:	5058.497	Measured Maximum Data Excursion:	410.095321
Allowed Maximum Slope Excursion:	2529.2485	Measured Maximum Slope Excursion:	159.9
Least Squares Linear Fit Formula:			-39.978 * R + 25412.418

Plot A.3 - IOPS Steady State Measurement Window - RND/4KiB



50 GB Block Volume

A 50 GB volume was mounted to a bare metal instance running in the Phoenix region. The instance shape was dense, workload was direct I/O with 10GB working set. The following command was run for the Gartner Cloud Harmony test suite:



```
~/block-storage/run.sh --nopurge --noprecondition --fio_direct=1 --fio_size=10g --target /dev/sdb --test
iops --skip_blocksize 512b
```

The results showed that for the 50 GB volume, the bandwidth limit is confirmed as 24,000 KBPS for the larger block size tests (256 KB or larger block sizes), and the maximum of 3,000 IOPS at 4K block size is delivered. For small volumes, a 4K block size is common.

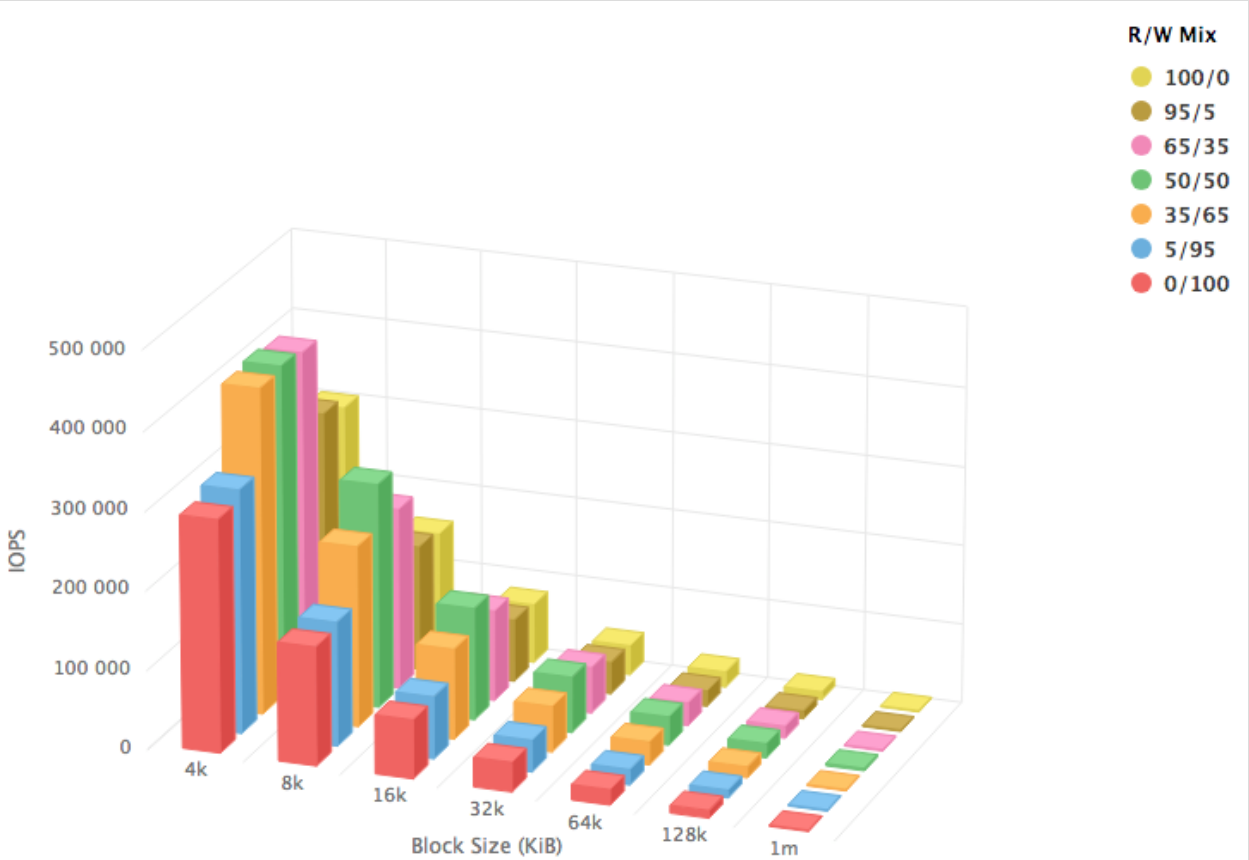
The following images show the observed performance for 50 GB:

Plot A.6 - IOPS -All RW Mix & BS - 3D Columns

Steady State Determination Data

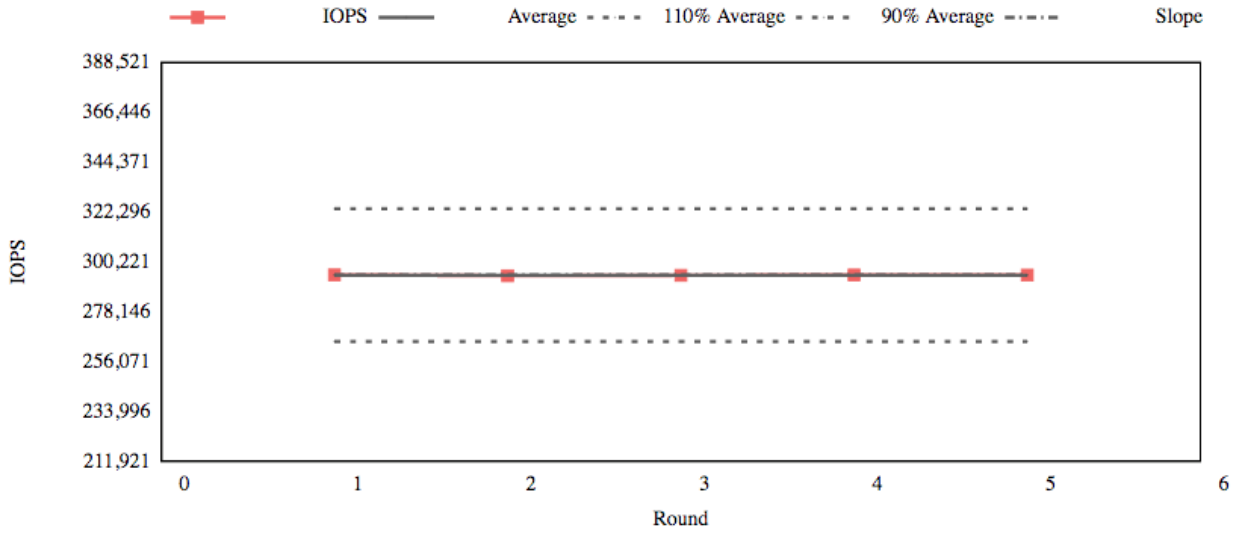
Average IOPS:			3073
Allowed Maximum Data Excursion:	614.6282	Measured Maximum Data Excursion:	4.365131
Allowed Maximum Slope Excursion:	307.3141	Measured Maximum Slope Excursion:	1.6
Least Squares Linear Fit Formula:			0.4 * R + 3071.94

Plot A.3 - IOPS Steady State Measurement Window - RND/4KiB



Host Maximum - Twenty 1 TB Volumes

Twenty 1 TB volumes were mounted to a bare metal instance running in the Ashburn region. The instance shape was dense, workload was direct I/O with 10GB working set. The following command was run for the Gartner Cloud Harmony test suite:



```
~/block-storage/run.sh --nopurge --noprecondition --fio_direct=1 --fio_size=10g --target
/dev/sdb,/dev/sdc,/dev/sdd,/dev/sde,/dev/sdf,/dev/sdg,/dev/sdh,/dev/sdi,/dev/sdj,/dev/sdk,/dev/sdl,/dev
/sdm,/dev/sdn,/dev/sdo,/dev/sdp,/dev/sdq,/dev/sdr,/dev/sds,/dev/sdt,/dev/sdu --test iops --skip_
blocksize 512b
```

The results showed that for the host maximum test of twenty 1 TB volumes, the average is 2.1GBPS, and 400,000 IOPS to the host for the 50/50 read/write pattern.

The following images show the observed performance for 50 GB:

Plot A.6 - IOPS -All RW Mix & BS - 3D Columns

Steady State Determination Data

Average IOPS:			294335
Allowed Maximum Data Excursion:	58867.0562	Measured Maximum Data Excursion:	338.11226299999
Allowed Maximum Slope Excursion:	29433.5281	Measured Maximum Slope Excursion:	58
Least Squares Linear Fit Formula:			14.492 * R + 294291.803

Sample FIO Commands for Block Volume Performance Tests on Linux-based Instances

This topic describes sample FIO commands you can use to run performance tests for the Oracle Cloud Infrastructure Block Volume service on instances created from Linux-based images.

Installing FIO

To install and configure FIO on your instances with Linux-based operating systems run the commands applicable to the operating system version for your instance.

Oracle Linux and CentOS

Run the following command to install and configure FIO for your Oracle Linux CentOS systems:

```
sudo yum install fio -y
```

This applies to Oracle Linux 6.x, Oracle Linux 7.x, CentOS 6.x, and CentOS 7.x.

Ubuntu

Run the following commands to install and configure FIO for your Ubuntu systems:

```
sudo apt-get update && sudo apt-get install fio -y
```

This applies to Ubuntu 14.04, 16.04, 18.04, and Ubuntu Minimal 16.04, 18.04.

FIO Commands

IOPS Performance Tests

Use the following FIO example commands to test IOPS performance. You can run the commands directly or create a job file with the command and then run the job file.

Test random reads

Run the following command directly to test random reads:

```
sudo fio --filename=device name --direct=1 --rw=randread --bs=4k --ioengine=libaio --iodepth=256 --
runtime=120 --numjobs=4 --time_based --group_reporting --name=iops-test-job --eta-newline=1 --readonly
```

In some cases you may see more consistent results if you use a job file instead of running the command directly. Use the following steps for this approach.

1. Create a job file, fiorandomread.fio, with the following:

   ```
   [global]
   bs=4K
   iodepth=256
   ```

```
direct=1
ioengine=libaio
group_reporting
time_based
runtime=120
numjobs=4
name=raw-randread
rw=randread

[job1]
filename=device name
```

2. Run the job using the following command:

```
fio randomread.fio
```

Test file random read/writes

Run the following command against the mount point to test file read/writes:

```
sudo fio --filename=/custom mount point/file --size=500GB --direct=1 --rw=randrw --bs=4k --
ioengine=libaio --iodepth=256 --runtime=120 --numjobs=4 --time_based --group_reporting --name=iops-test-
job --eta-newline=1
```

Add both the read IOPS and the write IOPS returned.

Test random read/writes

Warning

Do not run FIO tests with a write workload (`readwrite`, `randrw`, `write`, `trimwrite`) directly against a device that is in use.

Run the following command to test random read/writes:

```
sudo fio --filename=device name --direct=1 --rw=randrw --bs=4k --ioengine=libaio --iodepth=256 --
runtime=120 --numjobs=4 --time_based --group_reporting --name=iops-test-job --eta-newline=1
```

Add both the read IOPS and the write IOPS returned.

In some cases you may see more consistent results if you use a job file instead of running the command directly. Use the following steps for this approach.

1. Create a job file, fiorandomreadwrite.fio, with the following:

   ```
   [global]
   bs=4K
   iodepth=256
   direct=1
   ioengine=libaio
   group_reporting
   time_based
   runtime=120
   numjobs=4
   name=raw-randreadwrite
   rw=randrw

   [job1]
   filename=device name
   ```

2. Run the job using the following command:

   ```
   fio randomreadwrite.fio
   ```

Test sequential reads

For workloads that enable you to take advantage of sequential access patterns, such as database workloads, you can confirm performance for this pattern by testing sequential reads.

Run the following command to test sequential reads:

```
sudo fio --filename=device name --direct=1 --rw=read --bs=4k --ioengine=libaio --iodepth=256 --
runtime=120 --numjobs=4 --time_based --group_reporting --name=iops-test-job --eta-newline=1 --readonly
```

In some cases you may see more consistent results if you use a job file instead of running the command directly. Use the following instructions for this approach:

1. Create a job file, fioread.fio, with the following:

```
[global]
bs=4K
iodepth=256
direct=1
ioengine=libaio
group_reporting
time_based
runtime=120
numjobs=4
name=raw-read
rw=read

[job1]
filename=device name
```

2. Run the job using the following command:

```
fio read.fio
```

THROUGHPUT PERFORMANCE TESTS

Use the following FIO example commands to test throughput performance.

Test random reads

Run the following command to test random reads:

```
sudo fio --filename=device name --direct=1 --rw=randread --bs=64k --ioengine=libaio --iodepth=64 --
runtime=120 –numjobs=4 --time_based --group_reporting --name=throughput-test-job --eta-newline=1 --
readonly
```

In some cases you may see more consistent results if you use a job file instead of running the command directly. Use the following steps for this approach.

1. Create a job file, fiorandomread.fio, with the following:

```
[global]
bs=64K
iodepth=64
direct=1
ioengine=libaio
group_reporting
time_based
runtime=120
numjobs=4
name=raw-randread
rw=randread

[job1]
filename=device name
```

2. Run the job using the following command:

```
fio randomread.fio
```

Test file random read/writes

Run the following command against the mount point to test file read/writes:

```
sudo fio --filename=/custom mount point/file --size=500GB --direct=1 --rw=randrw --bs=64k --
ioengine=libaio --iodepth=64 --runtime=120 --numjobs=4 --time_based --group_reporting --name=throughput-
test-job --eta-newline=1
```

Add both the read MBPs and the write MBPs returned.

Test random read/writes

Warning

Do not run FIO tests with a write workload (`readwrite`, `randrw`, `write`, `trimwrite`) directly against a device

that is in use.

Run the following command to test random read/writes:

```
sudo fio --filename=device name --direct=1 --rw=randrw --bs=264k --ioengine=libaio --iodepth=64 --
runtime=120 --numjobs=4 --time_based --group_reporting --name=throughput-test-job --eta-newline=1
```

Add both the read MBPs and the write MBPs returned.

In some cases you may see more consistent results if you use a job file instead of running the command directly. Use the following steps for this approach.

1. Create a job file, fiorandomread.fio, with the following:

```
[global]
bs=264K
iodepth=64
direct=1
ioengine=libaio
group_reporting
time_based
runtime=120
numjobs=4
name=raw-randreadwrite
rw=randrw

[job1]
filename=device name
```

2. Run the job using the following command:

```
fio randomreadwrite.fio
```

Test sequential reads

For workloads that enable you to take advantage of sequential access patterns, such as database workloads, you can confirm performance for this pattern by testing sequential reads.

Run the following command to test sequential reads:

```
sudo fio --filename=device name --direct=1 --rw=read --bs=64k --ioengine=libaio --iodepth=64 --
runtime=120 —numjobs=4 --time_based --group_reporting --name=throughput-test-job --eta-newline=1 --
readonly
```

In some cases you may see more consistent results if you use a job file instead of running the command directly. Use the following steps for this approach.

1. Create a job file, fioread.fio, with the following:

   ```
   [global]
   bs=64K
   iodepth=64
   direct=1
   ioengine=libaio
   group_reporting
   time_based
   runtime=120
   numjobs=4
   name=raw-read
   rw=read

   [job1]
   filename=device name
   ```

2. Run the job using the following command:

   ```
   fio read.fio
   ```

Block Volume Metrics

You can monitor the health, capacity, and performance of your block volumes and boot volumes by using metrics, alarms, and notifications.

This topic describes the metrics emitted by the metric namespace `oci_blockstore` (the Block Volume service).

Resources: Block volumes and boot volumes.

Overview of Metrics for an Instance and Its Storage Devices

If you're not already familiar with the different types of metrics available for an instance and its storage and network devices, see Compute Metrics.

Available Metrics: oci_blockstore

The Block Volume service metrics help you measure volume operations and throughput related to Compute instances.

The metrics listed in the following table are automatically available for any block volume or boot volume, regardless of whether the attached instance has monitoring enabled. You do not need to enable monitoring on the volumes to get these metrics.

You also can use the Monitoring service to create custom queries.

Each metric includes the following dimensions:

ATTACHMENTID

The OCID of the volume attachment.

RESOURCEID

The OCID of the volume.

Metric	Metric Display Name	Unit	Description	Dimensions
`VolumeReadThroughput`*	**Volume Read Throughput**	bytes	Read throughput. Expressed as bytes read per interval.	`attachmentId` `resourceId`
`VolumeWriteThroughput`*	**Volume Write Throughput**	bytes	Write throughput. Expressed as bytes written per interval.	
`VolumeReadOps`*	**Volume Read Operations**	reads	Activity level from I/O reads. Expressed as reads per interval.	
`VolumeWriteOps`*	**Volume Write Operations**	writes	Activity level from I/O writes. Expressed as writes per interval.	

* The Compute service separately reports network-related metrics *as measured on the instance itself and aggregated across all the attached volumes*. Those metrics are available in the `oci_computeagent` metric namespace. For more information, see Compute Metrics.

Using the Console

To view default metric charts for a single volume

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. Click the instance to view its details.

3. Click either **Attached Block Volumes** or **Boot Volume** to view the volume you're interested in.
4. Click the volume to view its details.
5. Under **Resources**, click **Metrics**.

For more information about monitoring metrics and using alarms, see Monitoring Overview. For information about notifications for alarms, see Notifications Overview.

To view default metric charts for multiple volumes

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Monitoring** and click **Service Metrics**.
2. For **Compartment**, select the compartment that contains the volumes you're interested in.
3. For **Metric Namespace**, select **oci_blockstore**.
   The **Service Metrics** page dynamically updates the page to show charts for each metric that is emitted by the selected metric namespace.

For more information about monitoring metrics and using alarms, see Monitoring Overview. For information about notifications for alarms, see Notifications Overview.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following APIs for monitoring:

- Monitoring API for metrics and alarms
- Notifications API for notifications (used with alarms)

CHAPTER 6 Compute

This chapter explains how to launch, access, rename, and terminate compute instances.

Overview of the Compute Service

Oracle Cloud Infrastructure Compute lets you provision and manage compute hosts, known as instances. You can launch instances as needed to meet your compute and application requirements. After you launch an instance, you can access it securely from your computer, restart it, attach and detach volumes, and terminate it when you're done with it. Any changes made to the instance's local drives are lost when you terminate it. Any saved changes to volumes attached to the instance are retained.

Oracle Cloud Infrastructure offers both bare metal and virtual machine instances:

- **Bare Metal:** A bare metal compute instance gives you dedicated physical server access for highest performance and strong isolation.
- **Virtual Machine:** A virtual machine (VM) is an independent computing environment that runs on top of physical bare metal hardware. The virtualization makes it possible to run multiple VMs that are isolated from each other. VMs are ideal for running applications that do not require the performance and resources (CPU, memory, network bandwidth, storage) of an entire physical machine.

  An Oracle Cloud Infrastructure VM compute instance runs on the same hardware as a bare metal instance, leveraging the same cloud-optimized hardware, firmware, software stack, and networking infrastructure.

Be sure to review Best Practices for Your Compute Instance for important information about working with your Oracle Cloud Infrastructure Compute instance.

Oracle Cloud Infrastructure uses Oracle Ksplice to apply important security and other critical kernel updates to the hypervisor hosts without a reboot.

Instance Types

When you create a Compute instance, you can select the most appropriate type of instance for your applications based on characteristics such as the number of CPUs, amount of memory, and network resources. Oracle Cloud Infrastructure offers a variety of shapes that are designed to meet a range of compute and application requirements:

- **Standard shapes:** Designed for general purpose workloads and suitable for a wide range of applications and use cases. Standard shapes provide a balance of cores, memory, and network resources. Standard shapes are available with Intel or AMD processors.
- **DenseIO shapes:** Designed for large databases, big data workloads, and applications that require high-performance local storage. DenseIO shapes include locally-attached NVMe-based SSDs.
- **GPU shapes:** Designed for hardware-accelerated workloads. GPU shapes include Intel CPUs and NVIDIA graphics processors.
- **High performance computing (HPC) shapes:** Designed for high-performance computing workloads that require high frequency processor cores and cluster networking for massively parallel HPC workloads. HPC shapes are available for bare metal instances only.

For more information about the available bare metal and VM shapes, see Compute Shapes, Bare Metal Instance Types, Virtual Machine Shapes, and Accelerated GPU Instance Types.

Components for Launching Instances

The components required to launch an instance are:

AVAILABILITY DOMAIN

The Oracle Cloud Infrastructure data center within your geographical region that hosts cloud resources, including your instances. You can place instances in the same or different availability domains, depending on your performance and redundancy requirements. For more information, see Regions and Availability Domains.

VIRTUAL CLOUD NETWORK

A virtual version of a traditional network—including subnets, route tables, and gateways—on which your instance runs. At least one cloud network has to be set up before you launch instances. For information about setting up cloud networks, see Overview of Networking.

KEY PAIR (FOR LINUX INSTANCES)

A security mechanism required for Secure Shell (SSH) access to an instance. Before you launch an instance, you'll need at least one key pair. For more information, see Managing Key Pairs on Linux Instances.

TAGS

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

PASSWORD (FOR WINDOWS INSTANCES)

A security mechanism required to access an instance that uses an Oracle-provided Windows image. The first time you launch an instance using a Windows image, Oracle Cloud Infrastructure will generate an initial, one-time password that you can retrieve using the console or API. This password must be changed after you initially log on.

IMAGE

A template of a virtual hard drive that determines the operating system and other software for an instance. For details about Oracle Cloud Infrastructure platform images, see Oracle-Provided Images. You can also launch instances from:

- Images published by Oracle partners from the Partner Image catalog.
- Pre-built Oracle enterprise images and solutions enabled for Oracle Cloud Infrastructure
- Custom images, including bring your own image scenarios.
- Boot Volumes.

SHAPE

A template that determines the number of CPUs, amount of memory, and other resources allocated to a newly created instance. You choose the most appropriate shape when you launch an instance. See Compute Shapes for a list of available bare metal and VM shapes.

You can optionally attach volumes to an instance. For more information, see Overview of Block Volume.

Resource Identifiers

Most types of Oracle Cloud Infrastructure resources have a unique, Oracle-assigned identifier called an Oracle Cloud ID (OCID). For information about the OCID format and other ways to identify your resources, see Resource Identifiers.

Ways to Access Oracle Cloud Infrastructure

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see Software Development Kits and Command Line Interface.

To access the Console, you must use a supported browser. Oracle Cloud Infrastructure supports the latest desktop versions of Google Chrome, Microsoft Edge, Internet Explorer 11, Safari, Firefox, and Firefox ESR. Note that private browsing mode is not supported for Firefox, Internet Explorer, or Edge. Mobile browsers are not supported.

For general information about using the API, see REST APIs.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For

example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Limits on Compute Resources

See Service Limits for a list of applicable limits and instructions for requesting a limit increase.

Additional limits include:

- To attach a volume to an instance, both the instance and volume must be within the same availability domain.
- Many Compute operations are subject to throttling.

Metadata Key Limits

Custom metadata keys (any key you define that is not `ssh_authorized_keys` or `user_data`) have the following limits:

- Max number of metadata keys: 128
- Max size of key name: 255 characters
- Max size of key value: 255 characters

`ssh_authorized_keys` is a special key that does not have these limits, but its value is validated to conform to a public key in the OpenSSH format.

`user_data` has a maximum size of 16KB. For Linux instances with cloud-init configured, you can populate the `user_data` field with a Base64-encoded string of cloud-init user data. For

more information on formats that cloud-init accepts, see cloud-init formats. On Windows instances, the `user_data` field can be provided but isn't used by Oracle-provided images.

Best Practices for Your Compute Instance

Oracle Cloud Infrastructure Compute provides bare metal compute capacity that delivers performance, flexibility, and control without compromise. It is powered by Oracle's next generation, internet-scale infrastructure designed to help you develop and run your most demanding applications and workloads in the cloud.

You can provision compute capacity through an easy-to-use web console or an API. The bare metal compute instance, once provisioned, provides you with access to the host. This gives you complete control of your instance.

While you have full management authority for your instance, Oracle recommends a variety of best practices to ensure system availability and top performance.

IP Addresses Reserved for Use by Oracle

Certain IP addresses are reserved for Oracle Cloud Infrastructure use and may not be used in your address numbering scheme.

169.254.0.0/16

These addresses are used for iSCSI connections to the boot and block volumes, instance metadata, and other services.

Three IP Addresses in Each Subnet

These addresses consist of:

- The first IP address in the CIDR (the network address)
- The last IP address in the CIDR (the broadcast address)
- The first host address in the CIDR (the subnet default gateway address)

For example, in a subnet with CIDR 192.168.0.0/24, these addresses are reserved:

- 192.168.0.0 (the network address)
- 192.168.0.255 (the broadcast address)
- 192.168.0.1 (the subnet default gateway address)

The remaining addresses in the CIDR (192.168.0.2 to 192.168.0.254) are available for use.

Essential Firewall Rules

Warning

Windows 2008 Server R2 images do not support restricting certain firewall rules for local principals, such as "Administrators", so any authenticated user on an instance can make outgoing connections to the iSCSI network endpoints (169.254.0.2:3260, 169.254.2.0/24:3260) that serve the instance's boot and block volumes.

All Oracle-provided images include rules that allow only "root" on Linux instances or "Administrators" on Windows Server 2012 R2 and Windows Server 2016 instances to make outgoing connections to the iSCSI network endpoints (169.254.0.2:3260, 169.254.2.0/24:3260) that serve the instance's boot and block volumes.

- Oracle recommends that you do not reconfigure the firewall on your instance to remove these rules. Removing these rules allows non-root users or non-administrators to access the instance’s boot disk volume.
- Oracle recommends that you do not create custom images without these rules unless you understand the security risks.
- Running Uncomplicated Firewall (UFW) on Ubuntu images may cause issues with these rules, so Oracle recommends that you do not enable UFW on your instances. See Ubuntu Instance fails to reboot after enabling Uncomplicated Firewall (UFW) for more information.

System Resilience

Oracle Cloud Infrastructure runs on Oracle's high-quality Sun servers. However, any hardware can experience a failure. Follow industry-wide hardware failure best practices to ensure the resilience of your solution. Some best practices include:

- Design your system with redundant compute nodes in different availability domains to support fail-over capability.
- Create a custom image of your system drive each time you change the image.
- Back up your data drives, or sync to spare drives, regularly.

If you experience a hardware failure and have followed these practices, you can terminate the failed instance, launch your custom image to create a new instance, and then apply the backup data.

Uninterrupted Access to the Instance

Make sure to keep the DHCP client running so you can always access the instance. If you stop the DHCP client manually or disable NetworkManager (which stops the DHCP client on Linux

instances), the instance can't renew its DHCP lease and will become inaccessible when the lease expires (typically within 24 hours). Do not disable NetworkManager unless you use another method to ensure renewal of the lease.

Stopping the DHCP client might remove the host route table when the lease expires. Also, loss of network connectivity to your iSCSI connections might result in loss of the boot drive.

User Access

If you created your instance using an Oracle-provided Linux image, you can use SSH to access your instance from a remote host as the `opc` user. After logging in, you can add users on your instance.

If you do not want to share SSH keys, you can create additional SSH-enabled users.

If you created your instance using an Oracle-provided Windows image, you can access your instance using a Remote Desktop client as the `opc` user. After logging in, you can add users on your instance.

For more information about user access, see Adding Users on an Instance.

NTP Service

Oracle Cloud Infrastructure offers a fully managed, secure, and highly available NTP service that you can use to set the date and time of your Compute and Database instances from within your virtual cloud network (VCN). Oracle recommends that you configure your instances to use the Oracle Cloud Infrastructure NTP service. For information about how to configure instances to use this service, see Configuring the Oracle Cloud Infrastructure NTP Service for an Instance.

Fault Domains

A fault domain is a grouping of hardware and infrastructure that is distinct from other fault domains in the same availability domain. Each availability domain has three fault domains. By properly leveraging fault domains you can increase the availability of applications running on Oracle Cloud Infrastructure. See Fault Domains for more information.

Your application's architecture will determine whether you should separate or group instances using fault domains.

Scenario 1: Highly Available Application Architecture

In this scenario you have a highly available application, for example you have two web servers and a clustered database. In this scenario you should group one web server and one database node in one fault domain and the other half of each pair in another fault domain. This ensures that a failure of any one fault domain does not result in an outage for your application.

Scenario 2: Single Web Server and Database Instance Architecture

In this scenario your application architecture is not highly available, for example you have one web server and one database instance. In this scenario both the web server and the database instance must be placed in the same fault domain. This ensures that your application will only be impacted by the failure of that single fault domain.

Customer-Managed Virtual Machine (VM) Maintenance

Today when an underlying infrastructure component needs to undergo maintenance, we notify you in advance of the planned maintenance downtime. To avoid this planned downtime, you have the options to reboot, or stop and restart your instances prior to the scheduled maintenance. This makes it easy for you to control your instance downtime during the notification period. The reboot, or stop and restart of a VM instance during the notification period is different than a normal reboot. The reboot, or stop and start workflow will stop your instance on the existing VM host which needs maintenance and restarts it on a healthy VM host. If you choose not to reboot during the notification period, then Oracle Cloud Infrastructure will reboot your VM Instance before proceeding with the planned infrastructure maintenance. Customer-managed VM maintenance is currently supported only on standard instance shapes running Linux-based operating systems. This includes Oracle-provided platform images or custom images imported from outside of Oracle Cloud Infrastructure. For information on rebooting or restarting your instance prior to planned maintenance, see Stopping and Starting an Instance.

Configuring the Oracle Cloud Infrastructure NTP Service for an Instance

Oracle Cloud Infrastructure offers a fully managed, secure, and highly available NTP service that you can use to set the date and time of your Compute and Database instances from within your virtual cloud network (VCN). The Oracle Cloud Infrastructure NTP service uses redundant Stratum 1 devices in every availability domain. The Stratum 1 devices are synchronized to dedicated Stratum 2 devices that every host synchronizes against. The service is available in every region.

This topic describes how to configure your Compute instances to use this NTP service.

You can also choose to configure your instances to use a public NTP service or use FastConnect to leverage an on-premises NTP service.

Oracle Linux 6.x

Use the following steps to configure your Oracle Linux 6.x instances to use the Oracle Cloud Infrastructure NTP service.

1. Configure IPtables to allow connections to the Oracle Cloud Infrastructure NTP service, using the following commands:

   ```
   sudo iptables -I BareMetalInstanceServices 8 -d 169.254.169.254/32 -p udp -m udp --dport 123 -m comment --comment "Allow access to OCI local NTP service" -j ACCEPT
   ```

   ```
   sudo service iptables save
   ```

2. Install the NTP service with the following command:

   ```
   sudo yum install ntp
   ```

3. Set the date of your instance with the following command:

   ```
   sudo ntpdate 169.254.169.254
   ```

4. Configure the instance to use the Oracle Cloud Infrastructure NTP service for iburst. To configure, modify the `/etc/ntp.conf` file as follows:

a. In the `server` section, comment out the lines specifying the RHEL servers:

```
#server 0.rhel.pool.ntp.org iburst
#server 1.rhel.pool.ntp.org iburst
#server 2.rhel.pool.ntp.org iburst
#server 3.rhel.pool.ntp.org iburst
```

b. Add an entry for the Oracle Cloud Infrastructure NTP server:

```
server 169.254.169.254 iburst
```

The modified `server` section now contains the following:

```
# Please consider joining the pool (http://www.pool.ntp.org/join.html).
#server 0.rhel.pool.ntp.org iburst
#server 1.rhel.pool.ntp.org iburst
#server 2.rhel.pool.ntp.org iburst
#server 3.rhel.pool.ntp.org iburst
server 169.254.169.254 iburst
```

5. Set the NTP service to launch automatically when the instance boots with the following command:

```
sudo chkconfig ntpd on
```

6. Start the NTP service with the following command:

```
sudo /etc/init.d/ntpd start
```

7. Confirm that the NTP service is configured correctly with the following command:

```
ntpq -p
```

The output will be similar to the following:

```
remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
169.254.169.254 192.168.32.3     2 u    2   64    1    0.338    0.278   0.187
```

Oracle Linux 7.x

Note

Oracle-provided Oracle 7.x and CentOS 7.x images released after February 2018 include the Chrony service by default, so you do not need to configure the Oracle Cloud Infrastructure NTP service for these instances.

Use the following steps to configure your Oracle Linux 7.x instances to use the Oracle Cloud Infrastructure NTP service.

1. Run commands in this section as root with the following command:

   ```
   sudo su -
   ```

2. Install the NTP service with the following command:

   ```
   yum -y install ntp
   ```

3. Change the firewall rules to allow inbound and outbound traffic with the Oracle Cloud Infrastructure NTP server, at 169.254.169.254, on UDP port 123 with the following command:

   ```
   awk -v n=13 -v s=' <passthrough ipv="ipv4">-A OUTPUT -d 169.254.169.254/32 -p udp -m udp --dport
   123 -m comment --comment "Allow access to OCI local NTP service" -j ACCEPT </passthrough>' 'NR ==
   n {print s} {print}' /etc/firewalld/direct.xml > tmp && mv tmp /etc/firewalld/direct.xml
   ```

   At the prompt:

   ```
   mv: overwrite '/etc/firewalld/direct.xml'?
   ```

   enter `y`

4. Restart the firewall with the following command:

   ```
   service firewalld restart
   ```

5. Set the date of your instance with the following command:

```
ntpdate 169.254.169.254
```

6. Configure the instance to use the Oracle Cloud Infrastructure NTP service for iburst. To configure, modify the `/etc/ntp.conf` file as follows:
   a. In the `server` section comment out the lines specifying the RHEL servers:

      ```
      #server 0.rhel.pool.ntp.org iburst
      #server 1.rhel.pool.ntp.org iburst
      #server 2.rhel.pool.ntp.org iburst
      #server 3.rhel.pool.ntp.org iburst
      ```

   b. Add an entry for the Oracle Cloud Infrastructure NTP service:

      ```
      server 169.254.169.254 iburst
      ```

   The modified `server` section should now contain the following:

   ```
   # Please consider joining the pool (http://www.pool.ntp.org/join.html).
   #server 0.rhel.pool.ntp.org iburst
   #server 1.rhel.pool.ntp.org iburst
   #server 2.rhel.pool.ntp.org iburst
   #server 3.rhel.pool.ntp.org iburst
   server 169.254.169.254 iburst
   ```

7. Start and enable the NTP service with the following commands:

   ```
   systemctl start ntpd
   systemctl enable ntpd
   ```

   You also need disable the chrony NTP client to ensure that the NTP service starts automatically after a reboot, using the following commands:

   ```
   systemctl stop chronyd
   systemctl disable chronyd
   ```

8. Confirm that the NTP service is configured correctly with the following command:

   ```
   ntpq -p
   ```

   The output will be similar to the following:

   ```
        remote           refid      st t when poll reach   delay   offset  jitter
   ==============================================================================
   ```

```
169.254.169.254 192.168.32.3     2 u    2   64    1    0.338    0.278   0.187
```

Windows Server 2016, Windows Server 2012 R2 and Windows Server 2008 R2

You can configure your Windows Server instances to use the Oracle Cloud Infrastructure NTP service by running the following commands in Windows Powershell as Administrator.

Windows 2012 and Windows 2016:

```
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\Parameters' -Name 'Type' -Value
NTP -Type String
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\Config' -Name 'AnnounceFlags' -
Value 5 -Type DWord
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\TimeProviders\NtpServer' -Name
'Enabled' -Value 1 -Type DWord
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\Parameters' -Name 'NtpServer' -
Value '169.254.169.254,0x9' -Type String
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\TimeProviders\NtpClient' -Name
'SpecialPollInterval' -Value 900 -Type DWord
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\Config' -Name
'MaxPosPhaseCorrection' -Value 1800 -Type DWord
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\Config' -Name
'MaxNegPhaseCorrection' -Value 1800 -Type DWord
```

Windows 2008:

```
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\Parameters' -Name 'Type' -Value
NTP -Type String
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\Config' -Name 'AnnounceFlags' -
Value 5 -Type DWord
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\TimeProviders\NtpServer' -Name
'Enabled' -Value 1 -Type DWord
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\Parameters' -Name 'NtpServer' -
Value '169.254.169.254,0x9' -Type String
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\TimeProviders\NtpClient' -Name
'SpecialPollInterval' -Value 900 -Type DWord
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\Config' -Name
'MaxPosPhaseCorrection' -Value 1800 -Type DWord
Set-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Services\W32Time\Config' -Name
'MaxNegPhaseCorrection' -Value 1800 -Type DWord
```

```
Set-ItemProperty -Path 'HKLM:\SOFTWARE\Microsoft\Windows\CurrentVersion\DateTime\Servers' -Name 0 -Value
"169.254.169.254"
Set-ItemProperty -Path 'HKLM:\SOFTWARE\Microsoft\Windows\CurrentVersion\DateTime\Servers' -Name "
(Default)" -Value "0"
```

Steps 1 - 7 below walk you though these registry changes, you can use these steps to manually edit the registry instead of using PowerShell. If you use the PowerShell commands, you can skip steps 1 - 7, and proceed with steps 8 and 9 to complete the process of configuring your Windows instance to use the Oracle Cloud Infrastructure NTP service.

1. Change the server type to NTP:
    a. From Registry Editor, navigate to:

    ```
    HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\W32Time\Parameters\
    ```

    b. Click **Type**.
    c. Change the value to `NTP` and click **OK**.
2. Configure the Windows Time service to enable the `Timeserv_Announce_Yes` and `Reliable_Timeserv_Announce_Auto` flags.
   To configure, set the `AnnounceFlags` parameter to 5:
    a. From Registry Editor, navigate to:

    ```
    HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\W32Time\Config\
    ```

    b. Click **AnnounceFlags**.
    c. Change the value to `5` and click **OK**.
3. Enable the NTP server:
    a. From Registry Editor, navigate to:

    ```
    HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\W32Time\TimeProviders\NtpServer\
    ```

    b. Click **Enabled**.
    c. Change the value to `1` and click **OK**.
4. Set the time sources:

a. From Registry Editor, navigate to:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\W32Time\Parameters\
```

b. Click **NtpServer**.

c. Change the value to `169.254.169.254,0x9` and click **OK**.

5. Set the poll interval:

a. From Registry Editor, navigate to:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\W32Time\TimeProviders\NtpClient\
```

b. Click **SpecialPollInterval**.

c. Set the value to the interval that you want the time service to synchronize on. The value is in seconds. To set it for 15 minutes, set the value to `900`, and click **OK**.

6. Set the phase correction limit settings to restrict the time sample boundaries:

a. From Registry Editor, navigate to:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\W32Time\Config\
```

b. Click **MaxPosPhaseCorrection**.

c. Set the value to the maximum time offset in the future for time samples. The value is in seconds. To set it for 30 minutes, set the value to `1800` and click **OK**.

d. Click **MaxNegPhaseCorrection**.

e. Set the value to the maximum time offset in the past for time samples. The value is in seconds. To set it for 30 minutes, set the value to `1800` and click **OK**.

7. For Windows 2008 only, you need to add the Oracle NTP service to the list of available servers and then configure the Oracle NTP service to be the active server:

a. From Registry Editor, navigate to:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\DateTime\Servers\
```

b. Right-click **Servers**, and select **New**, **String Value**.

c. Set the **Name** to `0`.

d. Set the **Value data** to `169.254.169.254`.

e. In the same path, find the string value named `(Default)` and double-click it to open the **Edit String** dialog.

f. Set the **Value data** to `0` and click **OK**.

8. Restart the time service by running the following command from a command prompt:

```
net stop w32time && net start w32time
```

9. Test the connection to the NTP service by running the following command from a command prompt:

```
w32tm /query /peers
```

The output will be similar to the following:

```
#Peer: 1

Peer: 169.254.169.254,0x9
State: Active
Time Remaining: 22.1901786s
Mode: 3 (Client)
Stratum: 0 (unspecified)
PeerPoll Interval: 10 (1024s)
HostPoll Interval: 10 (1024s)
```

After the time specified in the poll interval has elapsed, `State` will change from `Pending` to `Active`.

Protecting Data on NVMe Devices

Some instance shapes in Oracle Cloud Infrastructure include locally attached NVMe devices. These devices provide extremely low latency, high performance block storage that is ideal for big data, OLTP, and any other workload that can benefit from high-performance block storage.

Note that these devices are not protected in any way; they are individual devices locally installed on your instance. Oracle Cloud Infrastructure does not take images, back up, or use RAID or any other methods to protect the data on NVMe devices. It is your responsibility to protect and manage the durability the data on these devices.

Oracle Cloud Infrastructure offers high-performance remote block (iSCSI) LUNs that are redundant and can be backed up using an API call. See Overview of Block Volume for more information.

See Compute Shapes for information about which instance types support local NVMe storage.

Finding the NVMe devices on your instance

You can identify the NVMe devices by using the `lsblk` command. The response returns a list. NVMe devices begin with "`nvme`", as shown in the following example for a BM.DenseIO1.36 instance:

```
[opc@somehost ~]$ lsblk
NAME    MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
sda       8:0    0 46.6G  0 disk
├─sda1    8:1    0  512M  0 part /boot/efi
├─sda2    8:2    0    8G  0 part [SWAP]

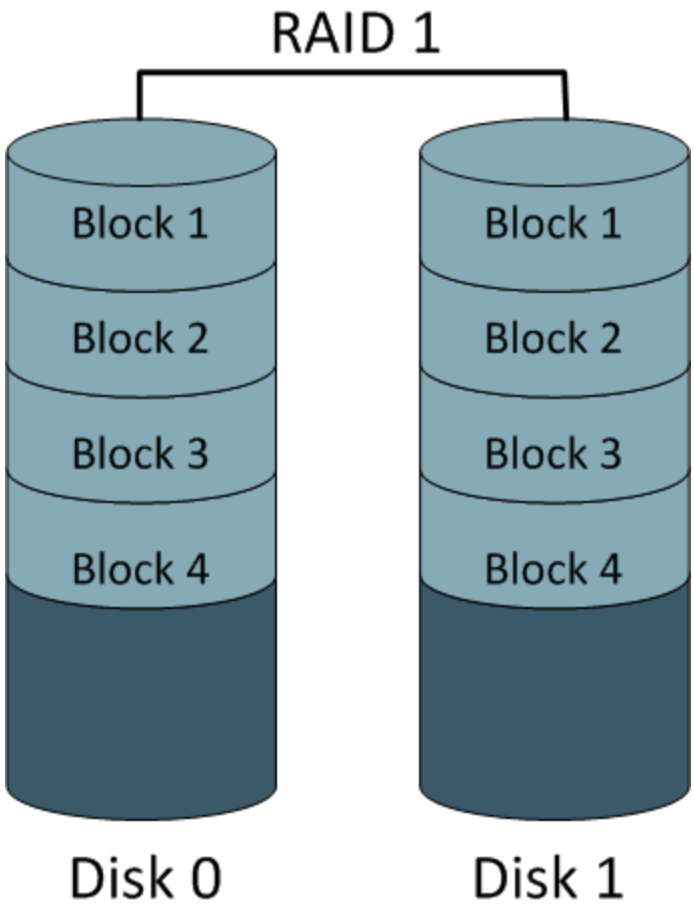
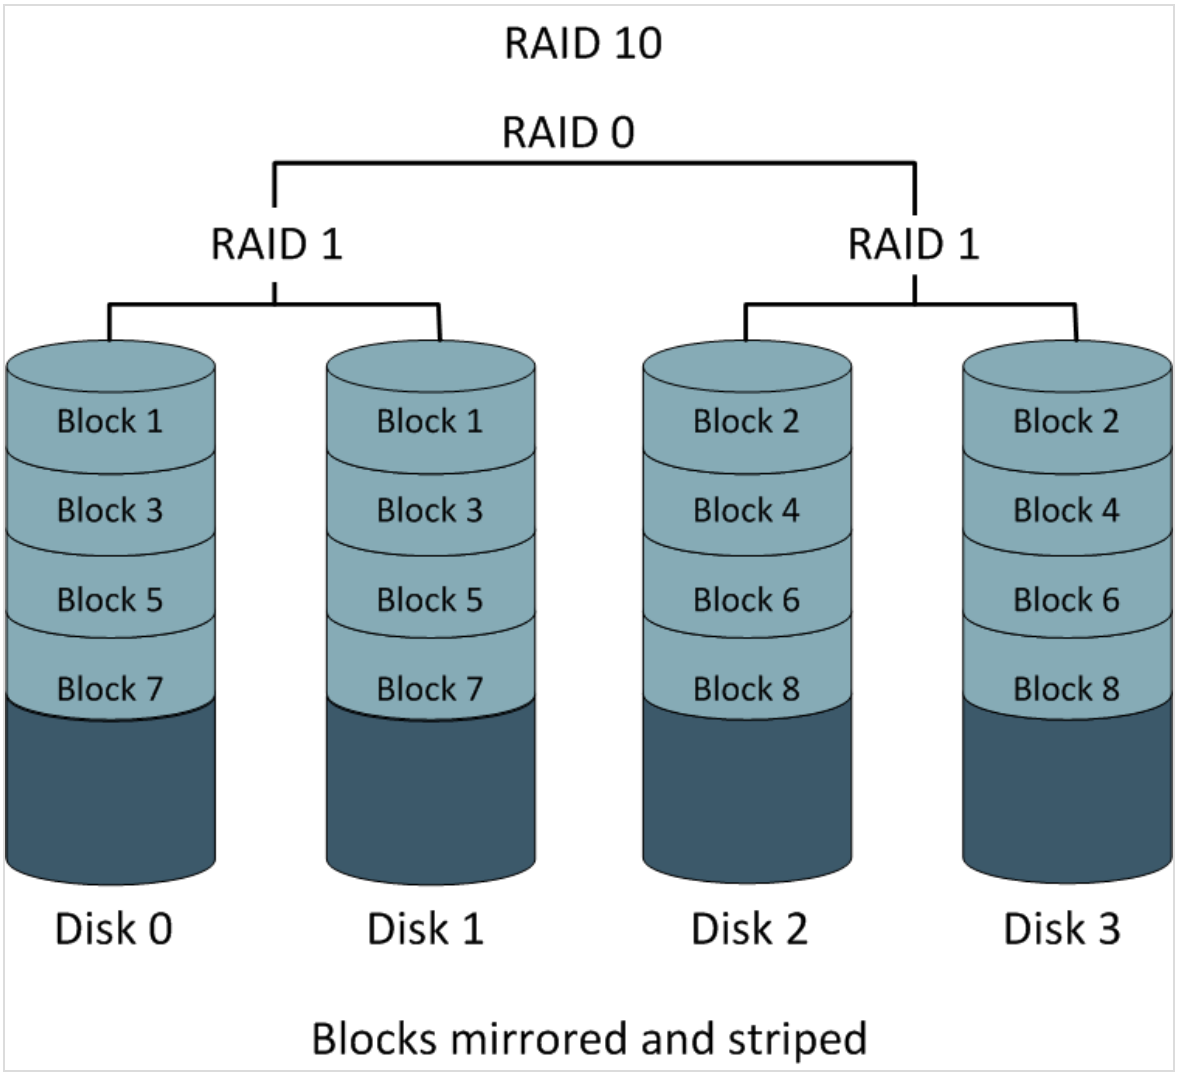
```

Failure Modes and How to Protect Against Them



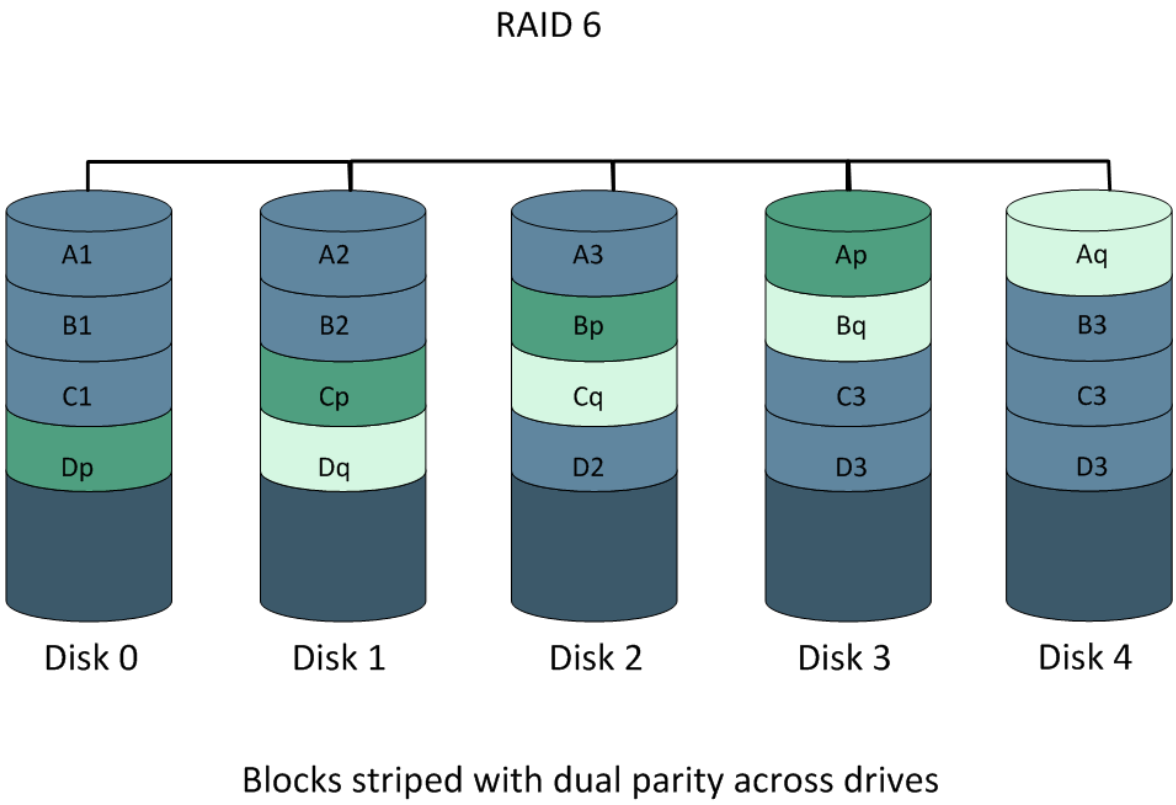
There are three primary failure modes you should plan for:

- Protecting against the failure of an NVMe device
- Protecting Against the Loss of the Instance or Availability Domain
- Protecting Against Data Corruption or Loss from Application or User Error



Protecting against the failure of an NVMe device

A protected RAID array is the most recommended way to protect against an NVMe device failure. There are three RAID levels that can be used for the majority of workloads:



- RAID 1: An exact copy (or mirror) of a set of data on two or more disks; a classic RAID 1 mirrored pair contains two disks, as shown:

- RAID 10: Stripes data across multiple mirrored pairs. As long as one disk in each mirrored pair is functional, data can be retrieved, as shown:

- RAID 6: Block-level striping with two parity blocks distributed across all member disks, as shown.

For more information about RAID and RAID levels, see RAID.

Because the appropriate RAID level is a function of the number of available drives, the number of individual LUNs needed, the amount of space needed, and the performance requirements, there isn't one correct choice. You must understand your workload and design accordingly.

Options for Using a BM.DenseIO1.36 Shape

There are several options for BM.DenseIO1.36 instances with nine NVMe devices:

Create a single RAID 6 device across all nine devices. This array is redundant, performs well, will survive the failure of any two devices, and will be exposed as a single LUN with about 23.8TB of usable space.

Use the following commands to create a single RAID 6 device across all nine devices:

```
$ sudo yum install mdadm -y
```

```
$ sudo mdadm --create /dev/md0 --raid-devices=9 --level=6 /dev/nvme0n1 /dev/nvme1n1 /dev/nvme2n1
/dev/nvme3n1 /dev/nvme4n1 /dev/nvme5n1 /dev/nvme6n1 /dev/nvme7n1 /dev/nvme8n1
```

```
$ sudo mdadm --detail --scan | sudo tee -a /etc/mdadm.conf >> /dev/null
```

Create a four device RAID 10 and a five device RAID 6 array. These arrays would be exposed as two different LUNs to your applications. This is a recommended choice when you need to isolate one type of I/O from another, such as log and data files. In this example, your RAID 10 array would have about 6.4TB of usable space and the RAID 6 array would have about 9.6TB of usable space.

Use the following commands to create a four-device RAID 10 and a five-device RAID 6 array:

```
$ sudo yum install mdadm -y
```

```
$ sudo mdadm --create /dev/md0 --raid-devices=4 --level=10 /dev/nvme5n1 /dev/nvme6n1 /dev/nvme7n1
/dev/nvme8n1
```

```
$ sudo mdadm --create /dev/md1 --raid-devices=5 --level=6 /dev/nvme0n1 /dev/nvme1n1 /dev/nvme2n1
/dev/nvme3n1 /dev/nvme4n1
```

```
$ sudo mdadm --detail --scan | sudo tee -a /etc/mdadm.conf >> /dev/null
```

If you need the best possible performance and can sacrifice some of your available space, then an eight-device RAID 10 array is an option. Because RAID 10 requires an even number of devices, the ninth device is left out of the array and serves as a hot spare in case another device fails. This creates a single LUN with about 12.8 TB of usable space.

Use the following commands to create an eight-device RAID 10 array:

```
$ sudo yum install mdadm -y
```

```
$ sudo mdadm --create /dev/md0 --raid-devices=8 --level=10 /dev/nvme0n1 /dev/nvme1n1 /dev/nvme2n1
/dev/nvme3n1 /dev/nvme4n1 /dev/nvme5n1 /dev/nvme6n1 /dev/nvme7n1
```

The following command adds /dev/nvme8n as a hot spare for the /dev/md0 array:

```
$ sudo mdadm /dev/md0 --add /dev/nvme8n1
```

```
$ sudo mdadm --detail --scan | sudo tee -a /etc/mdadm.conf >> /dev/null
```

For the best possible performance and I/O isolation across LUNs, create two four-device RAID 10 arrays. Because RAID 10 requires an even number of devices, the ninth device is left out of the arrays and serves as a global hot spare in case another device in either array fails. This creates two LUNS, each with about 6.4 TB of usable space.

Use the following commands to create two four-device RAID 10 arrays with a global hot spare:

```
$ sudo yum install mdadm -y
```

```
$ sudo mdadm --create /dev/md0 --raid-devices=4 --level=10 /dev/nvme4n1 /dev/nvme5n1 /dev/nvme6n1
/dev/nvme7n1
```

```
$ sudo mdadm --create /dev/md1 --raid-devices=4 --level=10 /dev/nvme0n1 /dev/nvme1n1 /dev/nvme2n1
/dev/nvme3n1
```

Creating a global hot spare requires the following two steps:

1. Add the spare to either array (it does not matter which one) by running these commands:

   ```
   $ sudo mdadm /dev/md0 --add /dev/nvme8n1
   ```

   ```
   $ sudo mdadm --detail --scan | sudo tee -a /etc/mdadm.conf >> /dev/null
   ```

2. Edit `/etc/mdadm` to put both arrays in the same spare-group. Add `spare-group=global` to the end of the line that starts with `ARRAY`, as follows:

   ```
   $ sudo vi /etc/mdadm.conf
   ```

   ```
   ARRAY /dev/md0 metadata=1.2 spares=1 name=mdadm.localdomain:0
   UUID=43f93ce6:4a19d07b:51762f1b:250e2327 spare-group=global
   ```

   ```
   ARRAY /dev/md1 metadata=1.2 name=mdadm.localdomain:1 UUID=7521e51a:83999f00:99459a19:0c836693
   spare-group=global
   ```

Monitoring Your Array

It's important for you to be notified if a device in one of your arrays fails. Mdadm has built-in tools that can be utilized for monitoring, and there are two options you can use:

- Set the `MAILADDR` option in `/etc/mdadm.conf` and then run the `mdadm` monitor as a daemon

- Run an external script when `mdadm` detects a failure

SET THE MAILADDR OPTION IN /ETC/MDADM.CONF AND RUN THE MDADM MONITOR AS A DAEMON

The simplest method is to set the `MAILADDR` option in `/etc/mdadm.conf`, and then run the mdadm monitor as a daemon, as follows:

1. The `DEVICE partitions` line is required for `MAILADDR` to work; if it is missing, you must add it, as follows:

   ```
   $ sudo vi /etc/mdadm.conf

   DEVICE partitions

   ARRAY /dev/md0 level=raid1 UUID=1b70e34a:2930b5a6:016we78d:eese14532

   MAILADDR <my.name@oracle.com>
   ```

2. Run the monitor using the following command:

   ```
   $ sudo nohup mdadm --monitor --scan --daemonize &
   ```

3. To verify that the monitor runs at startup, run the following commands:

   ```
   $ sudo chmod +x /etc/rc.d/rc.local

   $ sudo vi /etc/rc.local
   ```

   Add the following line to the end of /etc/rc.local:

   ```
   nohup mdadm --monitor --scan --daemonize &
   ```

4. To verify that the email and monitor are both working run the following command:

   ```
   $ sudo mdadm --monitor --scan --test -1
   ```

   Note that these emails will likely be marked as spam. The `PROGRAM` option, described later in this topic, allows for more sophisticated alerting and messaging.

RUN AN EXTERNAL SCRIPT WHEN A FAILURE IS DETECTED

A more advanced option is to create an external script that would run if the `mdadm` monitor detects a failure. You would integrate this type of script with your existing monitoring solution. The following is an example of this type of script:

```
$ sudo vi /etc/mdadm.events
```

```
#!/bin/bash
event=$1
device=$2
if [ $event == "Fail" ]
then
  <"do something">
else
 if [ $event == "FailSpare" ]
 then
  <"do something else">
 else
  if [ $event == "DegradedArray" ]
  then
   <"do something else else">
  else
   if [ $event == "TestMessage" ]
    then
    <"do something else else else">
   fi
  fi
 fi
fi

$ sudo chmod +x /etc/mdadm.events
```

Next, add the `PROGRAM` option to `/etc/mdadm.conf`, as shown in the following example:

1. The `DEVICE partitions` line is required for `MAILADDR` to work; if it is missing, you must add it, as follows:

   ```
   $ sudo vi /etc/mdadm.conf
   ```

   ```
   DEVICE partitions
   ```

   ```
   ARRAY /dev/md0 level=raid1 UUID=1b70e34a:2930b5a6:016we78d:eese14532
   ```

   ```
   MAILADDR <my.name@oracle.com>
   ```

   ```
   PROGRAM /etc/mdadm.events
   ```

2. Run the monitor using the following command:

   ```
   $ sudo nohup mdadm --monitor --scan --daemonize &
   ```

3. To verify that the monitor runs at startup, run the following commands:

```
$ sudo chmod +x /etc/rc.d/rc.local
```

```
$ sudo vi /etc/rc.local
```

Add the following line to the end of /etc/rc.local:

```
nohup mdadm --monitor --scan --daemonize &
```

4. To verify that the email and monitor are both working run the following command:

```
$ sudo mdadm --monitor --scan --test -1
```

Note that these emails will likely be marked as spam. The `PROGRAM` option, described later in this topic, allows for more sophisticated alerting and messaging.

SIMULATE THE FAILURE OF A DEVICE

You can use `mdadm` to manually cause a failure of a device to see whether your RAID array can survive the failure, as well as test the alerts you have set up.

1. Mark a device in the array as failed by running the following command:

```
$ sudo mdadm /dev/md0 --fail /dev/nvme0n1
```

2. Recover the device or your array might not be protected. Use the following command:

```
$ sudo mdadm /dev/md0 --add /dev/nvme0n1
```

Your array will automatically rebuild in order to use the "new" device. Performance will be decreased during this process.

3. You can monitor the rebuild status by running the following command:

```
$ sudo mdadm --detail /dev/md0
```

What To Do When an NVMe Device Fails

Compute resources in the cloud are designed to be temporary and fungible. If an NVMe device fails while the instance is in service, you should start another instance with the same amount of storage or more, and then copy the data onto the new instance, replacing the old instance. There are multiple toolsets for copying large amounts of data, with rsync being the most popular. Since the connectivity between instances is a full 10Gb/sec, copying data should be quick. Remember that with a failed device, your array may no longer be protected, so you should copy the data off of the impacted instance as quickly as possible.

Using the Linux Logical Volume Manager

The Linux Logical Volume Manager (LVM) provides a rich set of features for managing volumes. If you need these features, we strongly recommend that you use `mdadm` as described in preceding sections of this topic to create the RAID arrays, and then use LVM's `pvcreate`, `vgcreate`, and `lvcreate` commands to create volumes on the `mdadm` LUNs. You should not use LVM directly against your NVMe devices.

Protecting Against the Loss of the Instance or Availability Domain

Once your data is protected against the loss of a NVMe device, you need to protect it against the loss of an instance or the loss of the availability domain. This type of protection is typically done by replicating your data to another availability domain or backing up your data to another location. The method you choose depends on your objectives. For details, see Recovery Time Objective (RTO) and Recovery Point Objective (RPO).

Replication

Replicating your data from one instance in one availability domain to another has the lowest RTO and RPO at a significantly higher cost than backups; for every instance in one availability domain, you must have another instance in a different availability domain.

For Oracle database workloads, you should use the built-in Oracle Data Guard functionality to replicate your databases. Oracle Cloud Infrastructure availability domains are each close enough to each other to support high performance, synchronous replication. Asynchronous replication is also an option.

For general-purpose block replication, DRBD is the recommended option. You can configure DRBD to replicate, synchronously or asynchronously, every write in one availability domain to another availability domain.

Backups

Traditional backups are another way to protect data. All commercial backup products are fully supported on Oracle Cloud Infrastructure. If you use backups, the RTO and RPO are significantly higher than using replication because you must recreate the compute resources that failed and then restore the most recent backup. Costs are significantly lower because you

don't need to maintain a second instance. Do not store your backups in the same availability domain as their original instance.

Protecting Against Data Corruption or Loss from Application or User Error

The two recommended ways of protecting against data corruption or loss from application or user error are regularly taking snapshots or creating backups.

SNAPSHOTS

The two easiest ways to maintain snapshots are to either use a file system that supports snapshots, such as ZFS, or use LVM to create and manage the snapshots. Because of the way LVM has implemented copy-on-write (COW), performance may significantly decrease when a snapshot is taken using LVM.

BACKUPS

All commercial backup products are fully supported on Oracle Cloud Infrastructure. Make sure that your backups are not stored in the same availability domain as their original instance.

Boot Volumes

When you launch a virtual machine (VM) or bare metal instance based on an Oracle-provided image or custom image, a new boot volume for the instance is created in the same compartment. That boot volume is associated with that instance until you terminate the instance. When you terminate the instance, you can preserve the boot volume and its data. For more information, see Terminating an Instance. This feature gives you more control and management options for your compute instance boot volumes, and enables:

- **Instance scaling:** When you terminate your instance, you can keep the associated boot volume and use it to launch a new instance using a different instance type or shape. See Creating an Instance for steps to launch an instance based on a boot volume. This allows you to switch easily from a bare metal instance to a VM instance and vice versa, or scale up or down the number of cores for an instance.
- **Troubleshooting and repair:** If you think a boot volume issue is causing a compute instance problem, you can stop the instance and detach the boot volume. Then you can

attach it to another instance as a data volume to troubleshoot it. After resolving the issue, you can then reattach it to the original instance or use it to launch a new instance.

Boot volumes are encrypted by default, the same as other block storage volumes. For more information, see Block Volume Encryption.

Important

In-transit encryption for boot and block volumes is only available for virtual machine (VM) instances launched from Oracle-provided images, it is not supported on bare metal instances. It is also not supported in most cases for instances launched from custom images imported for "bring your own image" (BYOI) scenarios. To confirm support for certain Linux-based custom images and for more information contact Oracle support, see Contacting Support.

You can group boot volumes with block volumes into the same volume group, making it easy to create a group volume backup or a clone of your entire instance, including both the system disk and storage disks at the same time. See Volume Groups for more information.

For more information about the Block Volume service and boot volumes, see the Block Volume FAQ.

Custom Boot Volume Sizes

When you launch an instance, you can specify whether to use the selected image's default boot volume size, or you can specify a custom size up to 32 TB. This capability is available for the following image source options:

- Oracle-provided image
- Custom image
- Image OCID

See Creating an Instance for more information.

The specified size must be larger than the image's default boot volume size or 50 GB, whichever is higher. After you launch the instance, you can't change the boot volume size.

If you specify a custom boot volume size, you need to extend the volume to take advantage of the larger size. For steps, see Extending a Root or System Partition.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to list boot volumes. The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes, boot volumes, and backups, but not launch instances.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

To access the Console, you must use a supported browser.

See the following tasks for managing boot volumes:

- Listing Boot Volumes
- Attaching a Boot Volume
- Detaching a Boot Volume

- Listing Boot Volume Attachments
- Deleting a Boot Volume

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage boot volumes:

- BootVolume
- ListBootVolumes
- GetBootVolume
- UpdateBootVolume
- DetachBootVolume
- DeleteVolume
- BootVolumeAttachment
- AttachBootVolume
- GetBootVolumeAttachment
- ListBootVolumeAttachments

Extending the Partition for a Boot Volume

When you create a new virtual machine (VM) instance or bare metal instance based on an Oracle-provided image or custom image, you have the option of specifying a custom boot volume size. You can also expand the size of the boot volume for an existing instance; see Resizing a Volume for more information. In order to take advantage of the larger size, you need to extend the partition for the boot volume.

Required IAM Policy

Extending a partition on an instance does not require a specific IAM policy. However, you may need permission to run the necessary commands on the instance's guest OS. Contact your system administrator for more information.

Extending the Root Partition on a Linux-Based Image

For instances running Linux-based images, you need to extend the root partition and then grow the file system.

PREREQUISITES

Before you can extend the partition, you need to detach the boot volume from the instance and attach it to another instance as a data volume. To do this:

1. Stop the instance. For steps, see Stopping and Starting an Instance.
2. After the instance has stopped, detach the boot volume. For steps, see Detaching a Volume.
3. Attach the boot volume to a second instance as a data volume. For steps, see Attaching a Volume and Connecting to a Volume.

EXTENDING THE LINUX PARTITION

After attaching the boot volume as a data volume to the second instance, connect to this instance and perform the following steps to extend the partition.

Extending the root partition

1. To identify the volume you want to extend the partition for, run the following command to list the attached block volumes:

```
lsblk
```

2. Run the following command to edit the volume's partition table with `parted`:

```
parted <volume_id>
```

   <volume_id> is the volume identifier, for example `/dev/sdc`.

3. When you run `parted`, you may encounter the following error message:

```
Warning: Not all of the space available to <volume_id> appears to be used,
you can fix the GPT to use all of the space (an extra volume_size blocks)
or continue with the current setting?
```

   You are then prompted to fix the error or ignore the error and continue with the current setting. Specify the option to fix the error.

4. Run the following command to change the display units to sectors so that you can see the precise start position for the volume:

```
(parted) unit s
```

5. Run the following command to display the current partitions in the partition table:

```
(parted) print
```

   Make note of the values in the **Number**, **Start**, and **File system** columns for the root partition.

6. Run the following command to remove the existing root partition:

```
(parted) rm <partition_number>
```

   <partition_number> is the value from the **Number** column.

7. Run the following command to recreate the partition:

```
(parted) mkpart
```

   At the `Start?` prompt, specify the value from the **Start** column. At the `File system type?` prompt, specify the value from the **File system** column. Specify `100%` for the `End?` prompt.

8. Run the following command to exit `parted`:

   ```
   (parted) quit
   ```

   This command forces a rewrite of the partition table with the new partition settings that you specified.

9. To verify that the root partition was extended, run the following command to list the attached block volumes:

   ```
   lsblk
   ```

After you extend the root partition, you need to grow the file system. The steps in the following procedure apply only to xfs file systems.

Growing the file system for the root partition

1. Before you grow the file system, repair any issues with the file system on the extended partition by running the following command:

   ```
   xfs_repair <partition_id>
   ```

   <partition_id> is the partition identifier, for example `/dev/sdc3`. See Checking and Repairing an XFS File System for more information.

2. After you have confirmed that there are no more issues to repair, you need to create a mount point to run the `xfs_growfs` against. To do this, create a directory and mount the partition to that directory by running the following commands:

   ```
   mkdir <directory_name>
   mount <partition_id> <directory_name> -o nouuid
   ```

   <partition_id> is the partition identifier, for example `/dev/sdc3`, and *<directory_name>* is the directory to create and mount.

3. After you have created the mount point run the following command to grow the file system:

   ```
   xfs_growfs -d <directory_name>
   ```

   <directory_name> is the name for the directory you created in the previous step.

4. To verify that the file system size is correct, run the following command to display the file system details:

   ```
   df -lh
   ```

5. Once you have verified that the file system size is correct, run the following command to unmount the partition:

   ```
   umount <partition_id>
   ```

Next Steps

After you have extended the partition and grown the file system, you can restart the original instance with the boot volume. To do this:

1. Disconnect the volume from the second instance. For steps, see Disconnecting From a Volume.
2. Detach the volume from the second instance. For steps, see Detaching a Volume.
3. Attach the volume to the original instance as a boot volume. For steps, see Attaching a Boot Volume.
4. Restart the instance. For steps, see Stopping and Starting an Instance.

Extending the System Partition on a Windows-Based Image

On Windows-based images, you can extend a partition using the Windows interface or from the command line using the DISKPART utility.

Windows Server 2016 and Windows Server 2012

The steps for extending a system partition on instances running Windows 2012 or Windows 2016 are the same, and are described in the following procedures.

Extending the system partition using the Windows interface

1. Open the Disk Management system utility on the instance.
2. Right-click the boot volume and select **Extend Volume**.
3. Follow the instructions in the **Extend Volume Wizard**:
   a. Select the disk that you want to extend, enter the size, and then click **Next**.
   b. Confirm that the disk and size settings are correct, and then click **Finish**.
4. Verify that the boot volume's system disk has been extended in Disk Management.

Extending the system partition using the command line with DISKPART

1. Open a command prompt as administrator on the instance.
2. Run the following command to start the DISKPART utility:

   ```
   diskpart
   ```

3. At the `DISKPART` prompt, run the following command to display the instance's volumes:

   ```
   list volume
   ```

4. Run the following command to select the boot volume:

   ```
   select volume <volume_number>
   ```

   <volume_number> is the number associated with the boot volume that you want to extend the partition for.

5. Run the following command to extend the partition:

```
extend size=<increased_size_in_MB>
```

<increased_size_in_MB> is the size in MB that you want to extend the partition to.

Warning

When using the DISKPART utility, do not overextend the partition beyond the current available space. Overextending the partition could result in data loss.

6. To confirm that the partition was extended, run the following command and verify that the boot volume's partition has been extended:

```
list volume
```

WINDOWS SERVER 2008

Use the steps described in the following procedures to extend a system partition on instances running Windows 2008.

Extending the system partition using the Windows interface

1. Open the Server Manager on the instance.
2. Expand the **Storage** node in the left navigation pane and click **Disk Management**.
3. Right-click the boot volume and select **Extend Volume**.
4. Follow the instructions in the **Extend Volume Wizard**:
    a. Select the disk that you want to extend, enter the size, and then click **Next**.
    b. Confirm that the disk and size settings are correct, and then click **Finish**.
5. Verify that the boot volume's system disk has been extended in the Server Manager's **Disk Management** node.

Extending the system partition using the command line with DISKPART

1. Open a command prompt as administrator on the instance.
2. Run the following command to start the DISKPART utility:

```
diskpart
```

3. At the `DISKPART` prompt, run the following command to display the instance's volumes:

```
list volume
```

4. Run the following command to select the boot volume:

```
select volume <volume_number>
```

<volume_number> is the number associated with the boot volume that you want to extend the partition for.

5. Run the following command to extend the partition:

```
extend size=<increased_size_in_MB>
```

<increased_size_in_MB> is the size in MB that you want to extend the partition to.

Warning

When using the DISKPART utility, do not overextend the partition beyond the current available space. Overextending the partition could result in data loss.

6. To confirm that the partition was extended, run the following command and verify that the boot volume's partition has been extended:

```
list volume
```

Attaching a Boot Volume

If a boot volume has been detached from the associated instance, or if the instance is stopped or terminated, you can attach it to another instance as a data volume. The steps are the same as the steps for attaching a block volume, see Attaching a Volume.

You can also reattach a boot volume to the associated instance. If you want to restart an instance with a detached boot volume, you must reattach the boot volume using the steps described in this topic.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to attach/detach existing block volumes. The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups, but not launch instances.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. In the **Instances** list, select the instance you want to attach the boot volume to.
3. Click the name of the instance to display the instance details.
4. In the **Resources**, click **Boot Volume**.
5. Click the Actions icon (three dots) for the boot volume.

6. Click **Attach** and confirm the selection when prompted.
   You can start the instance once the boot volume's icon no longer lists it as **ATTACHING**. For more information, see Stopping and Starting an Instance.

Using the API

To attach a volume to an instance, use the following operation:

- AttachBootVolume

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Listing Boot Volumes

You can list all boot volumes in a specific compartment, or detailed information on a single boot volume.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to list volumes. The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups, but not launch instances.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Boot Volumes**.
2. Choose your **Compartment**.

A detailed list of volumes in the current compartment is displayed. To see detailed information for a specific volume, click the boot volume name.

The instance associated with the boot volume is listed in the **Attached Instance** field. If the value for this field displays:

```
None in this Compartment.
```

the boot volume has been detached from the associated instance, or the instance has been terminated while the boot volume was preserved.

To view the volumes in a different compartment, change the compartment in the **Compartment** drop-down menu.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

List Boot Volumes:

Get a list of boot volumes within a compartment.

- ListBootVolumes

Get a Single Boot Volume:

Get detailed information on a single boot volume:

- GetBootVolume

Overview of Boot Volume Backups

The backups feature of the Oracle Cloud Infrastructure Block Volume service lets you make a point-in-time crash-consistent backup of a boot volume without application interruption or downtime. Boot volume backup capabilities are the same as block volume backup capabilities. See Overview of Block Volume Backups for more information.

There are two ways you can initiate a boot volume backup, the same as block volume backups. You can either manually start the backup, or assign a policy which defines a set backup schedule. See Manual Backups and Policy-Based Backups for more information.

Boot Volume Backup Types

The Block Volume service supports the same backups types for boot volumes as for block volumes:

- **Incremental:** This backup type includes only the changes since the last backup.
- **Full:** This backup type includes all changes since the volume was created.

Backing Up a Boot Volume

You can create boot volume backups using the Console or the REST APIs/command line interface (CLI). See Backing Up a Boot Volume and the BootVolumeBackup API for more information.

Restoring a Boot Volume

Before you can use a boot volume backup, you need to restore it. For steps, see Restoring a Boot Volume.

Making a boot volume backup while an instance is running creates a crash-consistent backup, meaning the data is in the identical state it was in at the time the backup was made. This is the same state it would be in the case of a loss of power or hard crash. In most cases, you can restore a boot volume backup and use it to create an instance. Alternatively you can attach it to an instance as a data volume to repair it or recover data, see Attaching a Volume. To

ensure a bootable image, you should create a custom image from your instance. For information about creating custom images, see Managing Custom Images.

Differences Between Boot Volume Backups and Clones

Consider the following criteria when you decide whether to create a backup or a clone of a volume.

	Volume Backup	Volume Clone
Description	Creates a point-in-time backup of data on a volume. You can restore multiple new volumes from the backup later in the future.	Creates a single point-in-time copy of a volume without having to go through the backup and restore process.
Use case	Retain a backup of the data in a volume, so that you can duplicate an environment later or preserve the data for future use. Meet compliance and regulatory requirements, because the data in a backup remains unchanged over time. Support business continuity requirements. Reduce the risk of outages or data mutation over time.	Rapidly duplicate an existing environment. For example, you can use a clone to test configuration changes without impacting your production environment.
Speed	Slower (minutes or hours)	Faster (seconds)
Cost	Lower cost	Higher cost
Storage location	Object Storage	Block Volume

	Volume Backup	Volume Clone
Retention policy	Policy-based backups expire, manual backups do not expire	No expiration
Volume groups	Supported. You can back up a volume group.	Supported. You can clone a volume group.

Backing Up a Boot Volume

You can create a backup of a boot volume using the Oracle Cloud Infrastructure Block Volume service. This topic describes how to create a manual boot volume backup.

You can also configure a backup policy that creates backups automatically based on a specified schedule and retention policy. This works the same as block volumes. See Policy-Based Backups for more information.

For information to help you decide whether to create a backup or a clone of a boot volume, see Differences Between Boot Volume Backups and Clones.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

Tip

When users create a backup from a volume or restore a volume from a backup, the volume and backup don't have to be in the same compartment. However, users must have access to both compartments.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Boot Volumes**.
2. Click the boot volume that you want to create a backup for.
3. Click **Create Manual Backup**.
4. Enter a name for the backup.
5. Select the backup type, either incremental or full. See Boot Volume Backup Types for information about backup types.
6. Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
7. Click **Create Backup**.
   The backup is completed when its icon no longer lists it as **CREATING** in the **Boot Volume Backup** list.

Using the API

To back up a boot volume, use the following operation:

- CreateBootVolumeBackup

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

For more information about backups, see Overview of Block Volume Backups and Restoring a Backup to a New Volume.

Cloning a Boot Volume

You can create a clone from a boot volume using the Oracle Cloud Infrastructure Block Volume service. Cloning enables you to make a copy of an existing boot volume without needing to go through the backup and restore process. For more information about the Block Volume service, see Overview of Block Volume and the Block Volume FAQ.

A boot volume clone is a point-in-time direct disk-to-disk deep copy of the source boot volume, so all the data that is in the source boot volume when the clone is created is copied to the boot volume clone. Any subsequent changes to the data on the source boot volume are not copied to the boot volume clone. Since the clone is a copy of the source boot volume it will be the same size as the source boot volume unless you specify a larger volume size when you create the clone.

The clone operation occurs immediately and you can use the cloned boot volume as soon as the state changes to available.

There is a single point-in-time reference for a source boot volume while it is being cloned, so if you clone a boot volume while the associated instance is running, you need to wait for the first clone operation to complete from the source before creating additional clones. You also need to wait for any backup operations to complete as well.

You can only create a clone for a boot volume within the same region, availability domain, and tenant. You can create a clone for a boot volume between compartments as long as you have the required access permissions for the operation.

Differences Between Boot Volume Backups and Clones

Consider the following criteria when you decide whether to create a backup or a clone of a volume.

	Volume Backup	Volume Clone
Description	Creates a point-in-time backup of data on a volume. You can restore multiple new volumes from the backup later in the future.	Creates a single point-in-time copy of a volume without having to go through the backup and restore process.
Use case	Retain a backup of the data in a volume, so that you can duplicate an environment later or preserve the data for future use. Meet compliance and regulatory requirements, because the data in a backup remains unchanged over time. Support business continuity requirements. Reduce the risk of outages or data mutation over time.	Rapidly duplicate an existing environment. For example, you can use a clone to test configuration changes without impacting your production environment.
Speed	Slower (minutes or hours)	Faster (seconds)
Cost	Lower cost	Higher cost
Storage location	Object Storage	Block Volume

	Volume Backup	Volume Clone
Retention policy	Policy-based backups expire, manual backups do not expire	No expiration
Volume groups	Supported. You can back up a volume group.	Supported. You can clone a volume group.

For more information about boot volume backups, see Overview of Boot Volume Backups and Backing Up a Boot Volume.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Boot Volumes**.
2. In the **Boot Volumes** list, click the boot volume that you want to clone.
3. In **Resources**, click **Boot Volume Clones**.
4. Click **Create Clone**.
5. Specify a name for the clone.
6. If you want to clone the boot volume to a larger size volume, select **Custom Boot Volume Size (GB)** and then specify the new size. You can only increase the size of the volume, you cannot decrease the size. If you clone the boot volume to a larger size volume, you need to extend the volume's partition. See Extending the Partition for a Boot Volume for more information.
7. Click **Create Clone**.

The boot volume is ready use when its icon lists it as **AVAILABLE** in the **Boot Volumes** list.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

To create a clone from a boot volume, use the CreateBootVolume operation and specify BootVolumeSourceFromBootVolumeDetails for CreateBootVolumeDetails.

Next Steps

After you have cloned a boot volume backup, you can:

- Use the boot volume to create an instance. For more information, see Creating an Instance.
- Attach the boot volume to an instance as a data volume. For more information, see Attaching a Volume.

Making a boot volume clone while an instance is running creates a crash-consistent clone, meaning the data is in the identical state it was in at the time the clone was made. This is the same state it would be in the case of a loss of power or hard crash. In most cases you can use the cloned boot volume to create an instance, however to ensure a bootable image, you should create a custom image from your instance. For information about creating custom images, see Managing Custom Images.

Detaching a Boot Volume

If you think a boot volume issue is causing a compute instance problem, you can stop the instance and detach the boot volume using the steps described in this topic. Then you can attach it to another instance as a data volume to troubleshoot it.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to attach/detach existing block volumes. The policy in Let volume admins manage block

volumes, backups, and volume groups lets the specified group do everything with block volumes and backups, but not launch instances.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

You can only detach a boot volume from an instance when the instance is stopped. See Stopping and Starting an Instance for more information about managing an instance's state.

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. Choose your **Compartment**.
3. In the **Instances** list, select the instance you want to detach the boot volume from.
4. Click the name of the instance to display the instance details.
5. In the **Resources**, click **Boot Volume**.
6. Click the Actions icon (three dots), for the boot volume.
7. Click **Detach** and confirm the selection when prompted.

You can now attach the boot volume to another instance, for more information see Attaching a Volume.

Using the API

To delete an attachment, use the following operation:

- DetachBootVolume

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Deleting a Boot Volume

When you terminate an instance, you choose to delete or preserve the associated boot volume. For more information, see Terminating an Instance. You can also delete a boot volume if it has been detached from the associated instance. See Detaching a Boot Volume for how to detach a boot volume.

Warning

You cannot undo this operation. Any data on a volume will be permanently deleted once the volume is deleted. You will also not be able to restart the associated instance.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let volume admins manage block volumes, backups, and volume groups lets the specified group do everything with block volumes and backups.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Boot Volumes**.
2. Choose your **Compartment**.

3. In the **Boot Volumes** list, find the volume you want to delete.
4. Click the Actions icon (three dots) for the boot volume.
5. Click **Terminate** and confirm the selection when prompted.

Using the API

Use the DeleteBootVolume operation to delete a boot volume.

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Boot Volume Metrics

You can monitor the health, capacity, and performance of your Compute instances by using metrics, alarms, and notifications.

The Block Volume service provides a set of metrics that apply to both boot volumes and block volumes. For more information, see Block Volume Metrics.

Recovering a Corrupted Boot Volume for Linux-Based Instances

If your instance fails to boot successfully or boots with the boot volume set to read-only access, the instance's boot volume may be corrupted. While it is rare, boot volume corruption can occur in the following scenarios:

- When an instance experiences a forced shutdown using the API.
- When an instance experiences a system hang due to an operating system or software error and a graceful reboot or shutdown of the instance times out, and then a forced shutdown occurs.
- When an error or outage occurs in the underlying infrastructure and there were critical disk writes pending in the system.

Important

In most cases a simple reboot will resolve boot volume corruption issues, so this is the first action you should take when troubleshooting this.

This topic describes how to determine if your Linux-based instance's boot volume is corrupted and what steps to take to troubleshoot and recover the corrupted boot volume. For Windows instances, see Recovering a Corrupted Boot Volume for Windows Instances.

Detecting Boot Volume Corruption

Boot volume corruption can prevent an instance from booting successfully, so you may not be able to connect to the instance using SSH. Instead, you can use the instance console connection feature to connect to the malfunctioning instance. For more information about using this feature, see Instance Console Connections.

This section describes how to use a serial console connection to detect if boot volume corruption has occurred.

Tip

If you have already confirmed your instance's boot volume is corrupted or if you are using an imported custom image, proceed to the Recovering the Boot Volume section, which describes how to use a second instance along with standard file system tools to both detect and repair boot volume corruption.

1. Create a serial console connection for the instance.

   ### To create the serial console connection for an instance

   a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.

   b. In the list of instances, find the instance you think may have a corrupted boot volume, and then click the instance name.

   c. In the **Resources** section on the **Instance Details** page, click **Console Connections**, and then click **Create Console Connection**.

   d. Specify the public key portion for the SSH key, either by browsing and selecting a public key file, for example id_rsa.pub, or by pasting your public key into the text box, and then click **Create Console Connection**.

2. Connect to the instance through serial console.

   ### To connect to the serial console for an instance using OpenSSH on Mac OS X or Linux

   a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. Click the instance you want to connect to.

   b. On the **Instances Details** page, in the **Resources** section, click **Console Connections**.

   c. Click the Actions icon (three dots), and then click **Connect with SSH**.

   d. Select **LINUX/MAC OS** for **PLATFORM**.

   e. Click **Copy** to copy the string to the clipboard.

   f. Paste the connection string copied from the previous step to a terminal window on a Mac OS X or Linux system, and hit enter to connect to the console.

      If you are not using the default SSH key or ssh-agent, you can modify the serial console connection string to include the identity file flag, `-i` to specify the SSH

key to use. You need to specify this for both the SSH connection and the SSH ProxyCommand, as shown in the following line:

```
ssh -i /<path>/<ssh_key> -o ProxyCommand='ssh -i /<path>/<ssh_key> -W %h:%p -p 443...
```

g. Hit enter again to activate the console.

At this point, it's normal for the serial console to appear to hang, as the system may have already crashed.

3. Reboot the instance from the Console, on the **Instances Details page**, click **Reboot**.
4. Once the reboot process starts, switch back to the terminal window, and you should see system messages from the instance start to appear in the window.
5. Monitor the messages that appear as the system is starting up. Most operating systems will set the boot volume to read-only as soon as disk corruption is detected to prevent writes from further corrupting the volume, so look for messages that indicate the boot volume is in read-only mode. Following are some examples:
   - On an instance with iSCSI-attached boot volumes, the `iscsiadm` service will fail to attach a volume because the volume is in read-only mode. This will typically prevent instances from continuing to boot. The serial console may display a message similar to the following:

     ```
     iscsiadm: Maybe you are not root?
     iscsiadm: Could not lock discovery DB: /var/lock/iscsi/lock.write: Read-only file system
     touch: cannot touch `/var/lock/subsys/iscsid': Read-only file system
     touch: cannot touch `/var/lock/subsys/iscsi': Read-only file system
     ```

   - On an instance with paravirtualized-attached boot volumes, the system may continue the boot process, but will be in a degraded state because nothing can be written to the boot drive.The serial console may display error messages similar to the following:

     ```
     [FAILED] Failed to start Create Volatile Files and Directories.
     See 'systemctl status systemd-tmpfiles-setup.service' for details.
     ...
     [   27.160070] cloud-init[819]:     os.chmod(path, real_mode)
     [   27.166027] cloud-init[819]: OSError: [Errno 30] Read-only file system:
     '/var/lib/cloud/data'
     ```

The error messages and system behavior described here are the most commonly seen for boot volume corruption, however depending on the operating system, you may see different error messages and system behavior. If you don't see the ones described here, consult the documentation for your operating system for additional troubleshooting information.

Recovering the Boot Volume

To troubleshoot and recover the corrupted boot volume, you need to detach the boot volume from the instance and then attach the boot volume to a second instance as a data volume.

DETACHING THE BOOT VOLUME

If you have detected that your instance's boot volume is corrupted, you need to detach the boot volume from the instance before you can begin troubleshooting and recovery steps.

1. Stop the instance. For more information, see Stopping and Starting an Instance.

   #### To stop the instance

   a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.

   b. In the list of instances, find the instance you have detected boot volume corruption for and then click the instance name to display the instance details.

   c. Click **Stop**.

2. Detach the boot volume from the instance. For more information, see Detaching a Boot Volume.

   #### To detach the boot volume from the instance

   a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.

   b. In the **Instances** list, select the instance you want to detach the boot volume from.

c. Click the name of the instance to display the instance details.

d. In the **Resources**, click **Boot Volume**.

e. Click the Actions icon (three dots), for the boot volume.

f. Click **Detach** and confirm the selection when prompted.

ATTACHING THE BOOT VOLUME AS A DATA VOLUME TO A SECOND INSTANCE

For the second instance we recommend that you use an instance running an operating system that most closely matches the operating system for the boot volume's instance. You should only attach boot volumes for Linux-based instances to other Linux-based instances. The second instance must be in the same availability domain and region as the boot volume's instance. If no existing instance is available, create a new Linux instance using the steps described in Creating an Instance. Once you have the second instance, make sure you can log into the instance and that it is functional before proceeding with the recovery steps. For steps to access the instance, see Connecting to a Linux Instance. After you have confirmed that the instance is functional, perform the following steps.

1. Run the `lsblk` command and make note of the drives that are currently on the instance, for example:

```
lsblk
NAME   MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
sda      8:0    0 46.6G  0 disk
├─sda2   8:2    0    8G  0 part [SWAP]
├─sda3   8:3    0 38.4G  0 part /
└─sda1   8:1    0  200M  0 part /boot/efi
```

2. Attach the boot volume to the second instance as a data volume. For more information, see Attaching a Volume.

To attach the boot volume as a data volume

a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.

b. In the **Instances** list, click the instance that you want to attach a volume to.

c. In the **Resources** section, click **Attached Block Volumes**.

d. Click **Attach Block Volume**.

e. Select the volume attachment type. If **Paravirtualized** attachments are available for this instance, we recommend that you select this attachment type for this procedure.

If you select **iSCSI** as the volume attachment type, you need to connect to the volume, see Connecting to a Volume for more information.

f. In the **Block Volume Compartment** drop-down list, select the compartment.

g. Choose the **SELECT VOLUME** option and then select the volume from the **Boot Volume** section of the **Block Volume** drop-down list.

h. Select **Read/Write** as the access type.

i. Click **Attach**.

When the volume's icon no longer lists it as **Attaching**, proceed with the next steps.

3. Run the `lsblk` command again to confirm that the boot volume now shows up as a volume attached to the instance. In this sample output for the `lsblk`, the boot volume attached as a data volume shows up as `sdb`:

```
lsblk
NAME   MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
sdb      8:16   0 46.6G  0 disk
├─sdb2   8:18   0    8G  0 part
├─sdb3   8:19   0 38.4G  0 part
└─sdb1   8:17   0  200M  0 part
sda      8:0    0 46.6G  0 disk
├─sda2   8:2    0    8G  0 part [SWAP]
├─sda3   8:3    0 38.4G  0 part /
└─sda1   8:1    0  200M  0 part /boot/efi
```

4. Run the `fsck` command on the volume's root partition. The root partition is usually the largest partition on the volume.

The following sample for the `fsck` command shows the output when there are no errors or corruption present on the partitions for an Oracle 7.6 instance:

```
sudo fsck -V /dev/sdb1
fsck from util-linux 2.23.2
[/sbin/fsck.vfat (1) -- /boot/efi] fsck.vfat /dev/sdb1
fsck.fat 3.0.20 (12 Jun 2013)
/dev/sdb1: 17 files, 2466/51145 clusters

sudo fsck -V /dev/sdb2
fsck from util-linux 2.23.2

sudo fsck -V /dev/sdb3
fsck from util-linux 2.23.2
[/sbin/fsck.xfs (1) -- /] fsck.xfs /dev/sdb3
If you wish to check the consistency of an XFS filesystem or
repair a damaged filesystem, see xfs_repair(8).
```

If errors are present on a partition, you will usually be prompted to repair the errors. Following is an example of an interactive repair session of a corrupt ext4 boot volume for an Ubuntu instance:

```
sudo fsck -V /dev/sdb1
fsck from util-linux 2.31.1
[/sbin/fsck.ext4 (1) -- /] fsck.ext4 /dev/sdb1
e2fsck 1.44.1 (24-Mar-2018)
One or more block group descriptor checksums are invalid.  Fix<y> yes
Group descriptor 92 checksum is 0xe9a1, should be 0x1f53.  FIXED.
Pass 1: Checking inodes, blocks, and sizes
Pass 2: Checking directory structure

Pass 3: Checking directory connectivity
Pass 4: Checking reference counts
Pass 5: Checking group summary information
Block bitmap differences: Group 92 block bitmap does not match checksum.
FIXED.

cloudimg-rootfs: ***** FILE SYSTEM WAS MODIFIED *****
cloudimg-rootfs: 75336/5999616 files (0.1% non-contiguous), 798678/12181243 blocks
```

Note

XFS file systems will usually auto-repair their contents when the system boots up, fixing any corruption during the boot process. You can use the `xfs_repair` command to force a repair for scenarios where boot volume corruption is preventing the auto-repair functionality from working, as shown in the following example:

```
sudo xfs_repair /dev/sdb3
Phase 1 - find and verify superblock...
Phase 2 - using internal log
- zero log...
- scan filesystem freespace and inode maps...
...
Phase 7 - verify and correct link counts...
done
```

Recovering a Corrupted Boot Volume for Windows Instances

If your instance fails to boot successfully or boots with the boot volume set to read-only access, the instance's boot volume may be corrupted. While it is rare, boot volume corruption can occur in the following scenarios:

- When an instance experiences a forced shutdown using the API.
- When an instance experiences a system hang due to an operating system or software error and a graceful reboot or shutdown of the instance times out, and then a forced shutdown occurs.
- When an error or outage occurs in the underlying infrastructure and there were critical disk writes pending in the system.

Important

In most cases a simple reboot will resolve boot volume corruption issues, so this is the first action you should take when troubleshooting this.

This topic describes how to determine if your Windows instance's boot volume is corrupted and what steps to take to troubleshoot and recover the corrupted boot volume. For Linux-based instances, see Recovering a Corrupted Boot Volume for Linux-Based Instances.

Detecting Boot Volume Corruption

When Windows operating systems detect boot volume corruption, the instance is usually able to recover from it by automatically repairing the file system. You can use a VNC console connection to verify that the instance isn't experiencing a system hang while repairing the file system, or to detect if there are other issues. VNC console connections enable you to see what's displayed through the VGA port, for more information about the VNC console, see Instance Console Connections.

Important

VNC console connections only work for virtual machine (VM) instances launched on October 13th, 2017 or later, and bare metal instances, launched on February 21, 2019 or later. If your instance does not support VNC console connections, proceed to Recovering the Boot Volume.

1. Create a VNC console connection for the instance.

   ### To create the VNC console connection for an instance

   a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.

   b. In the list of instances, find the instance you think may have a corrupted boot volume, and then click the instance name.

   c. In the **Resources** section on the **Instance Details** page, click **Console Connections**, and then click **Create Console Connection**.

   d. Specify the public key portion for the SSH key, either by browsing and selecting a public key file, for example id_rsa.pub, or by pasting your public key into the text box, and then click **Create Console Connection**.

2. Connect to the instance through VNC console.

   ### To set up a secure tunnel to the VNC server on the instance using PowerShell on Windows

   a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. Click the instance you want to connect to.

   b. On the **Instances Details** page, in the **Resources** section, click **Console Connections**.

   c. Click the Actions icon (three dots), and then click **Connect with VNC**.

   d. Select **WINDOWS** for **PLATFORM**.

   e. Click **Copy** to copy the string to the clipboard.

   f. Paste the connection string copied from the previous step to Windows Powershell and hit enter to set up the secure connection.

   g. Once the connection has been established, open your VNC client and specify `localhost` as the host to connect to and `5900` as the port to use.

Check what is displayed in the VNC console to see if the instance is stuck in the boot process or if it is in the recovery partition.

Tip

For Windows 2012 and Windows 2016 operating systems, if the instance has booted into the recovery partition it may be possible to directly perform the steps to recover the boot volume in the recovery partition .

Detaching the Boot Volume

If you have detected that your instance's boot volume is corrupted, you need to detach the boot volume from the instance before you can begin troubleshooting and recovery steps.

1. Stop the instance. For more information, see Stopping and Starting an Instance.

   To stop the instance

   a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
   b. In the list of instances, find the instance you have detected boot volume corruption for and then click the instance name to display the instance details.
   c. Click **Stop**.

2. Detach the boot volume from the instance. For more information, see Detaching a Boot Volume.

   To detach the boot volume from the instance

   a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.

b. In the **Instances** list, select the instance you want to detach the boot volume from.
c. Click the name of the instance to display the instance details.
d. In the **Resources**, click **Boot Volume**.
e. Click the Actions icon (three dots), for the boot volume.
f. Click **Detach** and confirm the selection when prompted.

Recovering the Boot Volume

To troubleshoot and recover the corrupted boot volume, you need to attach the boot volume to a second instance as a data volume. For the second instance we recommend that you use an instance running an operating system that most closely matches the operating system for the boot volume's instance, and you should only attach boot volumes for Windows instances to other Windows instances. The second instance must be in the same availability domain and region as the boot volume's instance. If no existing instance is available create a new Windows instance using the steps described in Creating an Instance.

Once you have the second instance, make sure you can log in to the instance and that it is functional before proceeding with the recovery steps. After you have confirmed that the instance is functional perform the following steps.

1. Attach the boot volume to the second instance as a data volume. For more information, see Attaching a Volume.

To attach the boot volume as a data volume

a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
b. In the **Instances** list, click the instance that you want to attach a volume to.
c. In the **Resources** section, click **Attached Block Volumes**.
d. Click **Attach Block Volume**.

e. Select **iSCSI** for the volume attachment type.
f. In the **Block Volume Compartment** drop-down list, select the compartment.
g. Choose the **SELECT VOLUME** option and then select the volume from the **Boot Volume** section of the **Block Volume** drop-down list.
h. Select **Read/Write** as the access type.
i. Click **Attach**.
When the volume's icon no longer lists it as **Attaching**, proceed with the next steps.

2. Connect to the second instance, see Connecting to a Windows Instance for more information.
3. Connect to the volume, see Connecting to a Volume on a Windows Instance for more information. Since you are attaching a boot volume as a data volume you must also run the `Connect-IscsiTarget` and set `IsMultiEnabled` to true. For example:

```
Set-Service -Name msiscsi -StartupType Automatic
Start-Service msiscsi
New-IscsiTargetPortal –TargetPortalAddress 169.254.2.4
Connect-IscsiTarget -NodeAddress iqn.2015-02.oracle.boot:uefi -TargetPortalAddress 169.254.2.4 -
IsPersistent $True -IsMultipathEnabled $True
```

4. Open **Computer Management** and navigate to **Storage**, and then **Disk Management**.
5. Select the new disk and mark it **Online**.
6. Click **This PC** and then right-click on the new disk and select **Properties**.
7. Navigate to **Tools**, **Error Checking**, and then **Check**.
8. Select **Scan Drive** and fix issues as they come up.
9. Mark the new disk **Offline**.
10. Open iscsi initiator with administrator privileges.
11. In **Favorite Targets**, remove the iscsi target of the attached volume.

Oracle-Provided Images

An image is a template of a virtual hard drive. The image determines the operating system and other software for an instance. The following table lists the images that are available in Oracle Cloud Infrastructure. For specific image and kernel version details, along with changes between versions, see Oracle-Provided Image Release Notes.

Image	Name	Description
Oracle Linux 7 Unbreakable Enterprise Kernel Release 5	Oracle-Linux-7.*x*-<*date*>-<*number*>	The Unbreakable Enterprise Kernel (UEK) is Oracle's optimized operating system kernel for demanding Oracle workloads. GPU shapes are supported with this image.
Oracle Linux 6 Unbreakable Enterprise Kernel Release 4	Oracle-Linux-6.*x*-<*date*>-<*number*>	The Unbreakable Enterprise Kernel (UEK) is Oracle's optimized operating system kernel for demanding Oracle workloads.
CentOS 7	CentOS-7-<*date*>-<*number*>	CentOS is a free, open-source Linux distribution that is suitable for use in enterprise cloud environments. For more information, see https://www.centos.org/.
CentOS 6	CentOS-6.*x*-<*date*>-<*number*>	CentOS is a free, open-source Linux distribution that is suitable for use in enterprise cloud environments. For more information, see https://www.centos.org/.

Image	Name	Description
Ubuntu 18.04 LTS	Canonical-Ubuntu-18.04-<*date*>-<*number*>	Ubuntu is a free, open-source Linux distribution that is suitable for use in the cloud. For more information, see https://www.ubuntu.com. Minimal Ubuntu is designed for automated use at scale. It uses a smaller boot volume, boots faster, and has a smaller surface for security patches than standard Ubuntu images. For more information, see https://wiki.ubuntu.com/Minimal. GPU shapes are supported with this image. You must install the appropriate GPU drivers from NVIDIA.
Ubuntu 16.04 LTS	Canonical-Ubuntu-16.04-<*date*>-<*number*>	Ubuntu is a free, open-source Linux distribution that is suitable for use in the cloud. For more information, see https://www.ubuntu.com. Minimal Ubuntu is designed for automated use at scale. It uses a smaller boot volume, boots faster, and has a smaller surface for security patches than standard Ubuntu images. For more information, see https://wiki.ubuntu.com/Minimal. GPU shapes are supported with this image. For Minimal Ubuntu, you must install the appropriate GPU drivers from NVIDIA.
Ubuntu 14.04 LTS	Canonical-Ubuntu-14.04-<*date*>-<*number*>	Ubuntu is a free, open-source Linux distribution that is suitable for use in the cloud. For more information, see https://www.ubuntu.com.

Image	Name	Description
Windows Server 2016	Windows-Server-2016-<*edition*>-Gen2.<*date*>-<*number*>	Windows Server 2016 supports running production Windows workloads on Oracle Cloud Infrastructure. GPU shapes are supported with this image. You must install the appropriate GPU drivers from NVIDIA.
Windows Server 2012 R2	Windows-Server-2012-R2-<*edition*>-<*gen*>-<*date*>-<*number*>	Windows Server 2012 R2 supports running production Windows workloads on Oracle Cloud Infrastructure. GPU shapes are supported with this image. You must install the GPU drivers from NVIDIA.
Windows Server 2008 R2 - Virtual Machine (VM)	Windows-Server-2008-R2-Enterprise-Edition-VM-<*date*>-<*number*>	Windows Server 2008 R2 Enterprise Edition supports running production Windows workloads on Oracle Cloud Infrastructure.

You also can create custom images of your boot disk OS and software configuration for launching new instances.

Essential Firewall Rules

Warning

Windows 2008 Server R2 images do not support restricting certain firewall rules for local principals, such as "Administrators", so any authenticated user on an instance can make outgoing connections to the iSCSI network endpoints (169.254.0.2:3260, 169.254.2.0/24:3260) that serve the instance's boot and block volumes.

All Oracle-provided images include rules that allow only "root" on Linux instances or "Administrators" on Windows Server 2012 R2 and Windows Server 2016 instances to make outgoing connections to the iSCSI network endpoints (169.254.0.2:3260, 169.254.2.0/24:3260) that serve the instance's boot and block volumes.

- Oracle recommends that you do not reconfigure the firewall on your instance to remove these rules. Removing these rules allows non-root users or non-administrators to access the instance’s boot disk volume.
- Oracle recommends that you do not create custom images without these rules unless you understand the security risks.
- Running Uncomplicated Firewall (UFW) on Ubuntu images may cause issues with these rules, so Oracle recommends that you do not enable UFW on your instances. See Ubuntu Instance fails to reboot after enabling Uncomplicated Firewall (UFW) for more information.

User Data

Oracle-provided images provide you with the ability to run custom scripts or provide custom metadata when the instance launches. To do this, you specify a custom startup script in the **Create Instance** dialog's **User Data** field. For more information about startup scripts, see cloud-init for Linux-based images and cloudbase-init for Windows-based images.

OS Updates for Linux Images

Oracle Linux and CentOS images are preconfigured to let you install and update packages from the repositories on the Oracle public yum server. The repository configuration file is in the `/etc/yum.repos.d` directory on your instance. You can install, update, and remove packages by using the yum utility.

Note

OS Security Updates for Oracle Linux and CentOS images

After you launch an instance using Oracle Linux or CentOS images, you are responsible for applying the required OS security updates published through the Oracle public yum server. For more information, see Installing and Using the Yum Security Plugin.

The Ubuntu image is preconfigured with suitable repositories to allow you to install, update, and remove packages.

Note

OS Security Updates for the Ubuntu image

After you launch an instance using the Ubuntu image, you are responsible for applying the required OS security updates using the `sudo apt-get upgrade` command.

Linux Kernel Updates

Oracle Linux images on Oracle Cloud Infrastructure include Oracle Linux Premier Support at no extra cost. This gives you all the services included with Premier Support, including Oracle

Ksplice. Ksplice enables you to apply important security and other critical kernel updates without a reboot. For more information, see About Oracle Ksplice and Ksplice Overview.

Ksplice is only available for Linux instances launched on or after February 15, 2017. For instances launched before August 25, 2017, you must install Ksplice before running it. See Installing and Running Oracle Ksplice for more information.

Note

Ksplice Support

Oracle Ksplice is not supported for CentOS and Ubuntu images, or on Linux images launched before February 15, 2017.

Configuring Automatic Package Updating on Instance Launch

You can configure your instance to automatically update to the latest package versions when the instance first launches using a cloud-init startup script. To do this, add the following code to the startup script:

```
package_upgrade: true
```

The upgrade process starts when the instance launches and runs in the background until it completes. To verify that it completed successfully, check the cloud-init logs in `/var/log`.

See User Data and Cloud config examples - Run apt or yum upgrade for more information.

Linux Image Details

See Lifetime Support Policy: Coverage for Oracle Linux and Oracle VM for details about the Oracle Linux support policy.

Users

For instances created using Oracle Linux and CentOS images, the user name `opc` is created automatically. The `opc` user has `sudo` privileges and is configured for remote access over the SSH v2 protocol using RSA keys. The SSH public keys that you specify while creating instances are added to the `/home/opc/.ssh/authorized_keys` file.

For instances created using the Ubuntu image, the user name `ubuntu` is created automatically. The `ubuntu` user has `sudo` privileges and is configured for remote access over the SSH v2 protocol using RSA keys. The SSH public keys that you specify while creating instances are added to the `/home/ubuntu/.ssh/authorized_keys` file.

Note that `root` login is disabled.

Remote Access

Access to the instance is permitted only over the SSH v2 protocol. All other remote access services are disabled.

Firewall Rules

Instances created using Oracle-provided images have a default set of firewall rules which allow only SSH access. Instance owners can modify those rules as needed, but must not restrict link local traffic to address 169.254.0.2 in accordance with the warning at the top of this page.

Be aware that Networking uses security lists to control packet-level traffic in and out of the instance. When troubleshooting access to an instance, make sure both the security lists associated with the instance's subnet and the instance's firewall rules are set correctly.

Cloud-init Compatibility

Instances created using Oracle-provided images are compatible with cloud-init. When launching an instance with the Core Services API, you can pass cloud-init directives with the metadata parameter. For more information, see LaunchInstance.

OCI Utilities

Instances created using Oracle Linux include a preinstalled set of utilities that are designed to make it easier to work with Oracle Linux images. These utilities consist of a service component and related command line tools.

The following table summarizes the components that are included in the OCI utilities.

Name	Description
`ocid`	The service component of oci-utils. This normally runs as a daemon started via `systemd`. This service scans for changes in the iSCSI and VNIC device configurations and caches the OCI metadata and public IP address of the instance.
`oci-iscsi-config`	Used to display and configure iSCSI devices attached to a compute instance. If no command line options are specified, lists devices that need attention.
`oci-metadata`	Displays metadata for the compute instance. If no command line options are specified, lists all available metadata. Metadata includes the instance OCID, display name, compartment, shape, region, availability domain, creation date, state, image, and any custom metadata that you provide, such as an SSH public key.
`oci-network-config`	Lists or configures Virtual Network Interface Cards (VNICs) attached to the compute instance. Lists the current Virtual Network Interface Cards (VNICs) provisioned in the cloud and configured on the instance. When a secondary VNIC is provisioned in the cloud, it must be explicitly configured on the instance using this script or similar commands.
`oci-public-ip`	Displays the public IP address of the current system in either human-readable or JSON format.

For more detailed information, see the OCI Utilities reference.

Windows OS Updates for Windows Images

Windows images include the Windows Update utility, which you can run to get the latest Windows updates from Microsoft. You have to configure the security list on the subnet on which the instance is running to allow instances to access Windows update servers.

Windows Image Details

Users

For instances created using Oracle-provided Windows images, the user name `opc` is created automatically. When you launch an instance using the Windows image, Oracle Cloud Infrastructure will generate an initial, one-time password that you can retrieve using the console or API. This password must be changed after you initially log on.

Remote Access

Access to the instance is permitted only through a Remote Desktop connection.

Firewall Rules

Instances created using the Windows image have a default set of firewall rules which allow Remote Desktop protocol or RDP access on port 3389. Instance owners can modify these rules as needed, but must not restrict link local traffic to 169.254.169.253 for the instance to activate with Microsoft Key Management Service (KMS). This is how the instance stays active and licensed.

Be aware that Networking uses security lists to control packet-level traffic in and out of the instance. When troubleshooting access to an instance, make sure both the security lists associated with the instance's subnet and the instance's firewall rules are set correctly.

User Data on Windows Images

On Windows images custom user data scripts are executed using cloudbase-init, which is the equivalent of cloud-init on Linux-based images. All Oracle-provided Windows images on Oracle Cloud Infrastructure include cloudbase-init installed by default. When an instance launches, cloudbase-init runs PowerShell, batch scripts, or additional user data content. See cloudbase-init Userdata for information about supported content types.

You can use user data scripts to perform various tasks, such as:

- Enable GPU support using a custom script to install the applicable GPU driver.
- Add or update local user accounts.
- Join the instance to a domain controller.
- Install certificates into the certificate store.
- Copy any required application workload files from the Object Storage service directly to the instance.

Warning

Do not include anything in the script that could trigger a reboot as this could impact the instance launch, causing it to fail. Any actions requiring a reboot should only be performed once the instance state is **RUNNING**.

Windows Remote Management

Windows Remote Management (WinRM) is enabled by default on Oracle-provided Windows images. WinRM provides you with the capability to remotely manage the operating system.

To use WinRM you need to add a stateful ingress rule for TCP traffic on destination port 5986.

Warning

Opening this port allows WinRM connections from public IP addresses. To only allow access from instances within the VCN ensure that this port is open on the appropriate security lists for the appropriate subnets. For more information, see Security Recommendations.

To enable WinRM access

1. Open the navigation menu. Under **Core Infrastructure**, go to **Networking** and click **Virtual Cloud Networks**.
2. Click the VCN you're interested in.
3. Click **Security Lists**, and then click the security list you're interested in.
4. Click **Edit All Rules**.
5. Under **Allow Rules for Ingress**, click **Add Rule**.
6. Enter the following for your new rule:
    a. **Source Type:** CIDR
    b. **Source CIDR:** 0.0.0.0/0
    c. **IP Protocol:** TCP
    d. **Source Port Range:** All
    e. **Destination Port Range:** 5986
7. When done, click **Save Security List Rules**.

To use WinRM on an instance

1. Get the instance's public IP address, see Getting the Instance Public IP Address and

Initial Windows Password.

2. Open Windows PowerShell on the Windows client you using to connect to the instance.
3. Run the following command:

```
# Get the public IP from your OCI running windows instance
$ComputerName = Public IP Address

# Store your username and password credentials (default username is opc)
$c = Get-Credential

# Options
$opt = New-PSSessionOption -SkipCACheck -SkipCNCheck -SkipRevocationCheck

# Create new PSSession (Pre-requisite: ensure security list has Ingress Rule for port 5986)
$PSSession = New-PSSession -ComputerName $ComputerName -UseSSL -SessionOption $opt -
Authentication Basic -Credential $c

# Connect to Instance PSSession
Enter-PSSession $PSSession

# To close connection use: Exit-PSSession
```

You can now remotely manage your Windows instance from your local PowerShell client.

Using NVIDIA GPU Cloud with Oracle Cloud Infrastructure

NVIDIA GPU Cloud (NGC) is a GPU-accelerated cloud platform optimized for deep learning and scientific computing. This topic provides an overview of how to use NGC with Oracle Cloud Infrastructure.

NVIDIA makes available on Oracle Cloud Infrastructure a customized Compute image optimized for the NVIDIA® Tesla Volta™ and Pascal™ GPUs . Running NGC containers on this instance provides optimum performance for deep learning jobs.

For those familiar with Oracle Cloud Infrastructure, to use NGC, you need to log into the Console, configure the settings as needed, and then create an instance based on the NGC image by specifying the image OCID. After launching the instance, you can SSH into the

instance and start running deep learning jobs using framework containers from the NGC container registry.

Prerequisites

- An Oracle Cloud Infrastructure tenancy. For more information, see Signing Up for Oracle Cloud Infrastructure.
- A cloud network to launch the instance into. For information about setting up cloud networks, see Using the Console in VCNs and Subnets.
- A key pair, to use for connecting to the instance via SSH. For information about generating a key pair, see Managing Key Pairs on Linux Instances.
- Security group and policy configured for the File Storage service. For more information, see Managing Groups, Getting Started with Policies, and Details for the File Storage Service.
- An NGC API key for authenticating with the NGC service.

To generate your NGC API key

1. Log into the NGC website.
2. On the NGC Registry page, click **Get API Key**.
3. Click **Generate API Key** and then click **Confirm** to generate the key. If you have an existing API key it will become invalid once you generate a new key.

Launching an instance based on the NGC image

USING THE CONSOLE

1. Open the Console, see Signing In to the Console for steps on how to do this.
2. Click **Compute**, choose a compartment you have permission to work in, and then click **Create Instance**.
3. In the **Create Instance** dialog box, specify the instance name, and select the availability domain for the instance.

4. Select **Image OCID** for **Boot Volume**.
5. Specify the image OCID applicable to your region as the **Image OCID**.

Region	Image OCID
us-ashburn-1	ocid1.image.oc1.iad.aaaaaaaaikn6ub6heefqxbe5fkiv4otbfe6ivza6y7di5khnkxkyvf2bkdta
eu-frankfurt-1	ocid1.image.oc1.eu-frankfurt-1.aaaaaaaauwuafl6uze6bnusphnn6y2mr5y7ajavx4kza7glyrqggxlnbo4zq

6. Select **Bare Metal Machine** for **Shape Type**.
7. Select the shape you want to use for **Shape**.
8. For **SSH Keys**, click **Choose SSH Key File**, navigate to the location where you saved the public key portion (.pub) of the SSH key file you created, select the file and click **Open**.
9. Select a virtual cloud network, and then click **Create Instance**.

You should now see the NGC instance with the status of **Provisioning**. Once the status has changed to **Running**, you can connect to the instance. For general information about launching Compute instances, see Creating an Instance.

See the following topics for accessing and working with the instance:

- Connecting to an Instance
- Stopping and Starting an Instance
- Terminating an Instance

When you connect to the instance using SSH you will be prompted for the NGC API key. If you supply the API key at the prompt, the instance will automatically log you into the NGC container registry so that you can run containers from the registry. You can choose not to supply the API key at the prompt and still log in to the instance. You can then log in later to the NGC container registry, see Logging in to the NGC Container Registry for more information.

USING THE CLI

Oracle Cloud Infrastructure provides a Command Line Interface (CLI) you can use to complete tasks. For more information, see Quickstart and Configuration. Use the launch command to create an instance, specifying image for **sourceType** and the applicable image OCID from the table below for **imageId** in **InstanceSourceDetails** for **LaunchInstanceDetails**.

Region	Image OCID
us-ashburn-1	ocid1.image.oc1.iad.aaaaaaaaikn6ub6heefqxbe5fkiv4otbfe6ivza6y7di5khnkxkyvf2bkdta
eu-frankfurt-1	ocid1.image.oc1.eu-frankfurt-1.aaaaaaaauwuafl6uze6bnusphnn6y2mr5y7ajavx4kza7glyrqggxlnbo4zq

To start and stop the instance with the CLI, use the action command. Use the terminate command to terminate the instance.

Using the File Storage Service for Persistent Data Storage

You can use the Overview of File Storage for data storage when working with NGC. See the following tasks for creating and working with the File Storage service:

- Creating File Systems
- Using the Console
- Using the API
- Managing File Systems
- Using the Command Line Interface (CLI)

Using the Block Volume Service for Persistent Data Storage

You can use the Block Volume service for data storage when working with NGC. For more information, see Overview of Block Volume. See the following tasks for creating and working

with the Block Volume service:

- Creating a Volume
- Attaching a Volume
- Connecting to a Volume

You can also use the CLI to manage block volumes, see the volume commands.

Examples of Running Containers

You first need to log into the NGC container registry. You can skip this section if you provided your API key when logging into the instance via SSH. If you did not provide your API key when connecting to your instance, then you must perform this step.

To log into the NGC container registry

1. Run the following Docker command:

```
docker login nvcr.io
```

2. When prompted for a username, enter `$oauthtoken`.
3. When prompted for a password enter your NGC API key.

At this point you can run Docker commands and access the NGC container registry from the instance.

Example: MNIST Training Run Using PyTorch Container

This sample demonstrates running the MNIST example under PyTorch. This example downloads the MNIST dataset from the web.

1. Pull and run the PyTorch container with the following Docker commands:

```
docker pull nvcr.io/nvidia/pytorch:17.10
nvidia-docker run --rm -it nvcr.io/nvidia/pytorch:17.10
```

2. Run the MNIST example with the following commands:

```
cd /opt/pytorch/examples/mnist
python main.py
```

Example: MNIST Training Run Using TensorFlow Container

This sample demonstrates running the MNIST example under TensorFlow. This example downloads the MNIST dataset from the web.

1. Pull and run the TensorFlow container with the following Docker commands:

```
nvcr.io/nvidia/tensorflow:17.10
nvidia-docker run --rm -it nvcr.io/nvidia/tensorflow:17.10
```

2. Run the MNIST_with_summaries example with the following commands:

```
cd /opt/tensorflow/tensorflow/examples/tutorials/mnist
python mnist_with_summaries.py
```

Compute Shapes

A shape is a template that determines the number of CPUs, amount of memory, and other resources allocated to a newly created instance. The following lists provide basic information about the available bare metal and VM shapes.

Bare Metal Shapes

Shape	Instance Type	OCPU	Memory (GB)	Local Disk	Network Bandwidth[1]	Max VNICs Total: Linux	Max VNICS Total: Windows
BM.Standard1.36[2]	Standard compute capacity	36	256	Block storage only	10 Gbps	36	1
BM.DenseIO1.36[2]	Dense I/O compute capacity	36	512	28.8 TB NVMe SSD (9 drives)	10 Gbps	36	1
BM.Standard2.52	X7-based standard compute capacity	52	768	Block storage only	2 x 25 Gbps	52 total (26 per physical NIC)	27 total (1 on the first physical NIC, 26 on the second)

Shape	Instance Type	OCPU	Memory (GB)	Local Disk	Network Bandwidth[1]	Max VNICs Total: Linux	Max VNICS Total: Windows
BM.DenseIO2.52	X7-based dense I/O compute capacity	52	768	51.2 TB NVMe SSD (8 drives)	2 x 25 Gbps	52 total (26 per physical NIC)	27 total (1 on the first physical NIC, 26 on the second)
BM.GPU2.2	X7-based GPU: 2xP100 NVIDIA GPUs	28	192	Block storage only	2 x 25 Gbps	28	15 (1 on the first physical NIC, 14 on the second)
BM.GPU3.8	X7-based GPU: 8xV100 NVIDIA GPUs	52	768	Block storage only	2 x 25 Gbps	52	27 (1 on the first physical NIC, 26 on the second)

Shape	Instance Type	OCPU	Memory (GB)	Local Disk	Network Bandwidth[1]	Max VNICs Total: Linux	Max VNICS Total: Windows
BM.Standard.E2.64	E1-based standard compute capacity: AMD CPUs	64	512	Block storage only	2 x 25 Gbps	75	76 (1 on the first physical NIC, 75 on the second)
BM.HPC2.36	X7-based high frequency compute capacity	36	384	6.7 TB NVMe SSD (1 drive)	1 x 25 Gbps 1 x 100 Gbps RDMA	50	1
1: Network bandwidth is based on expected bandwidth for traffic within a VCN. 2: X5-based shapes availability is limited to monthly universal credit customers existing on or before November 9th, 2018, in the us-phoenix-1, us-ashburn-1, and eu-frankfurt-1 regions.							

VM Shapes

Shape	OCPU	Memory (GB)	Local Disk (TB)	Network Bandwidth [1]	Max VNICs Total: Linux	Max VNICs Total: Windows
VM.Standard1.1[2]	1	7	Block Storage only	Up to 600 Mbps	2	1
VM.Standard1.2[2]	2	14	Block Storage only	Up to 1.2 Gbps	2	1
VM.Standard1.4[2]	4	28	Block Storage only	1.2 Gbps	4	1
VM.Standard1.8[2]	8	56	Block Storage only	2.4 Gbps	8	1
VM.Standard1.16[2]	16	112	Block Storage only	4.8 Gbps	16	1
VM.DenseIO1.4[2]	4	60	3.2 TB NVMe SSD	1.2 Gbps	4	1
VM.DenseIO1.8[2]	8	120	6.4 TB NVMe SSD	2.4 Gbps	8	1
VM.DenseIO1.16[2]	16	240	12.8 TB NVMe SSD	4.8 Gbps	16	1
VM.Standard2.1	1	15	Block Storage only	1 Gbps	2	2
VM.Standard2.2	2	30	Block Storage only	2 Gbps	2	2

Shape	OCPU	Memory (GB)	Local Disk (TB)	Network Bandwidth [1]	Max VNICs Total: Linux	Max VNICs Total: Windows
VM.Standard2.4	4	60	Block Storage only	4.1 Gbps	4	4
VM.Standard2.8	8	120	Block Storage only	8.2 Gbps	8	8
VM.Standard2.16	16	240	Block Storage only	16.4 Gbps	16	16
VM.Standard2.24	24	320	Block Storage only	24.6 Gbps	24	24
VM.Standard.E2.1	1	8	Block Storage only	700 Mbps	2	2
VM.Standard.E2.2	2	16	Block Storage only	1.4 Gbps	2	2
VM.Standard.E2.4	4	32	Block Storage only	2.8 Gbps	4	4
VM.Standard.E2.8	8	64	Block Storage only	5.6 Gbps	4	4
VM.DenseIO2.8	8	120	6.4 TB NVMe SSD	8.2 Gbps	8	8
VM.DenseIO2.16	16	240	12.8 TB NVMe SSD	16.4 Gbps	16	16

Shape	OCPU	Memory (GB)	Local Disk (TB)	Network Bandwidth [1]	Max VNICs Total: Linux	Max VNICs Total: Windows
VM.DenseIO2.24	24	320	25.6 TB NVMe SSD	24.6 Gbps	24	24
VM.GPU2.1 (GPU: 1xP100)	12	72	Block Storage only	8 Gbps	12	12
VM.GPU3.1 (GPU: 1xV100)	6	90	Block Storage only	4 Gbps	6	6
VM.GPU3.2 (GPU: 2xV100)	12	180	Block Storage only	8 Gbps	12	12
VM.GPU3.4 (GPU: 4xV100)	24	360	Block Storage only	24.6 Gbps	24	24

1: Network bandwidth is based on expected bandwidth for traffic within a VCN.

2: X5-based shapes availability is limited to monthly universal credit customers existing on or before November 9th, 2018, in the us-phoenix-1, us-ashburn-1, and eu-frankfurt-1 regions.

Installing and Running Oracle Ksplice

Oracle Ksplice enables you to apply important security and other critical kernel updates without a reboot. For more information, see About Oracle Ksplice and Ksplice Overview.

This topic describes how to install and configure Ksplice. Ksplice is only available for Oracle Linux instances launched on or after February 15, 2017. It is installed on instances launched on or after August 25, 2017, so you just need to run it on these instances to install the

available Ksplice patches. For instances launched prior to August 25, 2017, you must install it prior to running it.

Installing Ksplice on instances launched prior to August 25 2017

To install Ksplice you need to connect to your Linux instance by using a Secure Shell (SSH). See Connecting to an Instance for more information.

1. Use the following SSH command to access the instance.

   ```
   ssh -l opc@<public-ip-address>
   ```

   <public-ip-address> is your instance IP address that you retrieved from the Console, see Getting the Instance Public IP Address.

2. Run the following SSH commands to sudo to the root:

   ```
   sudo bash
   ```

3. Download the Ksplice installation script with the following SSH command:

   ```
   wget -N https://www.ksplice.com/uptrack/install-uptrack-oc
   ```

4. Once the script is downloaded, use the following SSH command to install Ksplice:

   ```
   sh install-uptrack-oc
   ```

Running Ksplice

To run Ksplice you need to connect to your Linux instance by using a Secure Shell (SSH). See Connecting to an Instance for more information.

1. Use the following SSH command to access the instance.

   ```
   ssh -l opc <public-ip-address>
   ```

   <public-ip-address> is your instance IP address that you retrieved from the Console, see Getting the Instance Public IP Address.

2. Run the following SSH commands to sudo to the root:

```
sudo bash
cd
```

3. To install available Ksplice patches, run the following SSH command:

```
uptrack-upgrade
```

Automatic Updates

You can configure automatic updates by setting the value of `autoinstall` to `yes` in `/etc/uptrack/uptrack.conf`.

Note

OS Security Updates for Oracle Linux images

Oracle Linux images are updated regularly with the necessary patches, but after you launch an instance using these images, you are responsible for applying the required OS security updates published through the Oracle public Yum server. For more information, see Installing and Using the Yum Security Plugin.

Managing Custom Images

Oracle Cloud Infrastructure uses images to launch instances. You specify an image to use when you launch an instance.

You can create a custom image of a bare metal instance's boot disk and use it to launch other instances. Instances you launch from your image include the customizations, configuration, and software installed when you created the image.

For details on Windows images, see Creating Windows Custom Images.

Custom images do not include the data from any attached block volumes. For information about backing up volumes, see Backing Up a Volume.

Tip

Oracle Cloud Infrastructure runs on Oracle's high-quality Sun servers. However, any hardware can experience a failure. Follow industry-wide hardware failure best practices to ensure the resilience of your solution. Some best practices include:

- Design your system with redundant compute nodes in different availability domains to support fail-over capability.
- Create a custom image of your system drive each time you change the image.
- Back up your data drives, or sync to spare drives, regularly.

If you experience a hardware failure and have followed these practices, you can terminate the failed instance, launch your custom image to create a new instance, and then apply the backup data.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to create and manage images. If the specified group doesn't need to launch instances or attach

volumes, you could simplify that policy to include only `manage instance-family`, and remove the statements involving `volume-family` and `virtual-network-family`.

Tip

When users create a custom image from an instance or launch an instance from a custom image, the instance and image don't have to be in the same compartment. However, users must have access to both compartments.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Limitations and Considerations

- Certain IP addresses are reserved for Oracle Cloud Infrastructure use and may not be used in your address numbering scheme. See IP Addresses Reserved for Use by Oracle for more information.
- Before you create a custom image of an instance, you must disconnect all iSCSI attachments and remove all iscsid node configurations from the instance. For steps, see Disconnecting From a Volume.
- When you create an image of a running instance, the instance shuts down and remains unavailable for several minutes. The instance restarts when the process completes.
- You cannot create additional custom images of an instance while the instance is engaged in the image creation process. When you start to create a custom image, the system implements a 20-minute timeout, during which you cannot create another image of the same instance. You can, however, create images of different instances at the same time.

- Custom images are available to all users authorized for the compartment in which the image was created.
- The maximum size for creating a custom image is 300 GB.
- The maximum size for importing a custom image is 300 GB.
- The maximum size for custom exported images is 50 GB.
- You can create a maximum of 25 custom images per region per root compartment.
- You cannot create an image of an Oracle Database instance.
- Windows custom images cannot be exported or downloaded.
- If you use a custom image and update the OS kernel on your instance, you must also upload the update to the network drive. See OS Kernel Updates for more information.

For information about how to deploy any version of any operating system that is supported by the Oracle Cloud Infrastructure hardware, see Bring Your Own Image (BYOI).

X5 and X7 Compatibility for Custom Images

Oracle X5 and X7 servers have different host hardware. As a result, using an X5 image on an X7 bare metal or virtual machine (VM) instance may not work without additional modifications. Oracle Cloud Infrastructure recommends for X7 hosts that you use the Oracle-provided images for X7. See Oracle-Provided Image Release Notes for more information about which images support X7. These images have been explicitly created and tested with the new hardware.

If you do attempt to use an existing X5 image on X7 hardware, note that CentOS 6 and all Windows versions are not cross-compatible.

Oracle Linux, Ubuntu 16.04, Ubuntu 14.04, and CentOS 7 are cross-compatible, however you need to update the kernel to the most recent version to install the latest device drivers. To do so, run the following commands from a terminal session:

- **Oracle Linux**

```
yum update
```

- **CentOS 7**

```
yum update
```

- **Ubuntu 16.04**

```
apt-get update
apt-get dist-upgrade
```

- **Ubuntu 14.04**

```
apt-get update
apt-get dist-upgrade
apt-get install linux-hwe-generic-trusty
```

The primary device drivers that are different between X5 and X7 hosts are:

- Network device drivers
- NVMe drive device drivers
- GPU device drivers

Additional updates may be required depending on how you have customized the image.

Using the Console

To access the Console, you must use a supported browser.

To create a custom image

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. Find the instance you want to use as the basis for an image.
3. Click the Actions icon (three dots), and then click **Create Custom Image**.
4. Enter a name for the image, and then click **Create Custom Image**. You can use the API to change the name later, if needed. You cannot use an Oracle-provided image name as a custom image name.

Note

Limits

If you see a message indicating that you are at the limit for custom images, you must delete at least one image before you can create another. Or, you can request a service limit increase.

To launch an instance from a custom image

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Custom Images**. Find the custom image you want to use.
2. Click the Actions icon (three dots), and then click **Create Instance**.
3. Provide additional launch options as described in Creating an Instance.

To edit custom image details

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Custom Images**.
2. Click the custom image you want to edit.
3. Click **Edit**
4. From the **Edit Image Details** dialog box, you can change the name, or add and remove compatible shapes for the custom image.
5. After you have finished editing the details, click **Save** to save your changes and close the dialog box.

To manage tags for a custom image

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Custom Images**.
2. Click the custom image you want to manage the tags for.
3. Click the **Tags** tab to view or edit the existing tags. Or click **Apply tag(s)** to add new ones.

For more information, see Resource Tags.

To delete a custom image

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Custom Images**.
2. Find the custom image you want to delete.
3. Click the Actions icon (three dots), and then click **Delete**.
4. Confirm when prompted.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations to manage custom images:

- DeleteImage
- GetImage
- ListImages
- CreateImage
- UpdateImage

Creating Windows Custom Images

You can create a Windows custom image of a bare metal or VM instance's boot disk and use it to launch other instances. Instances you launch from your image include the customizations, configuration, and software installed when you created the image. For information about using the Console to manage custom images, see Managing Custom Images.

Windows supports two kinds of images: generalized and specialized. Generalized images are images that have been cleaned of instance-specific information. Specialized images are point-in-time snapshots of the boot disk of a running instance, and are useful for creating backups of an instance. Oracle Cloud Infrastructure supports bare metal and VM instances launched from both generalized and specialized custom Windows images.

Generalized images

A generalized image has a generalized OS disk, cleaned of computer-specific information. The images are generalized using Sysprep. Generalized images can be useful in scenarios such as quickly scaling an environment. Generalized images can be configured to preserve the existing `opc` user's account, including the password, at the time the image is created, or configured to recreate the `opc` user account, including generating a new, random password that you retrieve using the API. For background information, see Sysprep (Generalize) a Windows installation.

Specialized images

A specialized image has an OS disk that is already fully installed, and is essentially a copy of the original bare metal or VM instance. Specialized images are intended to be used for backups so that you can recover from a failure. Specialized images are useful when you are testing a task and may need to roll back to known good configuration. Specialized images are not recommended for cloning multiple identical Bare Metal instances or VMs in the same network because of issues with multiple computers having the same computer name and ID. When creating a specialized image, you must remember the `opc` user's password; a new password is not generated when the instance launches, and it cannot be retrieved from the console or API.

Creating a Generalized Image

Warning

Creating a generalized image from an instance will render the instance non-functional, so you should first create a custom image from the instance, and then launch a new instance from the custom image. Steps 1 - 2 describe how to do this. This is the instance that you'll generalize. Alternatively, you can make a backup image of the instance that you can use to launch a replacement instance if needed.

Warning

If you upgrade to PowerShell 5.0/WMF 5.0, you may encounter an issue where **Sysprep** fails which will prevent the image generalization process from completing. If this occurs, you may not be able to log into instances launched from the custom image. See Unable to log into instance launched from new Windows custom image for more information and how to workaround the issue.

1. Create the new image using To create a custom image.
2. Launch an instance from the new image using To launch an instance from a custom image.
3. Connect to the instance using a Remote Desktop client.
4. Go to Windows Generalized Image Support Files and download to the instance the file matching the Windows version for the instance.
5. Right-click the file, and then click **Run as administrator**.

6. Extract the files to **C:\Windows\Panther**. The following files are extracted into the Panther folder for all Windows Server versions:
   - Generalize.cmd
   - Specialize.cmd
   - unattend.xml
   - Post-Generalize.ps1

   For Windows Server 2008, the following file is also extracted into the Panther folder:
   - Windows2008-SnapshotUtilities.ps1
7. Optional: If you want to preserve the `opc` user account, edit `C:\Program Files\bmcs\imageType.json` and change the `imageType`setting to `custom`. A new password is not created and the password is not retrievable from the console or API. If you want to configure the generalized image to recreate the `opc` user account when a new instance is launched from the image, leave the `imageType` setting defaulted to `general`. The new account's password can be retrieved through the API using `GetWindowsInstanceInitialCredentials`.
8. Right-click **Generalize.cmd**, and then click **Run as administrator**. Keep in mind the following outcomes of running this command:
   - Your connection to the Remote Desktop client may immediately be turned off and you will be logged out of the instance. If this does not occur, you should log out of the instance yourself.
   - Because `sysprep generalize` turns off Remote Desktop, you won't be able to log in to the instance again.
   - Creating a generalized image essentially destroys the instance's functionality.

   You should wait for a few minutes before proceeding to step 9 to ensure the generalization process has completed.
9. Create the new image using To create a custom image.
10. After you create an image from an instance that has been generalized, Oracle recommends that you terminate that instance. Although it may appear to be running, it won't be fully operable.

Creating a Specialized Image

Important

When creating a specialized image, you must remember the `opc` user's password. It cannot be retrieved from the Console or API.

You create a specialized image the same way you create other custom images. For step-by-step instructions, see Managing Custom Images.

Image Import/Export

Oracle Cloud Infrastructure Compute enables you to share custom images across tenancies and regions using image import/export.

Linux-Based Operating Systems

The following Oracle Cloud Infrastructure operating systems support image import/export:

- Oracle Linux 6, Oracle Linux 7
- CentOS 6, CentOS 7
- Ubuntu 16.04, Ubuntu 14.04

For more information about these images, see Oracle-Provided Images.

Windows-Based Operating Systems

You can import custom Windows images. The following operating systems are supported:

- Windows Server 2008 R2 Standard, Enterprise, and Datacenter
- Windows Server 2012 Standard, Datacenter

- Windows Server 2012 R2 Standard, Datacenter
- Windows Server 2016 Standard, Datacenter

Verify Your Windows Operating System

When importing custom Windows images, you need to make sure that the version you select matches up with the Windows image that you imported. Failure to provide the correct version and SKU information could be a violation of your Microsoft Licensing Agreement.

Windows System Time Issue on Custom Windows Instances

If you change the time zone from the default setting on Windows VM instances, when the instance reboots or syncs with the hardware clock, the system time will revert back to the time for the default time zone. However, the time zone setting will stay set to the new time zone, so the system clock will be incorrect. You can fix this by setting the `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\TimeZoneInformation` registry key to 1.

OCI-provided Windows Images already have the `RealTimeIsUniversal` registry key set by default, but you will need to do this for any custom Windows images that you import.

To fix this issue for custom Windows images:

1. Open the Windows Registry Editor and navigate to the `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\TimeZoneInformation` registry key.
2. Create a new `DWORD` key named `RealTimeIsUniversal` and set the value to 1.
3. Reboot the instance.
4. Reset the time and time zone manually.

Exporting Windows Images

Image export is not supported for Windows images.

Bring Your Own Image Scenarios

You can also use image import/export to share custom images from Bring Your Own Image (BYOI) scenarios across tenancies and regions, so you don't need to re-create the image

manually in each region. You need to go through the steps required to manually create the image in one of the regions, but after this is done, you can export the image, making it available for import in additional tenants and regions. The exported image format is OCI, which is a TAR file that contains a QCOW2 file and Oracle Cloud Infrastructure-specific metadata.

Best practices for replicating an image across regions

You can use the Console or API to replicate an image from one region to other regions. At a high level:

1. Export the image to an Object Storage bucket in the same region as the image. For steps, see Exporting an Image.
2. Create a pre-authenticated request with read-only access for the exported image. For steps, see Working with Pre-Authenticated Requests.
3. Import the image to each region that you want to replicate it in. Use the pre-authenticated request URL as the Object Storage URL. For steps, see Importing an Image.

Object Storage Service URLs

When you import or export custom images using the Console, you may need to specify the Object Storage URL pointing to the location that you want to import the image from or export the image to. Object Storage URLs are structured as follows:

```
https://<host_name>/n/<namespace_name>/b/<bucket_name>/o/<object_name>
```

For example:

```
https://objectstorage.us-phoenix-1.oraclecloud.com/n/MyNamespace/b/MyBucket/o/MyCustomImage.qcow2
```

Pre-Authenticated Requests

When using import/export across tenants and regions you need to use an Object Storage pre-authenticated request. See Working with Pre-Authenticated Requests for instructions on creating a pre-authenticated request. When you go through these instructions, after you click

Create Pre-Authenticated Request, the **Pre-Authenticated Request Details** dialog opens. You need to make a copy of the pre-authenticated request URL displayed here, as this is the only time this will be displayed. This is the Object Storage URL you specify for import/export.

Note

Pre-authenticated requests for a bucket

With image export, if you create the pre-authenticated request for a bucket, you will need to append the object name to the generated URL. For example:

```
/o/MyCustomImage.qcow2
```

Exporting an Image

You can use the Console or API to export images, and the exported images are stored in the Oracle Cloud Infrastructure Object Storage service. To perform an image export, you need write access to the Object Storage bucket for the image. For more information, see Overview of Object Storage and Let users write objects to Object Storage buckets.

To export an image using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Custom Images**.
2. Find the custom image you want to export, click the Actions icon (three dots), and then click **Export Image**.
3. In the **Export Image** dialog box, specify the Object Storage location to export the image to. You have two options here: You can select a compartment and bucket, and then enter a name for the exported image, or you can enter the Object Storage URL.
4. Click **Export Image**.

After you click **Export Image**, the image status changes to **EXPORTING**. You can still launch instances while the image is exporting, but you can't delete the image until the export has finished. When the export is complete, the image status changes to **AVAILABLE**. If the image status changes to **AVAILABLE**, but you don't see the exported image in the Object Storage location you specified, this means that the export failed, and you will need to go through the steps again to export the image.

Importing an Image

You can use the Console or API to import exported images from Object Storage. To import an image, you need read access to the Object Storage object containing the image. For more information, see Let users download objects from Object Storage buckets.

To import an image using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Custom Images**.
2. Click **Import Image**.
3. Select the compartment name you want to import the image to.
4. Enter a name for the image.
5. Select the operating system.
6. Specify the Object Storage URL where the image is stored. When importing across regions or tenancies, you need to specify a pre-authenticated request URL.
7. Select the image type.
8. Select the launch mode.
    - For custom images where the image format is OCI, Oracle Cloud Infrastructure selects the applicable launch mode based on the launch mode for the source image.
    - For custom images exported from Oracle Cloud Infrastructure where the image type is QCOW2, select **Native Mode**.

- To import other custom images select **Paravirtualized Mode** or **Emulated Mode**. For more information, see Bring Your Own Image (BYOI).

9. Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
10. Click **Import Image**.

After you click **Import Image**, you'll see the imported image in the **Custom Images** list for the compartment, with a status of **IMPORTING**. When the import completes successfully, the status changes to **AVAILABLE**. If the status does not change, or no entry appears in the **Custom Images** list, the import failed. If the import failed, make sure you have read access to the Object Storage object, and that the object contains a supported image.

Editing Image Details

You can edit the details of custom images, such as the image name and compatible shapes for the image. For more information, see To edit custom image details in Managing Custom Images.

Managing Tags for an Image

You can apply tags to your resources, such images, to help you organize them according to your business needs. You can apply tags at the time you import an image, or you can update the image later with the desired tags.

To manage tags for an image

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Custom Images**.
2. Click the image you're interested in.

3. Click the **Tags** tab to view or edit the existing tags. Or click **Apply tag(s)** to add new ones.

For more information, see Resource Tags.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following API operations for custom image import/export:.

- ExportImage: Exports a custom image to Object Storage.
- CreateImage: To import an exported image, specify ImageSourceDetails in the request body.

X5 and X7 Compatibility for Image Import/Export

Oracle X5 and X7 servers have different host hardware. As a result, using an X5 image on an X7 bare metal or virtual machine (VM) instance may not work without additional modifications. Oracle Cloud Infrastructure recommends for X7 hosts that you use the Oracle-provided images for X7. See Oracle-Provided Image Release Notes for more information about which images support X7. These images have been explicitly created and tested with the new hardware.

If you do attempt to use an existing X5 image on X7 hardware, note that CentOS 6 and all Windows versions are not cross-compatible.

Oracle Linux, Ubuntu 16.04, Ubuntu 14.04, and CentOS 7 are cross-compatible, however you need to update the kernel to the most recent version to install the latest device drivers. To do so, run the following commands from a terminal session:

- **Oracle Linux**

```
yum update
```

- **CentOS 7**

```
yum update
```

- **Ubuntu 16.04**

```
apt-get update
apt-get dist-upgrade
```

- **Ubuntu 14.04**

```
apt-get update
apt-get dist-upgrade
apt-get install linux-hwe-generic-trusty
```

The primary device drivers that are different between X5 and X7 hosts are:

- Network device drivers
- NVMe drive device drivers
- GPU device drivers

Additional updates may be required depending on how you have customized the image.

Bring Your Own Image (BYOI)

The Bring Your Own Image (BYOI) feature enables you to bring your own versions of operating systems to the cloud as long as the underlying hardware supports it. The services do not depend on the OS you run.

The BYOI feature:

- Enables lift-and-shift cloud migration projects.
- Supports both old and new operating systems.
- Encourages experimentation.
- Increases infrastructure flexibility.

Note

Licensing Requirements

You must comply with all licensing requirements when you upload and start instances based on OS images that you supply.

Bringing Your Own Image

A critical part of any lift-and-shift cloud migration project is the migration of on-premises virtual machines (VMs) to the cloud. You can import your on-premises virtualized root volumes to Oracle Cloud Infrastructure using the custom image import feature, and then launch Compute instances using those images.

You can import Windows and Linux-based custom images.

- **Windows images**
  These Windows versions support custom image import:
  - Windows Server 2008 R2 Standard, Enterprise, Datacenter
  - Windows Server 2012 Standard, Datacenter
  - Windows Server 2012 R2 Standard, Datacenter
  - Windows Server 2016 Standard, Datacenter

  For steps to import a Windows image, see Importing Custom Windows Images.
- **Linux images**

These Linux distributions support custom image import:

Linux Distribution	Supported Versions	Preferred Launch Mode
RHEL	7 or later	Paravirtualized
	4.5, 5.9, 5.11, 6.9	Emulated
CentOS	7 or later	Paravirtualized
	4.0, 4.8, 5.11, 6.9	Emulated
Oracle Linux	7 or later	Paravirtualized
	4.5, 4.8, 5.8, 5.11, 6.2, 6.5	Emulated
Ubuntu	13.04 or later	Paravirtualized
	12.04	Emulated
FreeBSD	12 or later	Paravirtualized
	8, 9, 10, 11	Emulated
Debian	8 or later	Paravirtualized
	5.0.10, 6.0, 7	Emulated
SUSE	12.2 or later	Paravirtualized
	11, 12.1	Emulated

You might also have success importing other distributions of Linux.
For steps to import a Linux-based image, see Importing Custom Linux Images.

Bringing Your Own Hypervisor

- **Bring Your Own KVM:** You can bring your own operating system images or older operating systems such as Ubuntu 6.x, RHEL 3.x, CentOS 5.4 using KVM on bare metal instances. For more information, see Getting Started: Oracle Linux KVM Image for Oracle Cloud Infrastructure and Installing and Configuring KVM on Bare Metal Instances with Multi-VNIC.
- **Bring your own OVM:** You can bring your Oracle VM workload to Oracle Cloud Infrastructure. For more information, see Installing and Configuring Oracle VM on Oracle Cloud Infrastructure.
- **Bring your own Hyper-V:** You can bring your own operating system images or older operating systems such as Windows Server 2003, Windows Server 2008, and older Linux -based operating systems using Hyper-V on bare metal instances. For a full list of supported Hyper-V guests, see Supported Windows guest operating systems for Hyper-V on Windows Server and Supported Linux and FreeBSD virtual machines for Hyper-V on Windows. See Deploying Hyper-V on Oracle Cloud Infrastructure for more information.

Importing Custom Windows Images

The Compute service enables you to import Windows images that were created outside of Oracle Cloud Infrastructure. For example, you can import images running on your on-premises physical or virtual machines (VMs), or VMs running in Oracle Cloud Infrastructure Classic. You can then launch your imported images on Compute virtual machines.

Supported Operating Systems

These Windows versions support custom image import:

- Windows Server 2008 R2 Standard, Enterprise, Datacenter
- Windows Server 2012 Standard, Datacenter
- Windows Server 2012 R2 Standard, Datacenter
- Windows Server 2016 Standard, Datacenter

Note

- Oracle Cloud Infrastructure has tested the operating systems listed previously and will support customers in ensuring that instances launched from these images and built according to the guidelines in this topic are accessible using RDP.
- For OS editions not listed previously, Oracle Cloud Infrastructure will provide commercially reasonable support to customers in an effort to get instances that are launched from these images accessible via RDP.
- Support from Oracle Cloud Infrastructure in launching an instance from a custom OS does not ensure that the operating system vendor also supports the instance.

Windows Source Image Requirements

Custom images must meet the following requirements:

- The maximum image size is 300 GB.
- The image must be set up for BIOS boot.
- Only one disk is supported, and it must be the boot drive with a valid master boot record (MBR) and boot loader. You can migrate additional data volumes after you import the image's boot volume.
- The boot process must not require additional data volumes to be present for a successful boot.
- The disk image cannot be encrypted.

- The disk image must be a VMDK or QCOW2 file.
    - Create the image file by cloning the source volume, not by creating a snapshot.
    - VMDK files must be either the "single growable" (monolithicSparse) type or the "stream optimized" (streamOptimized) type, both of which consist of a single VMDK file. All other VMDK formats, such as those that use multiple files, split volumes, or contain snapshots, are not supported.
- The network interface must use DHCP to discover the network settings. When you import a custom image, existing network interfaces are not recreated. Any existing network interfaces are replaced with a single NIC after the import process is complete. You can attach additional VNICs after you launch the imported instance.
- The network configuration must not hardcode the MAC address for the network interface.

Preparing Windows VMs for Import

Before you can import a custom Windows image, you must prepare the image to ensure that instances launched from the image can boot correctly and that network connections will work.

You can perform the tasks described in this section on the running source system. If you have concerns about modifying the live source system, you can export the image as-is, import it into Oracle Cloud Infrastructure, and then launch an instance based on the custom image. You can then connect to the instance using the VNC console and perform the preparation steps.

Important

The system drive where Windows is installed will be imported to Oracle Cloud Infrastructure. All partitions on the drive will follow through the imported image. Any other drives will not be imported and you must re-create them on the instance after import. You will then need to manually move the data on the non-system drives.

To prepare a Windows VM for import:

1. Follow your organization's security guidelines to ensure that the Windows system is secured. This can include, but is not limited to the following tasks:
    - Install the latest security updates for the operating system and installed applications.
    - Enable the firewall, and configure it so that you only enable the rules which are needed.
    - Disable unnecessary privileged accounts.
    - Use strong passwords for all accounts.
2. Configure Remote Desktop Protocol (RDP) access to the image:
    a. Enable Remote Desktop connections to the image.
    b. Modify the Windows Firewall inbound port rule to allow RDP access for both Private and Public network location types. When you import the image, the Windows Network Location Awareness service will identify the network connection as a Public network type.
3. Determine whether the current Windows license type is a volume license by running the following command in PowerShell:

    ```
    Get-CimInstance -ClassName SoftwareLicensingProduct | where {$_.PartialProductKey} | select ProductKeyChannel
    ```

    If the license is not a volume license, after you import the image, you will update the license type.
4. If you plan to launch the imported image on more than one VM instance, create a generalized image of the boot disk. A generalized image is cleaned of computer-specific information, such as unique identifiers. When you create instances from a generalized image, the unique identifiers are regenerated. This prevents two instances that are created from the same image from colliding on the same identifiers.
5. Create a backup of the root volume.
6. If the VM has remotely attached storage, such as NFS or block volumes, configure any services that rely on this storage to start manually. Remotely attached storage is not

available the first time that an imported instance boots on Oracle Cloud Infrastructure.

7. Ensure that all network interfaces use DHCP, and that the MAC address and IP addresses are not hardcoded. See your system documentation for steps to perform network configuration for your system.
8. Download the Oracle Windows VirtIO drivers:
    a. Log in to the Oracle Software Delivery Cloud site.
    b. In the **All Categories** list, select **Release**.
    c. Type **Oracle Linux 7.6** in the search box and click **Search**.
    d. Add **REL: Oracle Linux 7.6.x** to your cart, and then click **Checkout**.
    e. In the **Platforms/Languages** list, select **x86 64 bit**. Click **Continue**.
    f. Accept the license agreement and then click **Continue**.
    g. Select the check box next to **Oracle VirtIO Drivers Version for Microsoft Windows 1.1.3**. Clear the other check boxes.
    h. Click **Download** and then follow the prompts.

9. Install the Oracle VirtIO drivers for Windows:
    a. Follow the prompts in the installation wizard. On the **Installation Type** page, select **Custom**, as shown in the following screenshot.

    b. Reboot the VM.
10. Stop the VM.
11. Clone the stopped VM as a VMDK or QCOW2 file, and then export the image from your virtualization environment. See the tools documentation for your virtualization environment for steps.

Importing a Windows-Based VM

After you prepare a Windows image for import, follow these steps to import the image:

1. Upload the VMDK or QCOW2 file to Oracle Cloud Infrastructure:
   a. Upload the file to an Object Storage bucket. You can upload the file using the Console or using the command line interface (CLI). If you use the CLI, use the following command:

      ```
      oci os object put -bn <destination_bucket_name> --file <path_to_the_VMDK_or_QCOW2_file>
      ```

   b. Copy the URL of the file that you uploaded: On the **Bucket Details** page, click the the Actions icon (three dots) next to the file, and then click **Details**. Copy the **URL Path (URI)**.
2. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Custom Images**.
3. Click **Import Image**.
4. In the **Create in Compartment** list, select the compartment that you want to import the image to.
5. Enter a name for the image.
6. For the **Operating System**, select **Windows**.
7. In the **Operating System Version** list, select the version of Windows.
8. Confirm that you chose the operating system version that complies with your Microsoft licensing agreement, and then select the compliance check box.

   Important

   Failure to provide the correct version and SKU information could be a violation of your Microsoft Licensing Agreement.
9. In the **Object Storage URL** field, paste the URL of the file that you uploaded.

10. For the **Image Type**, select the file type of the image, either **VMDK** or **QCOW2**.
11. In the **Launch Mode** area, select **Paravirtualized Mode**.
12. **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
13. Click **Import Image**.
    The imported image appears in the **Custom Images** list for the compartment, with a status of **IMPORTING**. When the import completes successfully, the status changes to **AVAILABLE**.
    If the status doesn't change, or no entry appears in the **Custom Images** list, the import failed. Ensure that you have read access to the Object Storage object, and that the object contains a supported image.
14. Complete the post-import tasks.

Post-Import Tasks for Windows Images

After you import a custom Windows-based image, do the following:

1. Create an instance based on the custom image. For the image source, select **Custom Images**, and then select the image that you imported.
2. Enable Remote Desktop Protocol (RDP) access to the Compute instance.
3. Connect to the instance using RDP.
4. If the instance requires any remotely attached storage, such as block volumes or file storage, create and attach it.
5. Create and attach any required secondary VNICs.
6. Test that all applications are working as expected.
7. Reset any services that were set to start manually.

8. Register the instance with the Oracle-provided Key Management Service (KMS) server:
    a. On the instance, open PowerShell as Administrator.
    b. To set the KMS endpoint, run the following command:

```
slmgr /skms 169.254.169.253:1688
```

    c. If the Windows license type that you noted while preparing the image isn't a volume license, you must update the license type. Run the following command:

```
slmgr /ipk <setup key>
```

    <setup key> is the KMS client setup key that corresponds to the version of Windows that you imported:

Windows Version	KMS Client Setup Key
Windows Server 2008 R2 Standard	YC6KT-GKW9T-YTKYR-T4X34-R7VHC
Windows Server 2008 R2 Enterprise	489J6-VHDMP-X63PK-3K798-CPX3Y
Windows Server 2008 R2 Datacenter	74YFP-3QFB3-KQT8W-PMXWJ-7M648
Windows Server 2012 Standard	XC9B7-NBPP2-83J2H-RHMBY-92BT4
Windows Server 2012 Datacenter	48HP8-DN98B-MYWDG-T2DCC-8W83P
Windows Server 2012 R2 Standard	D2N9P-3P6X9-2R39C-7RTCD-MDVJX
Windows Server 2012 R2 Datacenter	W3GGN-FT8W3-Y4M27-J84CP-Q3VJ9
Windows Server 2016 Standard	WC2BQ-8NRM3-FDDYY-2BFGV-KHKQY
Windows Server 2016 Datacenter	CB7KF-BWN84-R7R2Y-793K2-8XDDG

    d. To activate Windows, run the following command:

```
slmgr /ato
```

e. To verify the license status, run the following command:

```
Get-CimInstance -ClassName SoftwareLicensingProduct | where {$_.PartialProductKey} |
select Description, LicenseStatus
```

If the `LicenseStatus` is `1`, the instance is properly licensed.

Importing Custom Linux Images

The Compute service enables you to import Linux-based images that were created outside of Oracle Cloud Infrastructure. For example, you can import images running on your on-premises physical or virtual machines (VMs), or VMs running in Oracle Cloud Infrastructure Classic. You can then launch your imported images on Compute virtual machines.

Supported Operating Systems

You can launch imported Linux VMs in either paravirtualized mode or emulated mode.

Paravirtualized mode offers better performance than emulated mode. We recommend that you use paravirtualized mode if your OS supports it. Linux-based operating systems running the kernel version 3.4 or later support paravirtualized drivers. You can verify your system's kernel version using the uname command.

To verify the kernel version using the uname command

Run the following command:

```
uname -a
```

The output should look similar to this sample:

```
Linux ip_bash 4.14.35-1818.2.1.el7uek.x86_64 #2 SMP Mon Aug 27 21:16:31 PDT 2018 x86_64 x86_64 x86_64
GNU/Linux
```

The kernel version is the number at the first part of output string. In the sample output shown previously, the version is 4.14.35.

These Linux distributions support custom image import:

Linux Distribution	Supported Versions	Preferred Launch Mode
RHEL	7 or later	Paravirtualized
	4.5, 5.9, 5.11, 6.9	Emulated
CentOS	7 or later	Paravirtualized
	4.0, 4.8, 5.11, 6.9	Emulated
Oracle Linux	7 or later	Paravirtualized
	4.5, 4.8, 5.8, 5.11, 6.2, 6.5	Emulated
Ubuntu	13.04 or later	Paravirtualized
	12.04	Emulated
FreeBSD	12 or later	Paravirtualized
	8, 9, 10, 11	Emulated
Debian	8 or later	Paravirtualized
	5.0.10, 6.0, 7	Emulated
SUSE	12.2 or later	Paravirtualized
	11, 12.1	Emulated

Note

- Oracle Cloud Infrastructure has tested the operating systems listed in the previous table and will support customers in ensuring that instances launched from these images and built according to the guidelines in this topic are accessible using SSH.
- For OS versions not listed in the previous table, Oracle Cloud Infrastructure will provide commercially reasonable support to customers in an effort to get instances that are launched from these images accessible via SSH.
- Support from Oracle Cloud Infrastructure in launching an instance from a custom OS does not ensure that the operating system vendor also supports the instance. Customers running Oracle Linux on Oracle Cloud Infrastructure automatically have access to Oracle Linux Premier Support.

Tip

If your image supports paravirtualized drivers, you can convert your existing emulated mode instances into paravirtualized instances. Create a custom image of your instance, export it to Object Storage, and then reimport it using paravirtualized mode.

Linux Source Image Requirements

Custom images must meet the following requirements:

- The maximum image size is 300 GB.
- The image must be set up for BIOS boot.
- Only one disk is supported, and it must be the boot drive with a valid master boot record (MBR) and boot loader. You can migrate additional data volumes after you import the image's boot volume.
- The boot process must not require additional data volumes to be present for a successful boot.
- The boot loader should use LVM or a UUID to locate the boot volume.
- The disk image cannot be encrypted.
- The disk image must be a VMDK or QCOW2 file.
    - Create the image file by cloning the source volume, not by creating a snapshot.
    - VMDK files must be either the "single growable" (monolithicSparse) type or the "stream optimized" (streamOptimized) type, both of which consist of a single VMDK file. All other VMDK formats, such as those that use multiple files, split volumes, or contain snapshots, are not supported.
- The network interface must use DHCP to discover the network settings. When you import a custom image, existing network interfaces are not recreated. Any existing network interfaces are replaced with a single NIC after the import process is complete. You can attach additional VNICs after you launch the imported instance.
- The network configuration must not hardcode the MAC address for the network interface.

We recommend that you enable certificate-based SSH, however this is optional. If you want your image to automatically use SSH keys supplied from the **User Data** field when you launch an instance, you can install cloud-init when preparing the image. See Creating an Instance for more information about the **User Data** field.

Preparing Linux VMs for Import

Before you import a custom Linux image, you must prepare the image to ensure that instances launched from the image can boot correctly and that network connections will work. Do the following:

1. Optionally, configure your Linux image to support serial console connections. A console connection can help you remotely troubleshoot malfunctioning instances, such as an imported image that does not complete a successful boot.
2. Create a backup of the root volume.
3. If the VM has remotely attached storage, such as NFS or block volumes, configure any services that rely on this storage to start manually. Remotely attached storage is not available the first time that an imported instance boots on Oracle Cloud Infrastructure.
4. Ensure that all network interfaces use DHCP, and that the MAC address and IP addresses are not hardcoded. See your system documentation for steps to perform network configuration for your system.
5. Stop the VM.
6. Clone the stopped VM as a VMDK or QCOW2 file, and then export the image from your virtualization environment. See the tools documentation for your virtualization environment for steps.

Importing a Linux-Based VM

After you prepare a Linux image for import, follow these steps to import the image:

1. Upload the VMDK or QCOW2 file to Oracle Cloud Infrastructure:
   a. Upload the file to an Object Storage bucket. You can upload the file using the Console or using the command line interface (CLI). If you use the CLI, use the following command:

```
oci os object put -bn <destination_bucket_name> --file <path_to_the_VMDK_or_QCOW2_file>
```

b. Copy the URL of the file that you uploaded: On the **Bucket Details** page, click the the Actions icon (three dots) next to the file, and then click **Details**. Copy the **URL Path (URI)**.

2. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Custom Images**.
3. Click **Import Image**.
4. In the **Create in Compartment** list, select the compartment that you want to import the image to.
5. Enter a name for the image.
6. For the **Operating System**, select **Linux**.
7. In the **Object Storage URL** field, paste the URL of the file that you uploaded.
8. For the **Image Type**, select the file type of the image, either **VMDK** or **QCOW2**.
9. Depending on your image's version of Linux, in the **Launch Mode** area, select **Paravirtualized Mode** or **Emulated Mode**. If your image supports paravirtualized drivers, we recommend that you select paravirtualized mode.
10. **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
11. Click **Import Image**.

    The imported image appears in the **Custom Images** list for the compartment, with a status of **IMPORTING**. When the import completes successfully, the status changes to **AVAILABLE**.

    If the status doesn't change, or no entry appears in the **Custom Images** list, the import failed. Ensure that you have read access to the Object Storage object, and that the object contains a supported image.
12. Complete the post-import tasks.

Post-Import Tasks for Linux Images

After you import a custom Linux-based image, do the following:

1. Create an instance based on the custom image. For the image source, select **Custom Images**, and then select the image that you imported.
2. Connect to the instance using SSH.
3. If the instance requires any remotely attached storage, such as block volumes or file storage, create and attach it.
4. Create and attach any required secondary VNICs.
5. Test that all applications are working as expected.
6. Reset any services that were set to start manually.
7. If you enabled serial console access to the image, test it by creating a serial console connection to the instance.

See the current issues and workarounds for known issues with imported custom images.

Enabling Serial Console Access for Imported Linux Images

You can configure your custom Linux image to support connections using the serial console feature in the Compute service.

For more information about serial console connections, and steps to troubleshoot if your image has network connectivity issues after it is launched, see Instance Console Connections.

The serial console connection in Oracle Cloud Infrastructure uses the first serial port, ttyS0, on the VM. The boot loader and the operating system should be configured to use ttyS0 as a console terminal for both input and output.

Configuring the Boot Loader

The steps to configure the boot loader to use ttyS0 as a console terminal for both input and output depend on the GRUB version. Run the following command on the operating system to determine the GRUB version:

```
grub install --version
```

If the version number returned is 2.x, use the steps for GRUB 2. For earlier versions, use the steps for GRUB.

To configure GRUB2

1. Run the following command to modify the GRUB configuration file:

   ```
   sudo vi /etc/default/grub
   ```

2. Confirm that the configuration file contains the following:

   ```
   GRUB_SERIAL_COMMAND="serial --unit=0 --speed=115200"
                                                    GRUB_TERMINAL="serial console"
   ```

3. Append the following to the end of the `GRUB_CMDLINE_LINUX` line:

   ```
   console=tty1 console=ttyS0,115200
   ```

   If `GRUB_CMDLINE_LINUX` does not exist, create this line, using `GRUB_CMDLINE_OUTPUT` as a template.

4. Regenerate the GRUB2 configuration using the following command:

   ```
   sudo grub2-mkconfig -o /boot/grub2/grub.cfg
   ```

   If you have a beta version of GRUB 2, use this command instead:

   ```
   sudo grub-mkconfig -o /boot/grub/grub.cfg
   ```

To configure GRUB

1. Run the following command to modify the GRUB configuration file:

   ```
   sudo vi /boot/grub/grub.conf
   ```

2. Add following after the line containing `timeout`:

   ```
   serial --unit=0 --speed=115200
   terminal --timeout=5 serial console
   ```

3. Append the following to each `kernel` line:

```
console=tty1 console=ttyS0,115200
```

CONFIGURING THE OPERATING SYSTEM

The operating system may already be configured to use ttyS0 as a console terminal for both input and output. To verify, run the following command:

```
sudo vi /etc/securetty
```

Check the file for `ttyS0`. If you don't see it, append `ttyS0` to the end of the file.

VALIDATING SERIAL CONSOLE ACCESS

After completing the steps to enable serial console access to the image, you should validate that serial console access is working by testing the image with serial console in your virtualization environment. Consult the documentation for your virtualization environment for steps to do this. Verify that the boot output displays in the serial console output and that there is interactive input after the image has booted.

TROUBLESHOOTING THE SERIAL CONSOLE

If no output is displayed on the serial console, verify in the configuration for your virtualization environment that the serial console device is attached to the first serial port.

If the serial console displays output, but there is no interactive input available, check that there is a terminal process listening on the ttyS0 port. To do this, run the following command:

```
ps aux | grep ttyS0
```

This command should output a terminal process that is listening on the ttyS0 port. For example, if your system is using getty, you will see the following output:

```
/sbin/getty ttyS0
```

If you don't see this output, it is likely that a login process is not configured for the serial console connection. To resolve this, enable the init settings, so that a terminal process is listening on the ttyS0 at startup.

For example, if your system is using getty, add the following command to the init settings to run on system startup:

```
getty -L 9600 ttyS0 vt102
```

The steps to do this will vary depending on the operating system, so consult the documentation for the image's operating system.

OS Kernel Updates

Note

This topic applies only to Linux instances that were launched before February 15, 2017. Linux instances launched on or after February 15, 2017 boot directly from the image and do not require further action for kernel updates.

Oracle Cloud Infrastructure boots each instance from a network drive. This configuration requires additional actions when you update the OS kernel.

Oracle Cloud Infrastructure uses Unified Extensible Firmware Interface (UEFI) firmware and a Preboot eXecution Environment (PXE) interface on the host server to load iPXE from a Trivial File Transfer Protocol (TFTP) server. The iPXE implementation runs a script to boot Oracle Linux. During the boot process, the system downloads the kernel, the `initrd` file, and the kernel boot parameters from the network. The instance does not use the host's GRUB boot loader.

Normally, the `yum update kernel-uek` command edits the GRUB configuration file, either `grub.cfg` or `grub.conf`, to configure the next boot. Since bare metal instances do not use the GRUB boot loader, changes to the GRUB configuration file are not implemented. When you update the kernel on your instance, you also must upload the update to the network to ensure a successful boot process. The following approaches address this need:

- Instances launched from an Oracle-provided image include an Oracle yum plug-in that seamlessly handles the upload when you run the `yum update kernel-uek` command.
- If you use a custom image based on an Oracle-provided image, the included yum plug-in will continue to work, barring extraordinary changes.
- If you install your own package manager, you must either write your own plug-in or upload the kernel, initrd, and kernel boot parameters manually.

Oracle Yum Plug-in

On instances launched with an Oracle-provided image, you can find the Oracle yum plug-in at:

```
/usr/share/yum-plugins/kernel-update-handler.py
```

The plug-in configuration is at:

```
/etc/yum/pluginconf.d
```

The plug-in looks for two variables in the `/etc/sysconfig/kernel` file, `UPDATEDEFAULT` and `DEFAULTKERNEL`. It picks up the updates only when the first variable is set to "yes" and the `DEFAULTKERNEL` value matches the kernel being updated. For example:

```
# UPDATEDEFAULT specifies if new-kernel-pkg should make
# new kernels the default
UPDATEDEFAULT=yes

# DEFAULTKERNEL specifies the default kernel package type
DEFAULTKERNEL=kernel-uek
```

Oracle-provided images incorporate the Unbreakable Enterprise Kernel (UEK). If you want to switch to a non-UEK kernel, you must update the `DEFAULTKERNEL` value to "kernel" before you run `yum update kernel`.

Manual Updates

Tip

Oracle recommends using the Oracle yum plug-in to update the kernel.

If you manually upload the updates, there are four relevant URLs:

`http://169.254.0.3/kernel`

`http://169.254.0.3/initrd`

`http://169.254.0.3/cmdline`

`http://169.254.0.3/activate`

The first three URLs are for uploading files (HTTP request type PUT). The fourth URL is for activating the uploaded files (HTTP request type POST). The system discards the uploaded files if they are not activated before the host restarts.

The kernel and initrd are simple file uploads. The cmdline upload must contain the kernel boot parameters found in the `grub.cfg` or `grub.conf` file, depending on the Linux version. The following example is an entry from the `/boot/efi/EFI/redhat/grub.cfg` file in Red Hat Linux 7. The highlighted text represents the parameters to upload.

```
kernel /boot/vmlinuz-4.1.12-37.5.1.el6uek.x86_64 ro root=UUID=8079e287-53d7-4b3d-b708-c519cf6829c8 rd_
NO_LUKS  KEYBOARDTYPE=pc KEYTABLE=us netroot=iscsi:@169.254.0.2::3260:iface1:eth0::iqn.2015-
02.oracle.boot:uefi rd_NO_MD SYSFONT=latarcyrheb-sun16 ifname=eth0:90:e2:ba:a2:e3:80 crashkernel=auto
iscsi_initiator=iqn.2015-02. rd_NO_LVM ip=eth0:dhcp rd_NO_DM LANG=en_US.UTF-8 console=tty0
console=ttyS0,9600 iommu=on
```

The following command returns what is being uploaded to the cmdline file.

```
cat /tmp/cmdline
```

A typical response resembles the following.

```
ro root=UUID=8079e287-53d7-4b3d-b708-c519cf6829c8 rd_NO_LUKS  KEYBOARDTYPE=pc KEYTABLE=us
netroot=iscsi:@169.254.0.2::3260:iface1:eth0::iqn.2015-02.oracle.boot:uefi rd_NO_MD SYSFONT=latarcyrheb-
```

```
sun16 ifname=eth0:90:e2:ba:a2:e3:80 crashkernel=auto iscsi_initiator=iqn.2015-02. rd_NO_LVM ip=eth0:dhcp
rd_NO_DM LANG=en_US.UTF-8 console=tty0 console=ttyS0,9600 iommu=on
```

The following commands update the `cmdline` and `initrd` files, and then activate the changes.

```
CKSUM=`md5sum /tmp/cmdline | cut -d ' ' -f 1`
```

```
sudo curl -X PUT --data-binary @/tmp/cmdline -H "Content-MD5: $CKSUM" http://169.254.0.3/cmdline
```

```
CKSUM=`md5sum /boot/initramfs-3.8.13-118.8.1.el7uek.x86_64.img | cut -d ' ' -f 1`
```

```
sudo curl -X PUT --data-binary @/boot/initramfs-3.8.13-118.8.1.el7uek.x86_64.img -H "Content-MD5:
$CKSUM" http://169.254.0.3/initrd
```

```
sudo curl -X POST http://169.254.0.3/activate
```

Managing Key Pairs on Linux Instances

Instances launched using Oracle Linux, CentOS, or Ubuntu images use an SSH key pair instead of a password to authenticate a remote user (see Security Credentials). A key pair consists of a private key and public key. You keep the private key on your computer and provide the public key every time you launch an instance.

When you connect to an instance using SSH, you provide the path to the key pair file in the SSH command. You can have as many key pairs as you want, or you can keep it simple and use one key pair for all or several of your instances.

To create key pairs, you can use a third-party tool such as OpenSSH on UNIX-style systems (including Linux, Solaris, BSD, and OS X) or PuTTY Key Generator on Windows.

Prerequisites

If you're using a UNIX-style system, you probably already have the `ssh-keygen` utility installed. To determine if it's installed, type `ssh-keygen` on the command line. If it's not installed, you can download OpenSSH for UNIX from http://www.openssh.com/portable.html and install it.

If you're using a Windows operating system you will need PuTTY and the PuTTY Key Generator. Download PuTTY and PuTTYgen from http://www.putty.org and install them.

Creating an SSH Key Pair on the Command Line

1. Open a shell or terminal for entering the commands.
2. At the prompt, enter `ssh-keygen` and provide a name and passphrase when prompted. The keys will be created with the default values: RSA keys of 2048 bits.

Alternatively, you can type a complete `ssh-keygen` command, for example:

```
ssh-keygen -t rsa -N "" -b 2048 -C "<key_name>" -f <path/root_name>
```

The command arguments are shown in the following table:

Argument	Description
`-t rsa`	Use the RSA algorithm.
`-N "<passphrase>"`	A passphrase to protect the use of the key (like a password). If you don't want to set a passphrase, don't enter anything between the quotes. A passphrase is not required. You can specify one as a security measure to protect the private key from unauthorized use.
`-b 2048`	Generate a 2048-bit key. You don't have to set this if 2048 is acceptable, as 2048 is the default. A minimum of 2048 bits is recommended for SSH-2 RSA.
`-C "<key_name>"`	A name to identify the key.
`-f <path/root_name>`	The location where the key pair will be saved and the root name for the files.

Creating an SSH Key Pair Using PuTTY Key Generator

1. Find `puttygen.exe` in the PuTTY folder on your computer, for example, `C:\Program Files (x86)\PuTTY`. Double-click `puttygen.exe` to open it.
2. Specify a key type of SSH-2 RSA and a key size of 2048 bits:
   - In the **Key** menu, confirm that the default value of **SSH-2 RSA key** is selected.
   - For the **Type of key to generate**, accept the default key type of **RSA**.
   - Set the **Number of bits in a generated key** to 2048 if it is not already set.
3. Click **Generate**.
4. Move your mouse around the blank area in the PuTTY window to generate random data in the key.
   When the key is generated, it appears under **Public key for pasting into OpenSSH authorized_keys file**.
5. A **Key comment** is generated for you, including the date and time stamp. You can keep the default comment or replace it with your own more descriptive comment.
6. Leave the **Key passphrase** field blank.
7. Click **Save private key**, and then click **Yes** in the prompt about saving the key without a passphrase.
   The key pair is saved in the PuTTY Private Key (PPK) format, which is a proprietary format that works only with the PuTTY tool set.
   You can name the key anything you want, but use the `ppk` file extension. For example, `mykey.ppk`.
8. Select *all* of the generated key that appears under **Public key for pasting into OpenSSH authorized_keys file**, copy it using **Ctrl + C**, paste it into a text file, and then save the file in the same location as the private key.
   (Do not use **Save public key** because it does not save the key in the OpenSSH format.)
   You can name the key anything you want, but for consistency, use the same name as the private key and a file extension of `pub`. For example, `mykey.pub`.

9. Write down the names and location of your public and private key files. You will need the public key when launching an instance. You will need the private key to access the instance via SSH.

Now that you have a key pair, you're ready to launch instances as described in Creating an Instance.

Creating an Instance

You can create an instance using the Console or API. When you create an instance, it is automatically attached to a virtual network interface card (VNIC) in the cloud network's subnet and given a private IP address from the subnet's CIDR. You can either let the address be automatically assigned, or specify a particular address of your choice. The private IP address lets instances within the cloud network communicate with each other. They can instead use fully qualified domain names (FQDNs) if you've set up the cloud network for DNS (see DNS in Your Virtual Cloud Network).

If the subnet is public, you can optionally assign the instance a public IP address. A public IP address is required to communicate with the instance over the Internet, and to establish a Secure Shell (SSH) or RDP connection to the instance from outside the cloud network. For more information, see Access to the Internet.

Tip

If this is your first time creating an instance, consider following the Getting Started Tutorial for a guided workflow through the steps required to create an instance.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK,

CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

Tip

When you create an instance, several other resources are involved, such as an image, a cloud network, and a subnet. Those other resources can be in the same compartment with the instance or in other compartments. You must have the required level of access to each of the compartments involved in order to launch the instance. This is also true when you attach a volume to an instance; they don't have to be in the same compartment, but if they're not, you need the required level of access to each of the compartments.

For administrators: The simplest policy to enable users to create instances is listed in Let users launch Compute instances. It gives the specified group general access to managing instances and images, along with the required level of access to attach existing block volumes to the instances. If the group needs to *create* block volumes, they'll need the ability to *manage* block volumes (see Let volume admins manage block volumes, backups, and volume groups).

Partner Image Catalog

If the group needs to create instances based on partner images, they'll need the *manage* permission for app-catalog-listing to create subscriptions to images from the Partner Image catalog. See Let users list and subscribe to images from the Partner Image catalog.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

To create a Linux or Windows instance, see the corresponding section that follows:

Creating a Linux Instance

Prerequisites

To create a Linux instance, you'll need:

- A cloud network to launch the instance into. For information about setting up cloud networks, see Overview of Networking.
- The public key, in OpenSSH format, from the key pair that you plan to use for connecting to the instance via SSH. The following sample public key is abbreviated for readability:

  ```
  ssh-rsa AAAAB3NzaC1yc2EAAAABJQAA....lo/gKMLVM2xzc1xJr/Hc26biw3TXWGEakrK1OQ== rsa-key-20160304
  ```

  For information about generating a key pair, see Managing Key Pairs on Linux Instances.

To create a Linux instance using the Console:

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. Choose a **Compartment** you have permission to work in, and then click **Create Instance**.
2. In the **Create Compute Instance** dialog box, you specify the resources to use for your instance. By default, your instance launches in the current compartment, and the resources you choose also come from the current compartment.
   In the **Create Compute Instance** dialog box, you can specify the following:
   - **Name your instance:** The name for the instance. You can add or change the name later. The name doesn't need to be unique; an Oracle Cloud Identifier (OCID) uniquely identifies the instance.

- **Select an availability domain for your instance:** The availability domain in which you want to run the instance.
- **Choose an operating system or image source:** The source of the image to use for booting the instance. When you click **Change Image Source**, the **Browse All Images** dialog box opens with the operating system or image source options. The following options are available:
  - **Platform Images:** Pre-built images for Oracle Cloud Infrastructure. See Oracle-Provided Images for a list of these images.
  - **Partner Images:** Trusted third-party images published by Oracle partners.
  - **Oracle Images:** Pre-built Oracle enterprise images and solutions enabled for Oracle Cloud Infrastructure.
  - **Custom Images:** Custom images created or imported into your Oracle Cloud Infrastructure environment. See Managing Custom Images for more information.
  - **Boot Volumes:** Boot volumes available for creating a new instance in your Oracle Cloud Infrastructure environment. See Boot Volumes for more information.
  - **Image OCID:** Create an instance using a specific version of an image by providing the image OCID. See Oracle-Provided Image Release Notes to determine the image OCID for Oracle-provided images.
- **Choose instance type:** Select **Virtual Machine** or **Bare Metal Machine**.
- **Choose instance shape:** A template that determines the number of CPUs, amount of memory, and other resources allocated to a newly created instance. When you click **Change Shape**, the **Browse All Shapes** dialog box opens with a list of the virtual machine (VM) or bare metal shapes that are available for the instance type that you selected. Incompatible shapes don't appear in the list. See Compute Shapes for more information about bare metal and VM shapes. Choose a shape and then click **Select Shape**.
- **Configure boot volume:** Size and encryption options for the instance's boot

volume.

To specify a custom size for the boot volume, select the **Custom boot volume size (in GB)** check box. Then, enter a custom size from 50 GB to 32 TB. The specified size must be larger than the default boot volume size for the selected image. See Custom Boot Volume Sizes for more information.

For VM instances, you can optionally select the **Use in-transit encryption** check box. See Block Volume Encryption for more information. If you are using your own Key Management encryption key for the boot volume, then this key is also used for in-transit encryption. Otherwise, the Oracle-provided encryption key is used.

Boot volumes are encrypted by default, but you can optionally encrypt the data in this volume using your own Key Management encryption key. To use Key Management for your encryption needs, select the **Encrypt using Key Management** check box. Then, select the **Vault Compartment** and **Vault** that contain the master encryption key you want to use. Also select the **Master Encryption Key Compartment** and **Master Encryption Key**. For more information about encryption, see Overview of Key Management. If you enable this option, this key is used for both data at rest encryption and in-transit encryption.

- **Add SSH key:** The public key portion of the key pair that you want to use for SSH access to the instance. You can drag and drop single key files into the box. To provide multiple keys, click **Choose files**, then press and hold down the Command key (on Mac) or the CTRL key (on Windows) while selecting files.
- **Configure networking:** The network details for the instance. In this section, you configure the following:
  - **Virtual Cloud Network Compartment:** The compartment containing the network in which to create the instance.
  - **Virtual Cloud Network:** The network in which to create the instance.
  - **Subnet Compartment:** The compartment containing a subnet within the cloud network to attach the instance to.

- **Subnet:** A subnet within the cloud network to attach the instance to. The subnets are either public or private. Private means the instances in that subnet can't have public IP addresses. For more information, see Access to the Internet. Subnets can also be either AD-specific or regional (regional ones have "*regional*" after the name). Oracle recommends using regional subnets. For more information, see About Regional Subnets.

- **Show Advanced Options:** Advanced networking and management options.

  On the **Management** tab, configure the following:

  - **Choose a compartment for your instance:** The compartment in which you want to launch the instance.
  - **Choose a fault domain:** The fault domain to use for the instance. If you do not specify the fault domain, the system selects one for you. After the instance has been created, if you want to change the fault domain you need to terminate the instance and launch a new instance in the preferred fault domain. For more information, see Fault Domains and Best Practices for Your Compute Instance.
  - **User Data:** Data to be used by cloud-init to run custom scripts or provide custom cloud-init configuration. Click **Browse** to select the script file, or paste the script into the text box. The file or script does not need to be base64-encoded, because the Console performs this encoding when the information is submitted. For information about how to take advantage of user data, see the cloud-init documentation.
  - **Enable monitoring**: Select this check box to collect metrics for this instance. When enabled, the OracleCloudAgent software on the instance emits metrics for this instance to the Monitoring service using the oci_computeagent metric namespace.

    This option is available for supported images only. Legacy versions of supported images may also require installation of the OracleCloudAgent software. For more information, see Enabling Monitoring for Compute Instances.

- **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.

On the **Networking** tab, configure the following:

- **Private IP Address:** Optional. An available private IP address of your choice from the subnet's CIDR. If you don't specify a value, the private IP address is automatically assigned.
- **Assign public IP address:** Whether to assign the instance a public IP address. Available only if the subnet is public. For more information, see Access to the Internet.
- **Hostname:** Optional. A hostname to be used for DNS within the cloud network. Available only if the VCN and subnet both have DNS labels. For more information, see DNS in Your Virtual Cloud Network.

On the **Image** tab, you can optionally change the image build. By default, the latest build of the image is used to create the instance. You can select an older build of the image that is compatible with the shape you selected. Only compatible image builds are displayed in the list. You need to select a shape before you can change the image build.

3. Click **Create**.

After the instance is provisioned, details about it appear in the instance list. To view additional details, including IP addresses, click the instance name.

When the instance is fully provisioned and running, you can connect to it using SSH as described in Connecting to an Instance.

You also can attach a volume to the instance, provided the volume is in the same availability domain. For background information about volumes, see Overview of Block Volume.

Creating a Windows Instance

Prerequisites

To create a Windows instance, you'll need:

- A cloud network to launch the instance into. For information about setting up cloud networks, see Overview of Networking.
- A security list that enables Remote Desktop Protocol (RDP) access so you can connect to your instance. Specifically, you need a stateful ingress rule for TCP traffic on destination port 3389 from source 0.0.0.0/0 and any source port. For more information, see Security Lists.

To enable RDP access

1. Open the navigation menu. Under **Core Infrastructure**, go to **Networking** and click **Virtual Cloud Networks**.
2. Click the cloud network you're interested in.
3. Under **Resources**, click **Security Lists**. Then click the security list you're interested in.
4. Click **Edit All Rules**.
5. Under **Allow Rules for Ingress**, click **+ Another Ingress Rule**.
6. Enter the following values for the rule:
    a. **Source Type:** CIDR
    b. **Source CIDR:** 0.0.0.0/0
    c. **IP Protocol:** RDP (TCP/3389)
    d. **Source Port Range:** All
    e. **Destination Port Range:** 3389
7. When done, click **Save Security List Rules**.

To create a Windows instance using the Console:

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. Choose a **Compartment** you have permission to work in, and then click **Create Instance**.
2. In the **Create Compute Instance** dialog box, you specify the resources to use for your instance. By default, your instance launches in the current compartment, and the resources you choose also come from the current compartment.
   In the **Create Compute Instance** dialog box, you can specify the following:
   - **Name your instance:** The name for the instance. You can add or change the name later. The name doesn't need to be unique; an Oracle Cloud Identifier (OCID) uniquely identifies the instance.
   - **Select an availability domain for your instance:** The availability domain in which you want to run the instance.
   - **Choose an operating system or image source:** The source of the image to use for booting the instance. When you click **Change Image Source**, the **Browse All Images** dialog box opens with the operating system or image source options. The following options are available:
     - **Platform Images:** Pre-built images for Oracle Cloud Infrastructure. See Oracle-Provided Images for a list of these images.
     - **Partner Images:** Trusted third-party images published by Oracle partners.
     - **Oracle Images:** Pre-built Oracle enterprise images and solutions enabled for Oracle Cloud Infrastructure.
     - **Custom Images:**Custom images created or imported into your Oracle Cloud Infrastructure environment. See Managing Custom Images for more information.
     - **Boot Volumes:** Boot volumes available for creating a new instance in your Oracle Cloud Infrastructure environment. See Boot Volumes for more information.
     - **Image OCID:** Create an instance using a specific version of an image by

providing the image OCID. See Oracle-Provided Image Release Notes to determine the image OCID for Oracle-provided images.

- **Choose instance type:** Select **Virtual Machine** or **Bare Metal Machine**.
- **Choose instance shape:** A template that determines the number of CPUs, amount of memory, and other resources allocated to a newly created instance.

  When you click **Change Shape**, the **Browse All Shapes** dialog box opens with a list of virtual machine (VM) or bare metal shapes that are available for the instance type that you selected. Incompatible shapes don't appear in the list. See Compute Shapes for more information about bare metal and VM shapes. Choose a shape and then click **Select Shape**.
- **Configure boot volume:** Size and encryption options for the instance's boot volume.

  To specify a custom size for the boot volume, select the **Custom boot volume size (in GB)** check box. Then, enter a custom size from 50 GB (256 GB for Oracle-provided Windows images) to 32 TB. The specified size must be larger than the selected image's default boot volume size. See Custom Boot Volume Sizes for more information.

  For VM instances, you can optionally select the **Use in-transit encryption** check box. See Block Volume Encryption for more information. If you are using your own Key Management encryption key for the boot volume, then this key is also used for in-transit encryption. Otherwise, the Oracle-provided encryption key is used.

  Boot volumes are encrypted by default, but you can optionally encrypt the data in this volume using your own Key Management encryption key. To use Key Management for your encryption needs, select the **Encrypt using Key Management** check box. Then, select the **Vault Compartment** and **Vault** that contain the master encryption key you want to use. Also select the **Master Encryption Key Compartment** and **Master Encryption Key**. For more information about encryption, see Overview of Key Management.
- **Add SSH key:** The public key portion of the key pair that you want to use for SSH access to the instance. You can drag and drop single key files into the box. To

provide multiple keys, click **Choose files**, then press and hold down the Command key (on Mac) or the CTRL key (on Windows) while selecting files.

- **Configure networking:** The network details for the instance. In this section, you configure the following:
  - **Virtual Cloud Network Compartment:** The compartment containing the network in which to create the instance.
  - **Virtual Cloud Network:** The network in which to create the instance.
  - **Subnet Compartment:** The compartment containing a subnet within the cloud network to attach the instance to.
  - **Subnet:** A subnet within the cloud network to attach the instance to. The subnets are either public or private. Private means the instances in that subnet can't have public IP addresses. For more information, see Access to the Internet. Subnets can also be either AD-specific or regional (regional ones have "*regional*" after the name). Oracle recommends using regional subnets. For more information, see About Regional Subnets.
- **Show Advanced Options:** Advanced networking and management options.
  On the **Management** tab, configure the following:
  - **Choose a compartment for your instance:** The compartment in which you want to launch the instance.
  - **Choose a fault domain:** The fault domain to use for the instance. If you do not specify the fault domain, the system selects one for you. After the instance has been created, if you want to change the fault domain you need to terminate the instance and launch a new instance in the preferred fault domain. For more information, see Fault Domains and Best Practices for Your Compute Instance.
  - **User Data:** Data to be used by cloudbase-init to run custom scripts or provide custom cloudbase-init configuration. Click **Browse** to select the script file, or paste the script into the text box. The file or script does not need to be base64-encoded, because the Console performs this encoding

when the information is submitted. For information about how to take advantage of user data, see the cloudbase-init documentation.

Warning

Do not include anything in the script that could trigger a reboot as this could impact the instance launch, causing it to fail. Any actions requiring a reboot should only be performed once the instance state is **RUNNING**.

- **Enable monitoring**: Select this check box to collect metrics for this instance. When enabled, the OracleCloudAgent software on the instance emits metrics for this instance to the Monitoring service using the oci_computeagent metric namespace.

  This option is available for supported images only. Legacy versions of supported images may also require installation of the OracleCloudAgent software. For more information, see Enabling Monitoring for Compute Instances.

- **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.

On the **Networking** tab, configure the following:

- **Private IP Address:** Optional. An available private IP address of your choice from the subnet's CIDR. If you don't specify a value, the private IP address is automatically assigned.

- **Assign public IP address:** Whether to assign the instance a public IP address. Available only if the subnet is public. For more information, see Access to the Internet.
- **Hostname:** Optional. A hostname to be used for DNS within the cloud network. Available only if the VCN and subnet both have DNS labels. For more information, see DNS in Your Virtual Cloud Network.

On the **Image** tab, you can optionally change the image build. By default, the latest build of the image is used to create the instance. You can select an older build of the image that is compatible with the shape you selected. Only compatible image builds are displayed in the list. You need to select a shape before you can change the image build.

3. Click **Create**.

After the instance is provisioned, details about it appear in the instance list. To view additional details, including IP addresses and the initial Windows password, click the instance name.

When the instance is fully provisioned and running, you can connect to it using Remote Desktop as described in Connecting to an Instance.

You also can attach a volume to the instance, provided the volume is in the same availability domain. For background information about volumes, see Overview of Block Volume.

Managing Tags for an Instance

You can apply tags to your resources, such as instances, to help you organize them according to your business needs. You can apply tags when you create an instance, or you can update the instance later with the tags that you want.

To manage tags for an instance

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.

2. Click the instance that you're interested in.
3. Click the **Tags** tab to view or edit the existing tags. Or click **Apply tag(s)** to add new ones.

For more information, see Resource Tags.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage instances:

- ListInstances
- LaunchInstance
- GetInstance
- UpdateInstance
- TerminateInstance
- GetWindowsInstanceInitialCredentials

Oracle Cloud Infrastructure enables you to launch instances from images published by Oracle partners from the Partner Image catalog. Use these APIs to work with the Partner Image catalog listings:

- AppCatalogListing
- AppCatalogListingResourceVersion
- AppCatalogListingResourceVersionAgreements
- AppCatalogListingResourceVersionSummary
- AppCatalogListingSummary
- AppCatalogSubscription
- AppCatalogSubscription

Managing Compute Instances

You can simplify the management of your Compute instances using resources such as instance configurations and instance pools.

An instance configuration is a template that defines the settings to use when creating Compute instances.

An instance pool is a group of instances within the same region that are created based off of an instance configuration.

Instance Configurations

An instance configuration defines the settings to use when creating Compute instances as part of an instance pool, including details such as the base image, shape, and metadata. You can also specify the associated resources for the instance, such as block volume attachments and network configuration.

You create an instance configuration from an existing Compute instance. For steps, see Creating an Instance Configuration.

To modify an existing instance configuration, create a new instance configuration with the desired settings.

For steps to delete an instance configuration, see Deleting an Instance Configuration.

Use these API operations to work with instance configurations:

- CreateInstanceConfiguration
- DeleteInstanceConfiguration
- GetInstanceConfiguration
- UpdateInstanceConfiguration
- ListInstanceConfigurations

Instance Pools

Instance pools give you the ability to provision and create multiple Compute instances based off of the same instance configuration, within the same region. They also enable integration with other services, such as the Load Balancing service and IAM service, making it easier to manage groups of instances.

You create an instance pool using an existing instance configuration. For steps, see Creating an Instance Pool.

You can automatically adjust the number of instances in an instance pool based on performance metrics such as CPU utilization. To do this, you enable autoscaling for the instance pool. For background information and steps, see Autoscaling.

After you have created an instance pool, you can update the size and attach or detach load balancers from the Console. To update additional settings, you need to use the CLI, API, or SDKs.

If you need to update the instance configuration, create a new instance configuration and then update the instance pool to use the new instance configuration. For more information, see Updating an Instance Pool.

For steps to delete an instance pool, see Deleting an Instance Pool.

Warning

When you delete an instance pool all of its resources will be permanently deleted, including associated instances, attached boot volumes, and block volumes.

Instance Pool Lifecycle States

The following list describes the different lifecycle states for instance pools.

- **Provisioning:** When you create an instance pool, this is the first state the instance pool is in. Instances for the instance pool are being configured based on the specified instance configuration.
- **Starting:** The instances are being launched. At this point, the only action you can take is to terminate the instance pool.
- **Running:** The instances are created and running.
- **Stopping:** The instances are in the process of being shut down.
- **Stopped:** The instances are shut down.
- **Scaling:** Once an instance pool has been created, if you update the instance pool size, it will go into this state while creating (for increases in size) or terminating (for decreases in size) instances. At this point, the only action you can take is to terminate the instance pool.
- **Terminating:** The instances and associated resources are being terminated.
- **Terminated:** The instance pool, all its instances and associated resources are terminated.

When working with instance configurations and instance pools, keep the following in mind:

- You can't delete an instance configuration if it is associated with at least one instance pool.
- You can use the same instance configuration for multiple instance pools. However, an instance pool can only have one instance configuration associated with it.
- Instance configurations must be in the same compartment where you want to create the associated instance pool.
- If the instance pool has been in the scaling or provisioning state for an extended period of time, it may be because the number of instances requested has exceeded your tenancy's service limits for that shape and availability domain. Check your tenancy's service limits for Compute. If you want to request a limit increase, you need to contact support. For more information, see Service Limits. If this occurs, you need to terminate the instance pool and re-create it.
- If you modify the instance configuration for an instance pool, existing instances that are

part of that pool will not change. Any new instances created after the instance configuration change will use the new instance configuration. New instances will not be created unless you have increased the size of the instance pool or terminate existing instances.

- If you decrease the size of an instance pool, the oldest instances will be terminated first.

Use these API operations to manage instance pools:

- CreateInstancePool
- GetInstancePool
- ResetInstancePool
- SoftresetInstancePool
- StartInstancePool
- StopInstancePool
- TerminateInstancePool
- UpdateInstancePool
- ListInstancePools
- ListInstancePoolInstances
- AttachLoadBalancer
- DetachLoadBalancer

Creating an Instance Configuration

Instance configurations allow you to define the configuration to use when creating Compute instances as part of an instance pool, see Managing Compute Instances for more information.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK,

CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: For a typical policy that gives access to instance pools and instance configurations, see Let users manage Compute instance configurations and instance pools.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. In the list of instances, find the instance you want to use to create the instance configuration.
3. Click the highlighted name of the instance to display the instance details.
4. Click **Create Instance Configuration**.
5. Select the compartment you want to create the instance configuration in.
6. Specify a name for the instance configuration. It doesn't have to be unique, and it cannot be changed later in the Console (but you can change it with the API). Avoid entering confidential information.
7. Click **Create Instance Configuration**.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the CreateInstanceConfiguration operation to create an instance configuration.

Creating an Instance Pool

Instance pools give you the ability to provision and create multiple Compute instances based off of the same configuration, within the same region. See Managing Compute Instances for more information.

Optionally, you can associate a load balancer with an instance pool. If you do this, when you add an instance to the instance pool, the instance is automatically added to the load balancer's backend set . After the instance reaches a healthy state (the instance is listening on the configured port number), incoming traffic is automatically routed to the new instance. For background information about the Load Balancing service, see Overview of Load Balancing.

Note

There are some values for instance configuration settings that are incompatible with instance pools. If you try to create an instance pool with one or more of these settings, an error will occur. See Error occurs when creating an instance pool with a valid instance configuration for more information.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: For a typical policy that gives access to instance pools and instance configurations, see Let users manage Compute instance configurations and instance pools.

Prerequisites

Before you can create an instance pool, you need:

- An instance configuration. The instance configuration must be in the same compartment where you want to create the instance pool. For more information, see Creating an Instance Configuration.

- If you want to associate the instance pool with a load balancer, you need a load balancer and backend set. For steps to create a load balancer, see Managing a Load Balancer.

Using the Console

You can create an instance pool from the **Instance Configuration Details** page or from the **Instance Pools** page.

To create an instance pool from the Instance Configuration Details page

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instance Configurations**.
2. Click the instance configuration that you want to use to create the instance pool.
3. Click **Create Instance Pool**.
4. In the **Create in Compartment** list, select the compartment that you want to create the instance configuration in. This must be the same compartment as the instance configuration you're using.
5. Specify a name for the instance pool. It doesn't have to be unique, and it cannot be changed later in the Console (but you can change it with the API).
6. Specify the targeted number of instances for the instance pool.

7. If you want to associate a load balancer with the instance pool, select **Attach a Load Balancer**. Then, enter the following:
   - **Load Balancer Compartment:** The compartment that the load balancer is in.
   - **Load Balancer:** The load balancer to associate with the instance pool.
   - **Backend Set:** The name of the backend set on the load balancer to add instances to.
   - **Port:** The server port on the instances to which the load balancer must direct traffic. This value applies to all instances that use this load balancer attachment.
   - **VNIC:** The VNIC to use when adding the instance to the backend set. Instances that belong to a backend set are also called backend servers. The private IP address is used. This value applies to all instances that use this load balancer attachment.

   For background information about load balancers, see Overview of Load Balancing.
8. In the **Availability Domain** section, enter the following:
   - **Availability Domain:** The availability domain to launch the instances in.
   - **Virtual Cloud Network Compartment:** The compartment that the virtual cloud network (VCN) is in.
   - **Primary VNIC:** The primary **Virtual Cloud Network** and **Subnet** for the instance pool.
   - **Secondary VNIC:** This option appears only if secondary VNICs are defined by the instance configuration. Select the secondary **Virtual Cloud Network** and **Subnet** for the instance pool.

   If you want to configure the instance pool to create instances in more than one availability domain, click **+ Additional Selection** and select a different availability domain for the instance pool. Then, specify the VCN details for the second availability domain.
9. Click **Create Instance Pool**.

To create an instance pool from the Instance Pools page

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instance Pools**.
2. Click **Create Instance Pool**.
3. In the **Create in Compartment** list, select the compartment that you want to create the instance pool in. This must be the same compartment as the instance configuration you're using.
4. Specify a name for the instance pool. It doesn't have to be unique, and it cannot be changed later in the Console (but you can change it with the API).
5. Specify the targeted **Number of Instances** for the instance pool.
6. In the **Instance Configuration Compartment** list, select the compartment that contains the instance configuration that you want to use for creating the instance pool.
7. Select the **Instance Configuration** to use when creating the instance pool's instances.
8. If you want to associate a load balancer with the instance pool, select **Attach a Load Balancer**. Then, enter the following:
   - **Load Balancer Compartment:** The compartment that the load balancer is in.
   - **Load Balancer:** The load balancer to associate with the instance pool.
   - **Backend Set:** The name of the backend set on the load balancer to add instances to.
   - **Port:** The server port on the instances to which the load balancer must direct traffic. This value applies to all instances that use this load balancer attachment.
   - **VNIC:** The VNIC to use when adding the instance to the backend set. Instances that belong to a backend set are also called backend servers. The private IP address is used. This value applies to all instances that use this load balancer attachment.

   For background information about load balancers, see Overview of Load Balancing.

9. In the **Availability Domain** section, enter the following:
    - **Availability Domain:** The availability domain to launch the instances in.
    - **Virtual Cloud Network Compartment:** The compartment that the virtual cloud network (VCN) is in.
    - **Primary VNIC:** The primary **Virtual Cloud Network** and **Subnet** for the instance pool.
    - **Secondary VNIC:** This option appears only if secondary VNICs are defined by the instance configuration. Select the secondary **Virtual Cloud Network** and **Subnet** for the instance pool.

    If you want to configure the instance pool to create instances in more than one availability domain, click **+ Additional Selection** and select a different availability domain for the instance pool. Then, specify the VCN details for the second availability domain.
10. Click **Create Instance Pool**.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to create and manage instance pools:

- CreateInstancePool
- AttachLoadBalancer
- DetachLoadBalancer

Updating an Instance Pool

You can update the number of instances for an instance pool using the Console.

Optionally, you can associate a load balancer with an instance pool. If you do this, when you add an instance to the instance pool, the instance is automatically added to the load balancer's

backend set. After the instance reaches a healthy state (the instance is listening on the configured port number), incoming traffic is automatically routed to the new instance. For background information about the Load Balancing service, see Overview of Load Balancing.

To update other settings for an instance pool, use the command line interface (CLI), SDKs, or REST APIs.

You can automatically adjust the number of instances in an instance pool based on performance metrics such as CPU utilization. To do this, you enable autoscaling for the instance pool. For background information and steps, see Autoscaling.

See Managing Compute Instances for more information about instance pools and instance configurations.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: For a typical policy that gives access to instance pools and instance configurations, see Let users manage Compute instance configurations and instance pools.

Using the Console

To update the instance pool size

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instance Pools**.
2. Click the name of the instance pool that you're interested in.
3. Click **Edit**.
4. Specify the updated number of instances for the instance pool, and then click **Save**

Changes.

When you update the instance pool size, it triggers a scaling event. Keep the following in mind:

- If the instance pool lifecycle state is **RUNNING**, the instance pool will create new instances or terminate existing instances at that time, to match the new size of the instance pool. Instances are terminated in the order that they were created, first-in, first-out.
- If the instance pool lifecycle state is **STOPPED**, for an increase in size, new instances will be configured for the instance pool, but won't be launched. For a decrease in size, the instances will be terminated.

Important

If the instance pool has been in the scaling or provisioning state for an extended period of time, it may be because the number of instances requested has exceeded your tenancy's service limits for that shape and availability domain. Check your tenancy's service limits for Compute.

To attach a load balancer to an instance pool

You must have a load balancer and backend set to associate with the instance pool. For steps to create a load balancer, see Managing a Load Balancer.

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instance Pools**.
2. Click the name of the instance pool that you're interested in.
3. In the **Resources** section, click **Load Balancers**.

4. Click **Attach a Load Balancer**.
5. Enter the following:
    - **Load Balancer Compartment:** The compartment that the load balancer is in.
    - **Load Balancer:** The load balancer to associate with the instance pool.
    - **Backend Set:** The name of the backend set on the load balancer to add instances to.
    - **Port:** The server port on the instances to which the load balancer must direct traffic. This value applies to all instances that use this load balancer attachment.
    - **VNIC:** The VNIC to use when adding the instance to the backend set. Instances that belong to a backend set are also called backend servers. The private IP address is used. This value applies to all instances that use this load balancer attachment.
6. Click **Attach**.

To detach a load balancer from an instance pool

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instance Pools**.
2. Click the name of the instance pool that you're interested in.
3. In the **Resources** section, click **Load Balancers**.
4. Click the Actions icon (three dots) for the load balancer.
5. Click **Detach**, and then click **Detach** to confirm.

Using the API

To update other instance pool configuration settings, use the CLI, SDKs, or REST APIs. For information about using the CLI, see Command Line Interface (CLI). For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Note

There are some values for instance configuration settings that are incompatible with instance pools. If you try to update an instance pool with one or more of these settings, an error will occur. See Error occurs when creating or updating an instance pool with a valid instance configuration for more information.

For instance pool configuration settings, such as the instance configuration, display name, tags, or availability domain selections, use the UpdateInstancePool operation.

To manage the load balancers that are associated with an instance pool, use the AttachLoadBalancer and DetachLoadBalancer operations.

To update the configuration used by the instance pool when creating instances you can either:

- Create a new instance configuration with the desired settings. You can do this using the Console. For steps, see Creating an Instance Configuration. To do this using the API, use the CreateInstanceConfiguration operation.
- Update the existing instance configuration for the instance pool. You can only update the display name and tags of existing instance configurations. For any other updates, create a new instance configuration with the settings you want to use. To update the display name or tags, use the UpdateInstanceConfiguration operation. You cannot use the Console to update instance configuration settings.

Deleting an Instance Configuration

You can permanently delete instance configurations that you no longer need.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK,

CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: For a typical policy that gives access to instance pools and instance configurations, see Let users manage Compute instance configurations and instance pools.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instance Configurations**.
2. In the list of instance configurations, find the instance configuration you want to delete.
3. Click the highlighted name of the instance configuration to display the instance configuration details.
4. Click **Delete**, and then click **Delete Instance Configuration**.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the DeleteInstanceConfiguration operation to delete an instance configuration.

Deleting an Instance Pool

You can permanently delete instance pools that you no longer need.

Warning

When you delete an instance pool all of its resources will be permanently deleted, including associated instances, attached boot volumes, and block volumes.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: For a typical policy that gives access to instance pools and instance configurations, see Let users manage Compute instance configurations and instance pools.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instance Pools**.
2. Click the instance pool that you want to delete.
3. Click **Actions**, and then click **Terminate**.
4. Enter the name of the instance pool and click **Terminate**.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the DeleteInstanceConfiguration operation to delete an instance configuration.

Autoscaling

Autoscaling enables you to automatically adjust the number of Compute instances in an instance pool based on performance metrics such as CPU utilization. This helps you provide consistent performance for your end users during periods of high demand, and helps you reduce your costs during periods of low demand.

You select a performance metric to monitor, and set thresholds that the performance metric must reach to trigger an autoscaling event. When system usage meets a threshold,

autoscaling dynamically allocates resources in near-real time. As load increases, instances are automatically provisioned: the instance pool *scales out*. As load decreases, instances are automatically removed: the instance pool *scales in*.

Autoscaling relies on performance metrics that are collected by the Monitoring service. These performance metrics are aggregated into one-minute time periods and then averaged across the instance pool. When three consecutive values (that is, the average metrics for three consecutive minutes) meet the threshold, an autoscaling event is triggered.

A cooldown period between autoscaling events lets the system stabilize at the updated level. The cooldown period starts when the instance pool reaches a steady state. Autoscaling continues to evaluate performance metrics during the cooldown period. When the cooldown period ends, autoscaling adjusts the instance pool's size again if needed.

For background information about the Monitoring service, see Monitoring Overview. For information about the metrics emitted by Compute instances, see Compute Metrics.

Warning

Avoid entering confidential information when assigning descriptions, tags, or friendly names to your cloud resources through the Oracle Cloud Infrastructure Console, API, or CLI.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: For a typical policy that gives access to autoscaling configurations, see Let users manage Compute autoscaling configurations.

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Prerequisites

- You have an instance pool. Optionally, you can attach a load balancer to the instance pool. For steps to create an instance pool and attach a load balancer, see Creating an Instance Pool.
- Monitoring is enabled on the instances in the instance pool. For steps to enable monitoring, see Enabling Monitoring for Compute Instances.
- The instance pool supports the maximum number of instances that you want to scale to. This limit is determined by your tenancy's service limits. For more information, see Service Limits.

Using the Console

To create an autoscaling configuration

Each instance pool can have one autoscaling configuration.

You can create an autoscaling configuration from the **Instance Pools** page or the **Autoscaling Configurations** page.

To create an autoscaling configuration from the Instance Pools page

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instance Pools**.
2. Click the instance pool that you want to apply an autoscaling configuration to.

3. Click **Actions**, and then click **Create Autoscaling Configuration**.
4. Select the **Compartment** that you want to create the autoscaling configuration in. This must be the same compartment as the instance pool you're scaling.
5. Enter a name for the autoscaling configuration.
6. Select the **Instance Pool** to apply the autoscaling configuration to. The current instance pool is selected by default.
7. In the **Cooldown in Seconds** box, enter the minimum amount of time to wait between scaling events. The cooldown period gives the system time to stabilize before rescaling. The minimum value is 300 seconds.
8. In the **Autoscaling Policy** area, define the criteria that trigger autoscaling actions and the actions to take:
    a. Enter a name for the autoscaling policy.
    b. Select the **Performance Metric** that triggers an increase or decrease in the number of instances in the instance pool. For example, CPU utilization or memory utilization.
    c. In the **Scaling Limits** area, specify the number of instances in the instance pool:
        - **Minimum Number of Instances:** The minimum number of instances that the instance pool is allowed to decrease to.
        - **Maximum Number of Instances:** The maximum number of instances that the instance pool is allowed to increase to. The maximum number of instances depends on the limits for your tenancy. For more information, see Service Limits.
        - **Initial Number of Instances:** The number of instances to launch in the instance pool immediately after autoscaling is enabled. After autoscaling retrieves performance metrics, the number of instances is automatically adjusted from this initial number to a number that is based on the limits that you set.

d. In the **Scaling Rule** area, specify the thresholds that the performance metric must reach to trigger a scaling event:
   - Select a **Scale-Out Operator** and **Threshold Percentage** at which to increase the number of instances. Then enter the **Number of Instances to Add**. For example, when CPU utilization is greater than 90%, add 10 instances to the instance pool.
   - Select a **Scale-In Operator** and **Threshold Percentage** at which to decrease the number of instances. Then enter the **Number of Instances to Remove**. For example, when CPU utilization is less than 50%, remove 5 instances from the instance pool.

9. **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
10. Click **Create**.
    Autoscaling runs. The cooldown period starts when the instance pool's status changes from **SCALING** to **RUNNING**.

To create an autoscaling configuration from the Autoscaling Configuration page

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Autoscaling Configurations**.
2. Click **Create Autoscaling Configuration**.
3. Select the **Compartment** that you want to create the autoscaling configuration in. This must be the same compartment as the instance pool you're scaling.
4. Enter a name for the autoscaling configuration.
5. Select the **Instance Pool** to apply the autoscaling configuration to.

6. In the **Cooldown in Seconds** box, enter the minimum amount of time to wait between scaling events. The cooldown period gives the system time to stabilize before rescaling. The minimum value is 300 seconds.
7. In the **Autoscaling Policy** area, define the criteria that trigger autoscaling actions and the actions to take:
    a. Enter a name for the autoscaling policy.
    b. Select the **Performance Metric** that triggers an increase or decrease in the number of instances in the instance pool. For example, CPU utilization or memory utilization.
    c. In the **Scaling Limits** area, specify the number of instances in the instance pool:
        - **Minimum Number of Instances:** The minimum number of instances that the instance pool is allowed to decrease to.
        - **Maximum Number of Instances:** The maximum number of instances that the instance pool is allowed to increase to. The maximum number of instances depends on the limits for your tenancy. For more information, see Service Limits.
        - **Initial Number of Instances:** The number of instances to launch in the instance pool immediately after autoscaling is enabled. After autoscaling retrieves performance metrics, the number of instances is automatically adjusted from this initial number to a number that is based on the limits that you set.

d. In the **Scaling Rule** area, specify the thresholds that the performance metric must reach to trigger a scaling event:
   - Select a **Scale-Out Operator** and **Threshold Percentage** at which to increase the number of instances. Then enter the **Number of Instances to Add**. For example, when CPU utilization is greater than 90%, add 10 instances to the instance pool.
   - Select a **Scale-In Operator** and **Threshold Percentage** at which to decrease the number of instances. Then enter the **Number of Instances to Remove**. For example, when CPU utilization is less than 50%, remove 5 instances from the instance pool.

8. In the **Autoscaling Policy** area, define the criteria that trigger autoscaling actions and the actions to take:
   a. Enter a name for the autoscaling policy.
   b. Select the **Performance Metric** that triggers an increase or decrease in the number of instances in the instance pool. For example, CPU utilization or memory utilization.
   c. In the **Scaling Limits** area, specify the number of instances in the instance pool:
      - **Minimum Number of Instances:** The minimum number of instances that the instance pool is allowed to decrease to.
      - **Maximum Number of Instances:** The maximum number of instances that the instance pool is allowed to increase to. The maximum number of instances depends on the limits for your tenancy. For more information, see Service Limits.
      - **Initial Number of Instances:** The number of instances to launch in the instance pool immediately after autoscaling is enabled. After autoscaling retrieves performance metrics, the number of instances is automatically adjusted from this initial number to a number that is based on the limits that you set.

d. In the **Scaling Rule** area, specify the thresholds that the performance metric must reach to trigger a scaling event:
   - Select a **Scale-Out Operator** and **Threshold Percentage** at which to increase the number of instances. Then enter the **Number of Instances to Add**. For example, when CPU utilization is greater than 90%, add 10 instances to the instance pool.
   - Select a **Scale-In Operator** and **Threshold Percentage** at which to decrease the number of instances. Then enter the **Number of Instances to Remove**. For example, when CPU utilization is less than 50%, remove 5 instances from the instance pool.

9. **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
10. Click **Create**.
    Autoscaling runs. The cooldown period starts when the instance pool's status changes from **SCALING** to **RUNNING**.

To edit an autoscaling configuration

You can change these characteristics of an autoscaling configuration:

- Name
- Cooldown period between autoscaling actions

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Autoscaling Configurations**.
2. Click the autoscaling configuration that you're interested in.

3. Click **Edit**.
4. Update the **Name** or **Cooldown in Seconds**, and then click **Save Changes**.

To edit an autoscaling policy

You can change these characteristics of an autoscaling policy:

- Name
- Which performance metric triggers an autoscaling action
- Scale-out and scale-in operators and thresholds
- The number of instances to add or remove

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Autoscaling Configurations**.
2. Click the autoscaling configuration that you're interested in.
3. In the **Autoscaling Policies** area, click **Edit**.
4. Make your changes, and then click **Save**.

To disable an autoscaling configuration

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Autoscaling Configurations**.
2. Click the autoscaling configuration that you're interested in.
3. Click **Disable**, and then confirm when prompted.

To delete an autoscaling configuration

When you delete an autoscaling configuration, the instance pool remains in its most recent state.

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Autoscaling Configurations**.
2. Click the autoscaling configuration that you're interested in.
3. Click **Delete**, and then confirm when prompted.

To manage tags for an autoscaling configuration

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Autoscaling Configurations**.
2. Click the autoscaling configuration that you're interested in.
3. Click the **Tags** tab to view or edit the existing tags. Or click **Apply tag(s)** to add new ones.

For more information, see Resource Tags.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the Autoscaling API to manage autoscaling configurations and policies.

Connecting to an Instance

You can connect to a running instance by using a Secure Shell (SSH) or Remote Desktop connection. Most UNIX-style systems include an SSH client by default. To connect to a Linux instance from a Windows system, you can download a free SSH client called PuTTY from http://www.putty.org.

Required IAM Policy

To connect to a running instance with SSH, you don't need an IAM policy to grant you access. However, to SSH you need the public IP address of the instance (see Prerequisites below). If there's a policy that lets you launch an instance, that policy probably also lets you get the instance's IP address. The simplest policy that does both is listed in Let users launch Compute instances.

For administrators: Here's a more restrictive policy that lets the specified group get the IP address of existing instances and use power actions on the instances (e.g., stop, start, etc.), but not launch or terminate instances. The policy assumes the instances and the cloud network are together in a single compartment (XYZ):

```
Allow group InstanceUsers to read virtual-network-family in compartment XYZ

Allow group InstanceUsers to use instance-family in compartment XYZ
```

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Prerequisites

You'll need the following information to connect to the instance:

- For Linux Instances: The full path to the key pair that you used when you launched the instance. For information about generating key pairs, see Managing Key Pairs on Linux Instances.
- The default user name for the instance. If you used an Oracle-provided Linux, CentOS or Windows image to launch the instance, the user name is `opc`. If you used the Ubuntu image to launch the instance, the user name is `ubuntu`.
- The public IP address of the instance. You can get the address from the list of instances in the Console. Click **Compute**, choose your **Compartment**, and then find your instance in the list. Alternatively, you can use the Core Services API `ListVnicAttachments` and `GetVnic` operations.

Connecting to a Linux Instance

Log in to your instance using SSH.

Connecting to Your Linux Instance from a Unix-style System

1. Use the following command to set the file permissions so that only you can read the file:

   ```
   $ chmod 400 <private_key>
   ```

   <private_key> is the full path and name of the file that contains the private key associated with the instance you want to access.

2. Use the following SSH command to access the instance.

   ```
   $ ssh -i <private_key> <username>@<public-ip-address>
   ```

   <private_key> is the full path and name of the file that contains the private key associated with the instance you want to access.
   <username> is the default name for the instance. For Oracle Linux and CentOS images, the default user name is `opc`. For the Ubuntu image, the default name is `ubuntu`.
   <public-ip-address> is your instance IP address that you retrieved from the Console.

Connecting to Your Linux Instance from a Windows System

1. Open `putty.exe`.
2. In the **Category** pane, select **Window**, and then select **Translation**.
3. In the **Remote character set** drop-down list, select **UTF-8**. The default locale setting on Linux-based instances is UTF-8, and this configures PuTTY to use the same locale.
4. In the **Category** pane, select **Session** and enter the following:
   - **Host Name (or IP address)**:
     <username>@*<public-ip-address>*

<username> is the default name for the instance. For Oracle Linux and CentOS images, the default user name is `opc`. For the Ubuntu image, the default name is `ubuntu`.
<public-ip-address> is your instance public IP address that you retrieved from the Console

- **Port:** 22
- **Connection type:** SSH

5. In the **Category** pane, expand **Connection**, expand **SSH**, and then click **Auth**.
6. Click **Browse**, and then select your private key.
7. Click **Open** to start the session.
   If this is your first time connecting to the instance, you might see a message that the server's host key is not cached in the registry. Click **Yes** to continue the connection.

Connecting to a Windows Instance

You can connect to a Windows instance by using a Remote Desktop connection. Most Windows systems include a Remote Desktop client by default.

To enable Remote Desktop Protocol (RDP) access to the Windows instance, you need to add a stateful ingress rule for TCP traffic on destination port 3389 from source 0.0.0.0/0 and any source port.

To enable RDP access

1. Open the navigation menu. Under **Core Infrastructure**, go to **Networking** and click **Virtual Cloud Networks**.
2. Click the cloud network you're interested in.
3. Under **Resources**, click **Security Lists**. Then click the security list you're interested in.

4. Click **Edit All Rules**.
5. Under **Allow Rules for Ingress**, click **+ Another Ingress Rule**.
6. Enter the following values for the rule:
    a. **Source Type:** CIDR
    b. **Source CIDR:** 0.0.0.0/0
    c. **IP Protocol:** RDP (TCP/3389)
    d. **Source Port Range:** All
    e. **Destination Port Range:** 3389
7. When done, click **Save Security List Rules**.

Connecting to Your Windows Instance from a Remote Desktop Client

1. Open the Remote Desktop client.
2. In the **Computer** field, enter the public IP address of the instance you want to connect to. Your public IP is the instance address you get from the Console.
3. The **User name** is **opc**. Depending on the Remote Desktop client you are using, you might have to connect to the instance before you can enter this credential.
4. Click **Connect** to start the session.
5. Accept the certificate if you are prompted to do so.
6. If you are connecting to the instance for the first time, enter the initial password that was provided to you by Oracle Cloud Infrastructurewhen you launched the instance. You will be prompted to change the password as soon as you log in. Your new password must be at least 12 characters long and must comply with Microsoft's password policy. Otherwise, enter the password you created. If you are using a custom image, you may need to know the password for the instance the image was created from. For details about Windows custom images, see Creating Windows Custom Images.
7. Press **Enter**.

Instance Console Connections

The Oracle Cloud Infrastructure Compute service provides console connections that enable you to remotely troubleshoot malfunctioning instances, such as:

- An imported or customized image that does not complete a successful boot.
- A previously working instance that stops responding.

There are two types of instance console connections:

- Serial console connections
- VNC console connections

Creating the Instance Console Connection

Before you can connect to the serial console or VNC console, you need to create the instance console connection.

To create the console connection for an instance

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. In the list of instances, find the instance you want to access the serial console for, and then click the instance name.
3. In the **Resources** section on the **Instance Details** page, click **Console Connections**, and then click **Create Console Connection**.
4. Specify the public key portion for the SSH key, either by browsing and selecting a public key file, for example id_rsa.pub, or by pasting your public key into the text box, and then click **Create Console Connection**.

Once the console connection has been created and is available, the status changes to **ACTIVE**.

Connecting to the Serial Console

Once you have created the console connection for the instance, you can then connect to the serial console by using a Secure Shell (SSH) connection. Once you are finished with the serial console and have terminated the SSH connection, you should delete the serial console connection. If you do not disconnect from the session, Oracle Cloud Infrastructure will terminate the serial console session after 24 hours and you will need to re-authenticate to connect again.

Note

Serial console connections for VM instances launched prior to September 2017

Serial console connections only work for VM instances launched in September 2017 or later.

Note

Serial console connections for bare metal instances launched prior to November 2017

Serial console connections only work for Bare Metal instances launched in November 2017 or later.

Connecting from Mac OS X and Linux Operating Systems

You connect to the serial console by using an SSH client. Mac OS X and most Linux distributions by default include the SSH client OpenSSH.

To connect to the serial console for an instance using OpenSSH on Mac OS X or Linux

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. Click the instance you want to connect to.
2. On the **Instances Details** page, in the **Resources** section, click **Console Connections**.
3. Click the Actions icon (three dots), and then click **Connect with SSH**.
4. Select **LINUX/MAC OS** for **PLATFORM**.
5. Click **Copy** to copy the string to the clipboard.
6. Paste the connection string copied from the previous step to a terminal window on a Mac OS X or Linux system, and hit enter to connect to the console.

   If you are not using the default SSH key or ssh-agent, you can modify the serial console connection string to include the identity file flag, `-i` to specify the SSH key to use. You need to specify this for both the SSH connection and the SSH ProxyCommand, as shown in the following line:

   ```
   ssh -i /<path>/<ssh_key> -o ProxyCommand='ssh -i /<path>/<ssh_key> -W %h:%p -p 443...
   ```

7. Hit enter again to activate the console.

Connecting from Windows Operating Systems

Windows does not include an SSH client by default, so you need to install one. You can use PuTTY, or there are options that include a version of OpenSSH such as:

- git tools for Windows
- Windows Subsystem for Linux

Note that the steps to connect to the serial console from the PuTTY client will be different than the steps for OpenSSH.

To connect to the serial console for an instance on Microsoft Windows

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. Click the instance you want to connect to.
2. On the **Instances Details** page, in the **Resources** section, click **Console Connections**.
3. Click the Actions icon (three dots), and then click **Connect with SSH**.
4. If you are using PuTTY, select **WINDOWS** for **PLATFORM**.
   If you are using OpenSSH select **LINUX/MAC OS** for **PLATFORM**.
5. Click **Copy** to copy the string to the clipboard.
6. Paste the connection string copied from the previous step to PuTTY or your OpenSSH client and hit enter to connect to the console.
7. Hit enter again to activate the console.

Connecting to the VNC Console

Warning

The VNC console connection uses SSH port forwarding to create a secure connection from your local system to the VNC server attached to your instance's console. While this is a secure way to use VNC over the internet, owners of multiuser systems should be aware that opening a port on the local system makes it available to all of the users on that system until a VNC client connects. For this reason, we don't recommend using this product on a multiuser system unless you take proper actions to secure the port or you isolate the VNC client by running it in a virtual environment, such as Oracle VM VirtualBox.

Once you have created the console connection for the instance, you need to set up a secure tunnel to the VNC server on the instance, and then you can connect with a VNC client.

Note

VNC console connections for VM instances launched prior to October 13th, 2017

VNC console connections only work for VM instances launched on October 13th, 2017 or later.

Note

VNC console connections for bare metal instances launched prior to February 21, 2019

VNC console connections only work for bare metal instances launched on February 21st, 2019 or later, using one of the following shapes:

- BM.GPU2.2
- BM.HPC2.36
- BM.Standard2.52
- BM.DenseIO2.52

To set up a secure tunnel to the VNC server on the instance using OpenSSH on Mac OS X or Linux

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. Click the instance you want to connect to.
2. On the **Instances Details** page, in the **Resources** section, click **Console**

Connections.

3. Click the Actions icon (three dots), and then click **Connect with VNC**.
4. Select **LINUX/MAC OS** for **PLATFORM**.
5. Click **Copy** to copy the string to the clipboard.
6. Paste the connection string copied from the previous step to a terminal window on a Mac OS X or Linux system, and hit enter to set up the secure connection.
7. Once the connection has been established, open your VNC client and specify `localhost` as the host to connect to and `5900` as the port to use.

Note

Mac OS X Screen Sharing.app Not Compatible with VNC Console Connections

The Mac OS X built-in VNC client, Screen Sharing.app does not work with VNC console connections in Oracle Cloud Infrastructure. Use another VNC client, such as Real VNC Viewer or Chicken.

To set up a secure tunnel to the VNC server on the instance using PowerShell on Windows

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. Click the instance you want to connect to.
2. On the **Instances Details** page, in the **Resources** section, click **Console Connections**.
3. Click the Actions icon (three dots), and then click **Connect with VNC**.
4. Select **WINDOWS** for **PLATFORM**.
5. Click **Copy** to copy the string to the clipboard.

6. Paste the connection string copied from the previous step to Windows Powershell and hit enter to set up the secure connection.
7. Once the connection has been established, open your VNC client and specify `localhost` as the host to connect to and `5900` as the port to use.

Note

Secure Connection Warning

When you connect, you may see a warning from the VNC client that the connection is not encrypted. Since you are connecting through SSH, the connection is secure, so this is not an issue.

Troubleshooting Instances from Instance Console Connections

Once you are connected with an instance console connection, you can perform various tasks, such as:

- Edit system configuration files.
- Add or reset the SSH keys for the **opc** user.

Both of these tasks require you to boot into a bash shell, in maintenance mode.

Note

The following tasks describe steps specific to instances running Oracle Linux 7, connecting from OpenSSH. Other OS versions and SSH clients may require different steps.

To boot into maintenance mode

1. Reboot the instance from the Console
    - In the Console, on the **Instances Details page**, click **Reboot**.
2. Once the reboot process starts, switch back to the terminal window, and you see Console messages start to appear in the window. As soon as you see the GRUB boot menu appear, use the up/down arrow key to stop the automatic boot process, enabling you to use the boot menu.
3. In the boot menu, highlight the top item in the menu, and type `e` to edit the boot entry.
4. In edit mode, use the down arrow key to scroll down through the entries until you reach the line that starts with either `linuxefi` for instances running Oracle Linux 7.x, or `kernel` for instances running Oracle Linux 6.x.
5. At the end of that line, add the following:

    ```
    init=/bin/bash
    ```

6. Reboot the instance from the terminal window by entering the keyboard shortcut **CTRL+x**.

Once the instance has rebooted, you'll see the Bash shell command-line prompt, and you can proceed with either of the following procedures.

To edit the system configuration files

1. From the Bash shell, run the following command to load the SELinux policies to preserve the context of the files you are modifying:

    ```
    /usr/sbin/load_policy -i
    ```

2. Run the following command to remount the root partition with read/write permissions:

    ```
    /bin/mount -o remount, rw /
    ```

3. Edit the configuration files as needed to try to recover the instance.
4. Once you have finished editing the configuration files, to start the instance from the existing shell, run the following command:

```
exec /usr/lib/systemd/systemd
```

Alternatively, to reboot the instance, run the following command:

```
/usr/sbin/reboot -f
```

To add or reset the SSH key for the opc user

1. From the Bash shell, run the following command to load the SELinux policies to preserve the context of the files you are modifying:

   ```
   /usr/sbin/load_policy -i
   ```

2. Run the following command to remount the root partition with read/write permissions:

   ```
   /bin/mount -o remount, rw /
   ```

3. From the Bash shell, run the following command to change to the SSH key directory for the **opc** user:

   ```
   cd ~opc/.ssh
   ```

4. Rename the existing authorized keys file with the following command:

   ```
   mv authorized_keys authorized_keys.old
   ```

5. Replace the contents of the public key file with the new public key file with the following command:

   ```
   echo '<contents of .pub key file>' >> authorized_keys
   ```

6. Restart the instance by running the following command:

   ```
   /usr/sbin/reboot -f
   ```

Exiting the Instance Console Connection

To exit the serial console connection

When using SSH, the ~ character at the beginning of a new line is used as an escape

character.

- To exit the serial console, enter:

  ```
  ~.
  ```

- To suspend the SSH session, enter:

  ```
  ~^z
  ```

  The ^ character represents the **CTRL** key

- To see all the SSH escape commands, enter:

  ```
  ~?
  ```

To exit the VNC console connection

1. Close the VNC client.
2. In the Terminal or Powershell window, type `CTRL C`

Once you are finished using the console connection, delete the connection for the instance.

To delete the console connection for an instance

1. In the Console, on the **Instances Details** page, in the **Resources** section, click **Console Connections**.
2. Click the Actions icon (three dots), click **Delete**, and then click **OK** to confirm.

Adding Users on an Instance

If you created your instance using an Oracle-provided Linux or CentOS image, you can use SSH to access your instance from a remote host as the `opc` user. If you created your instance using the Ubuntu image, you can use SSH to access your instance from a remote host as the `ubuntu` user. After logging in, you can add users on your instance.

If you created your instance using an Oracle-provided Windows image, you can create new users after you log on to the instance through a Remote Desktop client.

Creating Additional SSH-Enabled Users on Linux Instances

If you do not want to share your SSH key, you can create additional SSH-enabled users:

- Generate SSH key pairs for the users offline.
- Add the new users.
- Append a public key to the `~/.ssh/authorized_keys` file for each new user.

Tip

If you re-create an instance from an Oracle-provided image, users and SSH public keys that you added or edited manually (that is, users that weren't defined in the machine image) must be added again.

If you need to edit the `~/.ssh/authorized_keys` file of a user on your instance, start a second SSH session before you make any changes to the file and ensure that it remains connected while you edit the file. If the `~/.ssh/authorized_keys` file becomes corrupted or you inadvertently make changes that lock you out of the instance, you can use the backup SSH session to fix or revert the changes. Before closing the backup SSH session, test all changes you made by logging in with the new or updated SSH key.

The new users then can SSH to the instance using the appropriate private keys.

To create an additional SSH-enabled user:

1. Generate an SSH key pair for the new user. See Managing Key Pairs on Linux Instances.
2. Copy the public key value to a text file for use later in this procedure.

3. Log in to your instance. See Connecting to an Instance.
4. Become the root user:

```
sudo su
```

5. Create the new user:

```
useradd <new_user>
```

6. Create a `.ssh` directory in the new user's home directory:

```
mkdir /home/<new_user>/.ssh
```

7. Copy the SSH public key that you saved to a text file into the `/home/new_user/.ssh/authorized_keys` file:

```
echo <public_key> > /home/<new_user>/.ssh/authorized_keys
```

8. Change the owner and group of the `/home/username/.ssh` directory to the new user:

```
chown -R <new_user>:<group> /home/<new_user>/.ssh
```

9. To enable `sudo` privileges for the new user, run the `visudo` command and edit the `/etc/sudoers` file as follows:
    a. In `/etc/sudoers`, look for:

```
%<username> ALL=(ALL) NOPASSWD: ALL
```

    b. Add the following line immediately after the preceding line:

```
%<group> ALL=(ALL) NOPASSWD: ALL
```

You can now log in as the new user.

Creating Additional Users on a Windows Instance

To create a new user on a Windows Instance:

1. Log in to your instance using a Remote Desktop client.
2. On the **Start** menu, click **Control Panel**.
3. Click **User Accounts**, and then click **User Accounts** again.
4. Click **Manage User Accounts**.
5. Click **Manage Another Account**.
6. Click **Add User Account**.
7. Enter a **User name** and **Password**.
8. Confirm the password, and then create a **Password hint**.
9. Click **Next**.
10. Verify the account, and then click **Finish**.

You can now log in as the new user.

Displaying the Console for an Instance

You can capture and display the serial console data for an instance. The data includes configuration messages that occur when the instance boots, such as kernel and BIOS messages, and is useful for checking the status of the instance or diagnosing problems. Note that the *raw* console data, including multi-byte characters, is captured.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to manage console history data. If the specified group doesn't need to launch instances or attach volumes, you could simplify that policy to include only `manage instance-family`, and remove the statements involving `volume-family` and `virtual-network-family`.

Using the API

For information about using the API and signing requests, see REST APIs.

Use these API operations to manage the serial console logs:

- CaptureConsoleHistory
- DeleteConsoleHistory
- GetConsoleHistory
- GetConsoleHistoryContent
- ListConsoleHistories

Getting Instance Metadata

The metadata for an instance includes its OCID, display name, compartment, shape, region, availability domain, creation date, state, image, and any custom metadata that you provide, such as an SSH public key.

You can find some of this information in the Console on the **Compute** page, or you can get all of it by logging in to the instance and using the metadata service. The service runs on every instance and is an HTTP endpoint listening on 169.254.169.254.

Required IAM Policy

No IAM policy is required if you're logged in to the instance and using Curl to get the metadata (see below).

For administrators: Users can also get instance metadata through the Compute API (e.g., with GetInstance). The policy in Let users launch Compute instances covers that ability. If the

specified group doesn't need to launch instances or attach volumes, you could simplify that policy to include only `manage instance-family`, and remove the statements involving `volume-family` and `virtual-network-family`.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Accessing Instance Metadata on Oracle-Provided Images

You can get instance metadata on Oracle-provided images by using curl on Linux instances or using an Internet browser for Windows instances.

Using Curl to Get Linux Instance Metadata

After you connect to an instance using SSH, issue any of the following GET requests. You'll get back a response that includes all of the instance information, only the custom metadata, or only the custom metadata for the specified key name, respectively.

```
curl -L http://169.254.169.254/opc/v1/instance/
```

```
curl -L http://169.254.169.254/opc/v1/instance/metadata/
```

```
curl -L http://169.254.169.254/opc/v1/instance/metadata/<key-name>
```

In the example *<key-name>*, is `ssh_authorized_keys`, `user_data`, or any custom key name that you provided when you launched the instance. (For information about using the Core Services API to provide `user_data` to Cloud-Init, see LaunchInstanceDetails.)

The following example shows all of the information for an instance.

```
{
  "id" : "ocid1.instance.oc1.phx.abyhqljrkfpg67546xizk4welg3n4yft4hkud6hrdj5tietdnt7s4inffjoq",
  "displayName" : "rprods",
  "compartmentId" :
"ocid1.compartment.oc1..aaaaaaaal3gzijdhqol2pglie6astxxeyqdqeyg35nz5zxil2rggnx7jnhwa",
  "shape" : "x5-2.36.512",
  "region" : "phx",
  "availabilityDomain" : "cumS:PHX-AD-1",
```

```
  "timeCreated" : "2016-04-18T20:02:38.383+0000",
  "state" : "RUNNING",
  "image" : null,
  "metadata": {
      "ssh_authorized_keys" : "ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAACAQCZ06fccNTQfq+JNL

    "user_data" : "SWYgeW91IGNhbiBzZWUgdGhpcywgdGhlbiBZdCB3b3JrZWQgbWF5YmUuCg=="
}
```

Using an Internet Browser to Get Windows Instance Metadata

After you connect to a Windows instance, you can open an Internet browser such as Microsoft Edge or Internet Explorer, Google Chrome, or Mozilla Firefox, and then navigate to the following URLs:

- http://169.254.169.254/opc/v1/instance/
- http://169.254.169.254/opc/v1/instance/metadata/
- http://169.254.169.254/opc/v1/instance/metadata/*<key-name>*

In the example *<key-name>*, is `user_data` or any custom key name that you provided when you launched the instance.

Updating Instance Metadata

The Oracle Cloud Infrastructure Compute service lets you add and update custom metadata for an instance using the Command Line Interface (CLI) or REST APIs.

When you create an instance using the LaunchInstance operation you can specify custom metadata for the instance in the LaunchInstanceDetails datatype's `metadata` or `extendedMetadata` attributes. To update an instance's metadata, use the UpdateInstance operation, specifying the custom metadata in the UpdateInstanceDetails datatype's `metadata` or `extendedMetadata` attributes. The `metadata` attribute supports key/value string pairs while the `extendedMetadata` attribute supports nested JSON objects.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to rename an instance. If the specified group doesn't need to launch instances or attach volumes, you could simplify that policy to include only `manage instance-family`, and remove the statements involving `volume-family` and `virtual-network-family`.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the API

When you use the `UpdateInstance` operation, the instance's metadata will be the combination of the values specified in the UpdateInstanceDetails datatype's `metadata` or `extendedMetadata` attributes. Any set of key/value pairs specified for these attributes in the `UpdateInstance` operation will replace the existing values for these attributes, so you need to include all the metadata values for the instance in each call, not just the ones you want to add. If you leave the attribute empty when calling `UpdateInstance`, the existing metadata values in that attribute will be used. You cannot specify a value for the same metadata key twice, this will cause the `UpdateInstance` operation to fail due to there being duplicate keys.

To understand this, consider the example scenario where you created an instance using the `LaunchInstance` operation and specified the following key/value pair for the `metadata` attribute:

```
"myCustomMetadataKey" : "myCustomMetadataValue"
```

If you then call the `UpdateInstance` operation, and add new metadata by specifying additional key/value pairs in the `extendedMetadata` attribute, but you leave the `metadata` attribute empty, do not include the `myCustomMetadataKey` key/value in the `extendedMetadata` attribute, as this will cause the operation to fail since that key already exists. If you do specify values for the metadata attribute, you need to include the `myCustomMetadataKey` key/value to maintain it in the instance's metadata. In this case, you can specify it in either of the attributes.

There are two reserved keys, `user_data` and `ssh_authorized_keys`, that can only be set for an instance at launch time, they cannot be updated later. If you use the metadata attribute to add or update metadata to an instance, you need to ensure that you include the values specified at launch time for both these keys, otherwise the `UpdateInstance` operation will fail.

Best Practices for Updating an Instance's Metadata

When using the `UpdateInstance` operation, Oracle recommends the following:

- Use the GetInstance operation to retrieve the existing custom metadata for the instance to ensure that you include the values you want to maintain in the appropriate attributes when you call `UpdateInstance`. The metadata values are returned in the `metadata` and `extendedMetadata` attributes for the Instance . For a code example demonstrating this, see the UpdateInstanceExample in the SDK for Java.
- Unless you are updating custom metadata that was added using the `metadata` attribute, use the `extendedMetadata` attribute to add custom metadata. Otherwise you need to include the launch time values for the `user_data` and `ssh_authorized_keys` reserved keys. If you use the `metadata` attribute to add values and you leave out the values for these reserved keys or specify different values for them, the `UpdateInstance` call will fail.

Renaming an Instance

You can rename an instance without changing its Oracle Cloud Identifier (OCID).

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to rename an instance. If the specified group doesn't need to launch instances or attach volumes, you could simplify that policy to include only `manage instance-family`, and remove the statements involving `volume-family` and `virtual-network-family`.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the UpdateInstance operation to change the name of an instance.

Moving a Compute Instance

This topic covers how to relocate a virtual machine or a bare metal instance by using reboot migration or a manual process.

Reboot Migration

For instances with a date in the **Reboot Maintenance** field (available in the Console, CLI, and SDKs), you can reboot your instance to move it to new infrastructure. After you reboot the instance, the **Reboot Maintenance** field is cleared. This change indicates that the instance was moved successfully.

Before the reboot, detach all paravirtualized or emulated block volumes and delete all secondary VNIC attachments. Left in place, these attachments can prevent the service from moving your instance. After the reboot, you can reattach block volumes and secondary VNICs.

Limitations and Warnings for Reboot Migration

Any public IP addresses assigned to secondary VNICs from a reserved public pool are retained. Public IP addresses that were not assigned from a reserved public IP pool will change. Private IP addresses do not change.

Prerequisites for Reboot Migration

1. Determine if your instance has any paravirtualized or emulated remote block volume attachments:
    a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
    b. Click the name of the instance you want to move.
    c. On the **Instance Details** page, click **Attached Block Volumes**.
    d. Note the **Attachment Type** for each volume.
2. Document any remote block volumes attached to the instance.
3. Determine if your instance has any secondary VNIC attachments:
    a. On the **Instance Details** page, click **Attached VNICs**.

b. Excluding the first VNIC, document all private IP addresses, names, subnets, and tags on each VNIC. Note that the instance can have multiple VNICs, and each VNIC can have multiple secondary IP addresses.

c. Excluding the first VNIC, document any public IP addresses assigned from a reserved public pool. Note that the instance can have multiple VNICs, and each VNIC can have multiple secondary private IP addresses. Each VNIC and secondary private IP address can have an attached public IP address.

4. Prepare the instance for reboot migration:
   - Ensure that any remote block volumes defined in `/etc/fstab` use the recommended options.
   - Ensure that any File Storage service (NFS) mounts use the `nofail` option.
   - If you have statically defined any network interfaces belonging to secondary VNICs using their MAC addresses, such as those defined in `/etc/sysconfig/network-scripts/ifcfg*`, those interfaces will not start due to the change in the MAC address. Remove the static mapping.
   - If you use the Oracle-provided script to configure secondary VNICs, ensure it runs automatically at startup.

Moving an Instance with Reboot Migration

After you complete the prerequisites:

1. Stop any running applications.
2. Ensure that those applications will not start automatically.

Warning

When the relocated instance starts for the first time, remote block volumes and secondary VNICs, or any resource that relies on them, will not be attached. The absence of these resources can cause application issues.

3. Unmount any remote block volumes or File Storage service (NFS) mounts.
4. Detach any paravirtualized or emulated remote block volumes.
5. Delete all secondary VNICs.
6. Back up all remote block volumes. See Backing Up a Volume for more information.
7. Reboot the instance.
8. Confirm that the **Reboot Maintenance** field no longer has a date.
9. Reattach any remote block volumes.
10. Recreate any secondary VNICs, including tags.
11. Start and test any applications on the instance.
12. Configure the applications to start automatically, as required.
13. (Optional) After you confirm that the instance and applications are healthy, you can delete the volume backups.

Moving an Instance with Manual Migration

For instances without a date in the **Reboot Maintenance** field (available in the Console, CLI, and SDKs), you must move the instance manually. This method requires that you terminate the instance, and then launch a new instance from the retained boot volume. Instances that have additional VNICs, secondary IP addresses, remote attached block volumes, or that belong to a backend set of a load balancer require additional steps.

Limitations and Warnings for Manual Migration

Be aware of the following limitations and warnings when performing a manual migration:

- Any public IP addresses assigned to your instance from a reserved public pool are retained. Any that were not assigned from a reserved public IP address pool will change. Private IP addresses do not change.
- MAC addresses, CPUIDs, and other unique hardware identifiers do change during the move. If any applications running on the instance use these identifiers for licensing or other purposes, be sure to take note of this information before moving the instance to help you manage the change.

Prerequisites for Manual Migration

1. Before moving the instance, document all critical details:
    - The instance's region, availability domain, and fault domain.
    - The instance's display name.
    - All private IP addresses, names, and subnets. Note that the instance can have multiple VNICs, and each VNIC can have multiple secondary IP addresses.
    - All private DNS names. The instance can have multiple VNICs, and each VNIC can have multiple secondary IP addresses. Each private IP address can have a DNS name.
    - Any public IP addresses assigned from a reserved public pool. Note that the instance can have multiple VNICs, and each VNIC can have multiple secondary private IP addresses. Each VNIC and secondary private IP address can have an attached public IP address.
    - Any remote block volumes attached to the instance.
    - Any tags on the instance or attached resources.
2. Prepare the instance for manual migration:
    - Ensure that any remote block volumes defined in `/etc/fstab` use the recommended options.

- Ensure that any File Storage service (NFS) mounts use the `nofail` option.
- If you have statically defined any network interfaces belonging to secondary VNICs using their MAC addresses, such as those defined in `/etc/sysconfig/network-scripts/ifcfg*`, those interfaces will not start due to the change in the MAC address. Remove the static mapping.
- If you use the Oracle-provided script to configure secondary VNICs, ensure it runs automatically at startup.

Moving an Instance Manually

After you complete the prerequisites:

1. Stop any running applications.
2. Ensure that those applications will not start automatically.

Warning

When the relocated instance starts for the first time, remote block volumes, secondary VNICs, or any resource that relies on them, will not be attached. The absence of these resources can cause application issues.

3. If your instance has local NVMe storage (dense instances), you must back up this data:
   a. Create and attach one or more remote block volumes to the instance.
   b. Copy the data from the NVMe devices to the remote block volumes.
4. Unmount any remote block volumes or File Storage service (NFS) mounts.
5. Back up all remote block volumes. See Overview of Block Volume Backups for more information.
6. Create a backup of the root volume.

Important

Do not generalize or specialize Windows instances.

7. Terminate the instance:

Using the Console

a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.

b. In the list of instances, find the instance you want to terminate.

c. Click the highlighted name of the instance to display the instance details.

d. Click **Terminate**, and then respond to the confirmation prompt. Ensure that `Permanently delete the attached Boot Volume` is unchecked to preserve the boot volume associated with the instance.
Terminated instances temporarily remain in the list of instances with the status **Terminated**.

Using the API

To terminate the instance, use the TerminateInstance operation and pass the `preserveBootVolume` parameter set to `true` in the request.

Using the CLI

To terminate the instance, use the terminate operation and set the `preserve-boot-volume` option to `true`.

8. Create a new instance using the boot volume from the terminated instance.

9. In the launch instance flow, specify the private IP address that was attached to the primary VNIC. If the public IP address was assigned from a reserved IP address pool, be sure to assign the same IP address.
10. When the instance state changes to `RUNNING`, **Stop** the instance.
11. Recreate any secondary VNICs and secondary IP addresses.
12. Attach any remote block volumes.

Note

This step includes any volumes used to back up local NVMe devices. Copy the data onto the NVMe storage on the new instance, and then detach the volumes.

13. Start the instance.
14. Start and test any applications on the instance.
15. Configure the applications to start automatically, as required.
16. Recreate the required tags.
17. (Optional) After you confirm that the instance and applications are healthy, you can delete the volume backups.

Migrating an Instance from a Local to Remote Boot Volume

Oracle Cloud Infrastructure introduced remote boot volumes November 15th, 2017. Remote boot volumes include significant improvements over local boot volumes including lower boot times, encryption of data at rest and in-transit, zero downtime snapshots, improved availability, and more. Instances launched prior to November 15th, 2017 use local boot volumes. Local boot volumes are being deprecated, we recommend that you migrate any instances currently using a local boot volume to a remote boot volume. This topic describes that process.

Limitations and Warnings for Manual Migration

Be aware of the following limitations and warnings when performing a manual migration:

- Any public IP addresses assigned to your instance from a reserved public pool are retained. Any that were not assigned from a reserved public IP address pool will change. Private IP addresses do not change.
- MAC addresses, CPUIDs, and other unique hardware identifiers do change during the move. If any applications running on the instance use these identifiers for licensing or other purposes, be sure to take note of this information before moving the instance to help you manage the change.

Prerequisites for Manual Migration

1. Before moving the instance, document all critical details:
    - The instance's region, availability domain, and fault domain.
    - The instance's display name.
    - All private IP addresses, names, and subnets. Note that the instance can have multiple VNICs, and each VNIC can have multiple secondary IP addresses.
    - All private DNS names. The instance can have multiple VNICs, and each VNIC can have multiple secondary IP addresses. Each private IP address can have a DNS name.
    - Any public IP addresses assigned from a reserved public pool. Note that the instance can have multiple VNICs, and each VNIC can have multiple secondary private IP addresses. Each VNIC and secondary private IP address can have an attached public IP address.
    - Any remote block volumes attached to the instance.
    - Any tags on the instance or attached resources.
2. Prepare the instance for manual migration:
    - Ensure that any remote block volumes defined in `/etc/fstab` use the recommended options.

- Ensure that any File Storage service (NFS) mounts use the `nofail` option.
- If you have statically defined any network interfaces belonging to secondary VNICs using their MAC addresses, such as those defined in `/etc/sysconfig/network-scripts/ifcfg*`, those interfaces will not start due to the change in the MAC address. Remove the static mapping.
- If you use the Oracle-provided script to configure secondary VNICs, ensure it runs automatically at startup.

Migrating an Instance Manually

After you complete the prerequisites:

1. Stop any running applications.
2. Ensure that those applications will not start automatically.

Warning

When the relocated instance starts for the first time, remote block volumes, secondary VNICs, or any resource that relies on them, will not be attached. The absence of these resources can cause application issues.

3. If your instance has local NVMe storage (dense instances), you must back up this data:
   a. Create and attach one or more remote block volumes to the instance.
   b. Copy the data from the NVMe devices to the remote block volumes.
4. Unmount any remote block volumes or File Storage service (NFS) mounts.
5. Back up all remote block volumes. See Overview of Block Volume Backups for more information.
6. Create a custom image of the instance using the steps described in the Using the Console or Using the API sections of Managing Custom Images.

Important

Do not generalize or specialize Windows instances.

7. Terminate the instance:

Using the Console

a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.

b. In the list of instances, find the instance you want to terminate.

c. Click the highlighted name of the instance to display the instance details.

d. Click **Terminate**, and then respond to the confirmation prompt. Ensure that `Permanently delete the attached Boot Volume` is unchecked to preserve the boot volume associated with the instance.
Terminated instances temporarily remain in the list of instances with the status **Terminated**.

Using the API

To terminate the instance, use the TerminateInstance operation and pass the `preserveBootVolume` parameter set to `true` in the request.

Using the CLI

To terminate the instance, use the terminate operation and set the `preserve-boot-volume` option to `true`.

8. Create a new instance using the custom image from the terminated instance, see the steps described in the Using the Console or the Using the API sections of Managing Custom Images.

9. In the launch instance flow, specify the private IP address that was attached to the primary VNIC. If the public IP address was assigned from a reserved IP address pool, be sure to assign the same IP address.
10. When the instance state changes to `RUNNING`, **Stop** the instance.
11. Recreate any secondary VNICs and secondary IP addresses.
12. Attach any remote block volumes, see Attaching a Volume for more information.

Note

This step includes any volumes used to back up local NVMe devices. Copy the data onto the NVMe storage on the new instance, and then detach the volumes.

13. Start the instance.
14. Start and test any applications on the instance.
15. Configure the applications to start automatically, as required.
16. Recreate the required tags.
17. (Optional) After you confirm that the instance and applications are healthy, you can delete the volume backups.

Stopping and Starting an Instance

You can stop and start an instance as needed to update software or resolve error conditions.

Stopping or Restarting an Instance From Within the Instance

In addition to using the API and Console, you can stop and restart instances using the commands available in the operating system when you are logged in to the instance. Stopping an instance from within the instance does not stop billing for that instance. If you stop an instance this way, be sure to also stop it from the Console or API.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to stop or start an existing instance. If the specified group doesn't need to launch instances or attach volumes, you could simplify that policy to include only `manage instance-family`, and remove the statements involving `volume-family` and `virtual-network-family`.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Rebooting Your Virtual Machine (VM) Instance During Planned Maintenance

When an underlying Oracle Cloud Infrastructure component needs to undergo maintenance, you are notified in advance of the impact to your VM instances. If your VM instances are scheduled for a maintenance reboot, you can pro-actively reboot, or stop and start your instances using the Console, API, or CLI at any time before the scheduled reboot. This allows you to control how and when your applications experience downtime.

To identify VM instances that can be pro-actively rebooted using the Console, check the **Maintenance Reboot** field for the instance. If the instance has a maintenance reboot scheduled and can be proactively rebooted, this field displays the date and start time for the reboot. To check this using the API, use the `timeMaintenanceRebootDue` field for the Instance. For VM instances with a boot volume, additional iSCSI block volume attachments, and a single VNIC, you can proceed to reboot, or stop and start the instance. If you have non-iSCSI (paravirtualized or emulated) block volume attachments or secondary VNICs, you need to first detach these resources before you reboot your instance.

When you reboot, or stop and start the instance, it will be migrated to a different physical VM host. Once the **Maintenance Reboot** field is blank, the instance will no longer be impacted by the maintenance event. If you choose not to reboot before the scheduled time, then Oracle Cloud Infrastructure will reboot and migrate your instances within a 24-hour period after the scheduled time.

To make it easier to locate and perform these actions on your VM instances, you can use Search with a predefined query to find all instances that have a maintenance reboot scheduled.

To find all the instances scheduled for a maintenance reboot

1. In the Console, append "/a/query" to the end of your base Console URL. For example, https://console.us-ashburn-1.oraclecloud.com/a/query.
2. Click **Select Sample Query**, and then click **Query for all instances which have an upcoming scheduled maintenance**.

Note

The **Maintenance Reboot** field is supported on all standard VM instances running Linux-based operating systems. For VM instances running other operating systems, follow the instructions in the Oracle Cloud Infrastructure maintenance notification email.

Resource Billing for Stopped Instances

For both VM and bare metal instances, billing depends on the shape that you use to create the instance:

- **Standard shapes:** Stopping an instance pauses billing. However, stopped instances continue to count toward your service limits.

- **Dense I/O shapes:** Billing continues for stopped instances because of the attached NVMe storage, and related resources continue to count toward your service limits. To halt billing and remove related resources from your service limits, you must terminate the instance.
- **GPU shapes:** Stopping an instance pauses billing. However, stopped instances continue to count toward your service limits.
- **HPC shapes:** Billing continues for stopped instances because of the attached NVMe storage, and related resources continue to count toward your service limits. To halt billing and remove related resources from your service limits, you must terminate the instance.

Stopping an instance from within the instance does not stop billing for that instance. If you stop an instance this way, be sure to also stop it from the Console or API.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. In the list of instances, find the instance you want to stop or start, and then click the instance name to display the instance details.
3. Click one of the following actions:

START

Restarts a stopped instance. After the instance is restarted, the **Stop** action is enabled.

STOP

Shuts down the instance. After the instance is powered off, the **Start** action is enabled.

REBOOT

Shuts down the instance, and then restarts it.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the InstanceAction operation to restart an instance.

The following actions are only available using the API:

- SOFTSTOP
- SOFTRESET

Terminating an Instance

You can permanently terminate (delete) instances that you no longer need. Any attached VNICs and volumes are automatically detached when the instance terminates. Eventually, the instance's public and private IP addresses are released and become available for other instances. By default, the instance's boot volume is deleted when you terminate the instance, however you can preserve the boot volume associated with the instance, so that you can attach it to a different instance as a data volume, or use it to launch a new instance.

Warning

If your instance has NVMe storage, terminating it securely erases the NVMe drives and the data that was on those drives becomes completely unrecoverable. Make sure you back up important data before terminating an instance. For more information, see Protecting Data on NVMe Devices.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users launch Compute instances includes the ability to terminate an instance (with or without an attached block volume).

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for instances, cloud networks, or other Core Services API resources, see Details for the Core Services.

Using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. In the list of instances, find the instance you want to terminate.
3. Click the highlighted name of the instance to display the instance details.
4. Click **Terminate**, and then respond to the confirmation prompt.
   If you want to preserve the boot volume associated with the instance, uncheck `Permanently delete the attached Boot Volume`.
   Terminated instances temporarily remain in the list of instances with the status **Terminated**.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the TerminateInstance operation to terminate an instance.

Enabling Monitoring for Compute Instances

This topic describes how to enable monitoring for Compute instances that use supported images.

Warning

Avoid entering confidential information when assigning descriptions, tags, or friendly names to your cloud resources through the Oracle Cloud Infrastructure Console, API, or CLI.

Except for Compute instances, all resources that support the Monitoring service emit metrics by default. A Compute instance using a supported image emits metrics when it has the required instance configuration and OracleCloudAgent software.

Supported Images

Only Compute instances with supported images provide the configuration setting to enable monitoring. When this setting is enabled for an instance and the OracleCloudAgent software is installed on the instance, the instance emits metrics.

Note

Because legacy images require installation of the OracleCloudAgent software, we recommend selecting the latest image, which already has the software installed. If you need a legacy image, then select an image dated on or after November 16, 2018 (except Ubuntu, which must be a new image).

- CentOS 6 (named CentOS-6.*x*-<*date*>-<*number*>)
- CentOS 7 (named CentOS-7-<*date*>-<*number*>)
- Oracle Linux 6 (Oracle Linux 6 Unbreakable Enterprise Kernel Release 4, named Oracle-Linux-6.*x*-<*date*>-<*number*>)
- Oracle Linux 7.x (Oracle Linux 7 Unbreakable Enterprise Kernel Release 4, named Oracle-Linux-7.*x*-<*date*>-<*number*)
- Ubuntu 14.04 (named Canonical-Ubuntu-14.04-<*date*>-<*number*>)
- Ubuntu 16.04 (named Canonical-Ubuntu-16.04-<*date*>-<*number*>)
- Ubuntu 18.04 (named Canonical-Ubuntu-18.04-<*date*>-<*number*>)
- Windows Server 2008 R2 (named Windows-Server-2008-R2-Enterprise-Edition-VM-<*date*>-<*number*)
- Windows Server 2012 R2 (named Windows-Server-2012-R2-<*edition*>-<*gen*>.<*date*>-<*number*)
- Windows Server 2016 (named Windows-Server-2016-<*edition*>-Gen2.<*date*>-<*number*>)

Prerequisites

- Service gateways or public IP addresses: The Compute instances must have either service gateways or public IP addresses to send metrics to the Monitoring service.
- IAM policies: To create and update Compute instances, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in. For more information, see Creating an Instance.
- SSH: To connect to a Compute instance, you must have an SSH key. For more information, see Connecting to an Instance.

Process Overview: Enabling Monitoring for a New Compute Instance

Following is the process for configuring a new Compute instance to emit metrics.

Task 1: Create a monitoring-enabled instance

Steps depend on the date of the image used to create the instance.

Latest version of supported image

Note

Like the latest version, some recent versions of supported images also have the OracleCloudAgent software installed. Compare to the date listed in Supported Images.

While defining properties for the new instance, set the property that enables the instance for monitoring. For instructions, see Using the Console or Using the API.

Legacy version of supported image

A legacy version of a supported image is one provided before the date listed in Supported Images.

While defining properties for the new instance, set the property that enables the instance for monitoring and do one of the following:

- In the Console: While defining properties for the new instance, provide a script to install the OracleCloudAgent software onto the instance during the instance creation process.
- Complete the instance creation process and then manually install the OracleCloudAgent software.

Task 2: (Optional) Create a service gateway

If your instances do not have public IP addresses, set up a service gateway on the virtual cloud network (VCN). The service gateway allows the instances to send metrics to the Monitoring service without the traffic going over the internet. Here are special notes for setting up the service gateway to access the Monitoring service:

- When creating the service gateway, enable the service label called **All <region> Services in Oracle Services Network**. It includes the Monitoring service.
- When setting up routing for the subnet that contains your instances, set up a route rule with **Target Type** set to **Service Gateway**, and the **Destination Service** set to **All <region> Services in Oracle Services Network**.

For detailed instructions, see Setting Up a Service Gateway in the Console.

Find Out if Monitoring Has Your Metrics

To find out if Monitoring has your metrics

This task involves either querying instance metrics or viewing instance configuration.

- Query metrics to determine if Monitoring is receiving metrics emitted by the instance. For instructions, see Using the Console or Using the API.

Not seeing metrics for your instance?

If you don't see any metric charts, your Compute instance might not be emitting metrics. See the following possible causes and resolutions.

Possible cause	How to check	Resolution
Monitoring is disabled on the instance.	Review the instance configuration.	Enable monitoring.
No OracleCloudAgent software exists on the instance (occurs with older images).	Connect to the instance and look for the software.	Install the software.
The instance cannot access theMonitoring service because its VCN does not use the Internet.	Review the instance's IP address. If it's not public, then a service gateway is needed.	Set up a service gateway.

Possible cause	How to check	Resolution
The instance does not use a supported image.	Review Supported Images.	Create an instance with a supported image.
New instance in a new compartment: The IAM policies required for the instance to publish metrics to Monitoring are not yet initialized. More information: IAM policies are automatically created for new instances and are immediately available, unless the instances are in a new compartment. For a new instance in a new compartment, the policies can take up to 20 minutes to initialize, which delays the emission of metrics.	(not applicable)	Check back after 10 or 20 minutes.

- View the instance configuration to determine if monitoring is enabled. Monitoring-enabled instances may require installation of the OracleCloudAgent software before metrics are emitted. For instructions, see Using the Console or Using the API.

Process Overview: Enabling Monitoring for an Existing Compute Instance

Following is the process for configuring an existing Compute instance to emit metrics.

Task 1: Enable monitoring

Update the instance configuration to enable monitoring. For instructions, see Using the Console or Using the API.

Task 2: Install the OracleCloudAgent software

Choose the operating system corresponding to the instance.

Linux

This section covers CentOS, Linux, and Ubuntu images.

1. Enable monitoring on the instance.
2. Connect to the instance.
   For step-by-step instructions, see Connecting to an Instance.
3. Run the script corresponding to the image used by the instance.

CentOS 6.x, Oracle Linux 6.x

```
#!/bin/sh

cd ~
curl -O https://objectstorage.us-phoenix-
1.oraclecloud.com/p/bUGHSOrPjZalGUX3Lmpe7BS6oKzEQF86XuIFwOJVXAs/n/imagegen/b/agents/o/oracle-
cloud-agent-0.0.8-176.el6.x86_64.rpm -v
```

CentOS 7.x, Oracle Linux 7.x

```
#!/bin/sh

cd ~
curl -O https://objectstorage.us-phoenix-1.oraclecloud.com/p/IX8WN_S_
AJtA4kcThoambuQ4nYkim4Z7Ml1mW9l_nIo/n/imagegen/b/agents/o/oracle-cloud-agent-0.0.8-176.el7.x86_
64.rpm -v
```

Ubuntu 14.04, 16.04, 18.04

Note

Installation of the OracleCloudAgent software on instances using Ubuntu images requires Snapcraft. To install Snapcraft, run the following commands, in sequence:

```
sudo apt update
```

```
sudo apt install snapd
```

```
sudo snap install oracle-cloud-agent --classic
```

4. Enter the relevant command to run the OracleCloudAgent software on the instance.

Example 1: CentOS or Oracle Linux image

```
sudo yum install -y <instance-agent-filename>
```

Example 2: Ubuntu image

(Same instructions as noted in the previous step: This command installs and runs the software.)

```
sudo snap install oracle-cloud-agent --classic
```

Metrics are now emitted by the instance.

Windows

1. Enable monitoring on the instance.

2. Download the OracleCloudAgent software from the following URL.
   https://objectstorage.us-phoenix-1.oraclecloud.com/p/RDDCRrNTo5WB19mI52QJTOXCq1whXFZHXCQP74b4ttg/n/imagegen/b/windows_instance_agents/o/OracleCloudAgentSetup.msi
3. Connect to the instance.
   For step-by-step instructions, see Connecting to an Instance.
4. Copy the downloaded OracleCloudAgent software to the instance.
5. Enter the relevant command to run the OracleCloudAgent software on the instance.

   ```
   msiexec /i /s <instance-agent-filename>
   ```

   Metrics are now emitted by the instance.

Task 3: (Optional) Create a service gateway

If your instances do not have public IP addresses, set up a service gateway on the virtual cloud network (VCN). The service gateway allows the instances to send metrics to the Monitoring service without the traffic going over the internet. Here are special notes for setting up the service gateway to access the Monitoring service:

- When creating the service gateway, enable the service label called **All <region> Services in Oracle Services Network**. It includes the Monitoring service.
- When setting up routing for the subnet that contains your instances, set up a route rule with **Target Type** set to **Service Gateway**, and the **Destination Service** set to **All <region> Services in Oracle Services Network**.

For detailed instructions, see Setting Up a Service Gateway in the Console.

Using the Console

Use the Console to create a Compute instance with monitoring enabled and, for new instances using legacy images, to run the script that installs the required OracleCloudAgent software.

To create a monitoring-enabled instance

Steps depend on the date of the image used to create the instance.

Latest version of supported image

Note

Like the latest version, some recent versions of supported images also have the OracleCloudAgent software installed. Compare to the date listed in Supported Images.

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. Choose a **Compartment** you have permission to work in, and then click **Create Instance**.
2. In the **Create Instance** dialog box, select the latest version of a supported image. For more information about launching instances, see Creating an Instance.
3. Select **Enable monitoring**.
4. Update other configuration as needed and then click **Create Instance**. The newly created monitoring-enabled instance emits metrics to the Monitoring service.

Legacy version of supported image

A legacy version of a supported image is one provided before the date listed in Supported Images. Legacy images require you to install the OracleCloudAgent software.

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**. Choose a **Compartment** you have permission to work in, and then click

Create Instance.

2. In the **Create Instance** dialog box, select the legacy version of the supported image. For more information about launching instances, see Creating an Instance.
3. Select **Enable monitoring**.
4. Click **Show Advanced Options**.
5. Select **Paste cloud-init script**.
6. Copy and paste the script corresponding to the image used by the instance.

CentOS 6.x, Oracle Linux 6.x

```
#!/bin/sh
curl -O https://objectstorage.us-phoenix-
1.oraclecloud.com/p/bUGHSOrPjZalGUX3Lmpe7BS6oKzEQF86XuIFwOJVXAs/n/imagegen/b/agents/o/oracle-
cloud-agent-0.0.8-176.el6.x86_64.rpm
yum install -y ~/oracle-cloud-agent-0.0.8-176.el6.x86_64.rpm -v
```

CentOS 7.x, Oracle Linux 7.x

```
#!/bin/sh
curl -O https://objectstorage.us-phoenix-1.oraclecloud.com/p/IX8WN_S_
AJtA4kcThoambuQ4nYkim4Z7Ml1mW9l_nIo/n/imagegen/b/agents/o/oracle-cloud-agent-0.0.8-176.el7.x86_
64.rpm -v
yum install -y ~/oracle-cloud-agent-0.0.8-176.el7.x86_64.rpm -v
```

Windows Server 2012 R2, 2016

Note

For legacy versions of Windows images, make sure cloudbase-init is supported. See https://docs.cloud.oracle.com/iaas/releasenotes/changes/595afbb7-de0c-4934-8074-5b1ed6be1b56/.

```
#ps1_sysnative
cd \Users\opc\Desktop
Start-BitsTransfer -Source "https://objectstorage.us-phoenix-
1.oraclecloud.com/p/RDDCRrNTo5WB19mI52QJTOXCq1whXFZHXCQP74b4ttg/n/imagegen/b/windows_instance_
agents/o/OracleCloudAgentSetup.msi" -Destination
"c:\Users\opc\Desktop\OracleCloudAgentSetup.msi"
msiexec /i "c:\Users\opc\Desktop\OracleCloudAgentSetup.msi" /quiet /L*V
"c:\Users\opc\Desktop\OracleCloudAgentSetup.log"
```

Windows Server 2008 R2

Download the OracleCloudAgent software from the following URL and manually install it on the instance.

https://objectstorage.us-phoenix-1.oraclecloud.com/p/RDDCRrNTo5WB19mI52QJTOXCq1whXFZHXCQP74b4ttg/n/imagegen/b/windows_instance_agents/o/OracleCloudAgentSetup.msi

Ubuntu 14.04, 16.04, 18.04

Note

Installation of the OracleCloudAgent software on instances using Ubuntu images requires Snapcraft. To install Snapcraft, run the following commands, in sequence:

```
sudo apt update
```

```
sudo apt install snapd
```

```
sudo snap install oracle-cloud-agent --classic
```

7. Update other configuration as needed and then click **Create Instance**.
   The newly created monitoring-enabled instance emits metrics to the Monitoring service.

To find out if monitoring is enabled or if Monitoring is receiving metrics

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. Click the instance you're interested in.
3. On the instance detail page, under **Resources**, click **Metrics**.
   If you see metric charts with data, then the Monitoring service is receiving metrics from this instance. For a list of metrics related to Compute instances, see Compute Metrics.
   If you see a message that monitoring is not enabled, or that the OracleCloudAgent software needs to be installed, then complete those tasks.

To enable monitoring on an existing instance

1. Go to the Metrics page for the instance:
   a. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
   b. Click the instance you're interested in.
   c. On the instance detail page, under **Resources**, click **Metrics**.
      If monitoring is not enabled (and the instance uses a supported image), then a button is available for enabling monitoring.
2. Click **Enable monitoring**.
   If you see metric charts with data, then the Monitoring service is receiving metrics from this instance. For a list of metrics related to Compute instances, see Compute Metrics.
   If you see a message that the OracleCloudAgent software needs to be installed, then see Task 2: Install the OracleCloudAgent software.

Using the API

Use the API to enable monitoring on a new or existing instance. After monitoring is enabled, you can install the OracleCloudAgent software.

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

To create a monitoring-enabled instance

Steps depend on the date of the image used to create the instance.

Latest version of supported image

Note

Like the latest version, some recent versions of supported images also have the OracleCloudAgent software installed. Compare to the date listed in Supported Images.

Use the LaunchInstance API operation, specifying the latest version of a supported image, and include the following parameter setting.

```
{
  "agentConfig":
  {
    "isMonitoringDisabled":false
  }
}
```

Legacy version of supported image

A legacy version of a supported image is one provided before the date listed in Supported Images. Legacy images require you to install the OracleCloudAgent software.

1. Use the LaunchInstance API operation, specifying the legacy version of the supported image, and include the following parameter setting.

```
{
  "agentConfig":
  {
    "isMonitoringDisabled":false
  }
}
```

2. Install the OracleCloudAgent software onto the newly created instance. See Task 2: Install the OracleCloudAgent software.

To find out if monitoring is enabled or if Monitoring is receiving metrics

To query metrics, use the SummarizeMetricsData API operation. Returned metrics indicate that the Monitoring service received metrics from the instance.

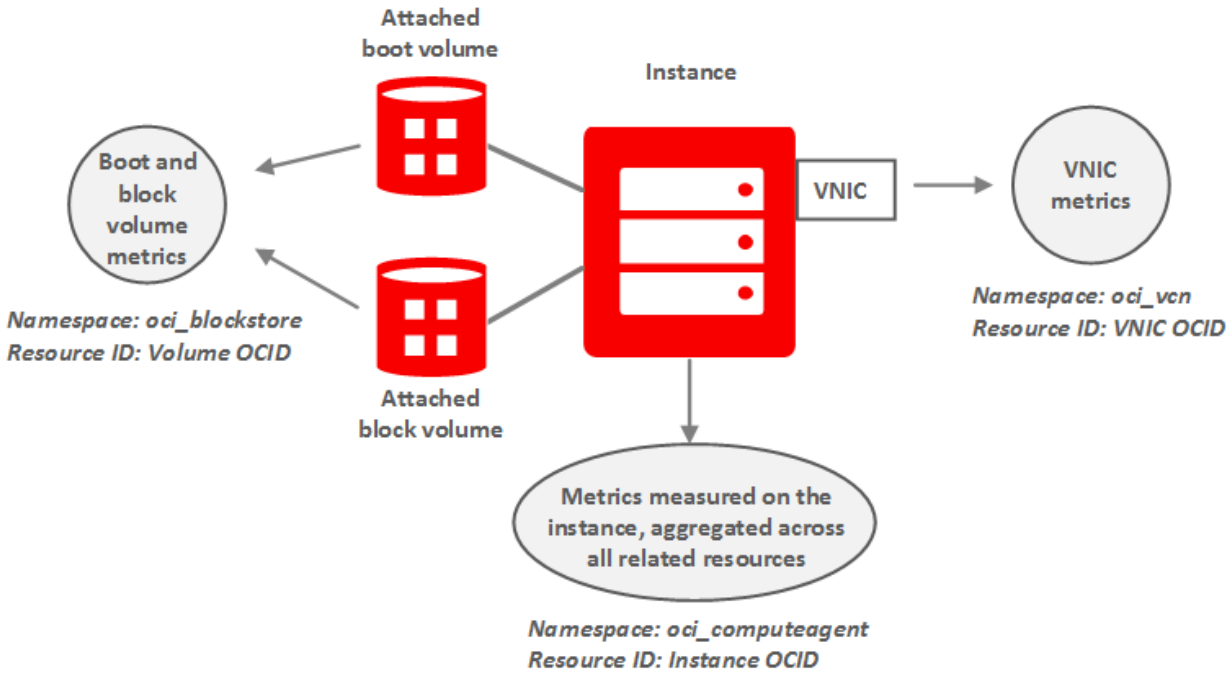
To determine instance agent configuration (`isMonitoringDisabled` value), use the GetInstance or ListInstances operation.

To enable monitoring on an existing instance

Use the UpdateInstance API operation and include the following parameter setting.

```
{
  "agentConfig":
  {
    "isMonitoringDisabled":false
  }
}
```

Compute Metrics



You can monitor the health, capacity, and performance of your Compute instances by using metrics, alarms, and notifications.

This topic describes the metrics emitted by the metric namespace `oci_computeagent` (the OracleCloudAgent software on the Compute instances).

Resources: Monitoring-enabled Compute instances.

Overview of Metrics for an Instance and Related Resources

This section gives an overall picture of the different types of metrics available for an instance and its storage and network devices. See the following diagram and table for a summary.

Metric Namespace	Resource ID	Where Measured	Available Metrics
`oci_computeagent`	Instance OCID	On the instance. The metrics in this namespace are aggregated across all the related resources on the instance. For example, `DiskBytesRead` is aggregated across all the instance's attached storage volumes, and `NetworkBytesIn` is aggregated across all the instance's attached VNICs.	See Available Metrics: oci_computeagent.
`oci_blockstore`	Boot or block volume OCID	By the Block Volume service. The metrics are for an individual volume (either boot volume or block volume).	See Block Volume Metrics
`oci_vcn`	VNIC OCID	By the Networking service. The metrics are for an individual VNIC.	See Networking Metrics

Prerequisites

- IAM policies: To monitor resources, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. The policy must give you access to the monitoring services as well as the resources being monitored. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in. For more information on user authorizations for monitoring, see the Authentication and Authorization section for the related service: Monitoring or Notifications.

- Metrics exist in Monitoring: The resources that you want to monitor must emit metrics to the Monitoring service.
- Compute instances: To emit metrics, Compute instances must be monitoring-enabled. OracleCloudAgent software installation may also be required. For more information, see Enabling Monitoring for Compute Instances.

Available Metrics: oci_computeagent

The Compute service metrics help you measure activity level and throughput of Compute instances. The metrics listed in the following table are available for any monitoring-enabled Compute instance. You must enable monitoring on the instances to get these metrics.

The metrics in this namespace are aggregated across all the related resources on the instance. For example, `DiskBytesRead` is aggregated across all the instance's attached storage volumes, and `NetworkBytesIn` is aggregated across all the instance's attached VNICs.

You also can use the Monitoring service to create custom queries.

Each metric includes the following dimensions:

AVAILABILITYDOMAIN

The availability domain where the instance resides.

FAULTDOMAIN

The fault domain where the instance resides.

IMAGEID

The OCID of the image for the instance.

INSTANCEPOOLID

The instance pool that the instance belongs to.

REGION

The region where the instance resides.

RESOURCEDISPLAYNAME

The friendly name of the instance.

RESOURCEID

The OCID of the instance.

SHAPE

The shape of the instance.

Metric	Metric Display Name	Unit	Description	Dimensions
CpuUtilization	**CPU Utilization**	percent	Activity level from CPU. Expressed as a percentage of total time.	availabilityDomain faultDomain imageId instancePoolId region resourceDisplayName resourceId shape
DiskBytesRead[1, 3]	**Disk Read Bytes**	bytes	Read throughput. Expressed as bytes read per interval.	
DiskBytesWritten[1, 3]	**Disk Write Bytes**	bytes	Write throughput. Expressed as bytes written per interval.	
DiskIopsRead[1, 3]	**Disk Read I/O**	operations	Activity level from I/O reads. Expressed as reads per interval.	

Metric	Metric Display Name	Unit	Description	Dimensions
DiskIopsWritten[1, 3]	**Disk Write I/O**	operations	Activity level from I/O writes. Expressed as writes per interval.	
MemoryUtilization[1]	**Memory Utilization**	percent	Space currently in use. Measured by pages. Expressed as a percentage of used pages.	

Metric	Metric Display Name	Unit	Description	Dimensions
NetworksBytesIn[1, 2]	**Network Receive Bytes**	bytes	Network receipt throughput. Expressed as bytes received.	
NetworksBytesOut[1, 2]	**Network Transmit Bytes**	bytes	Network transmission throughput. Expressed as bytes transmitted.	

[1]This metric is a cumulative counter that shows monotonically increasing behavior for each session of the OracleCloudAgent software, resetting when the operating system is restarted.

[2]The Networking service provides additional metrics (in the `oci_vcn` metric namespace) for each VNIC on the instance. For more information, see Networking Metrics.

[3]The Block Volume service provides additional metrics (in the `oci_blockstore` metric namespace) for each volume attached to the instance. For more information, see Block Volume Metrics.

Using the Console

To view default metric charts for a single Compute instance

1. Open the navigation menu. Under **Core Infrastructure**, go to **Compute** and click **Instances**.
2. In the list of instances, find the instance you want to view metric charts for, and then click the instance name to display the instance details.
3. Under **Resources**, click **Metrics**.
   The Metrics page displays a chart for each metric that is emitted by the metric namespace for Compute instances. For more information about the emitted metrics, see Compute Metrics.

Not seeing any metric charts for the instance?

If you don't see any metric charts, your Compute instance might not be emitting metrics. See the following possible causes and resolutions.

Possible cause	How to check	Resolution
Monitoring is disabled on the instance.	Review the instance configuration.	Enable monitoring.
No OracleCloudAgent software exists on the instance (occurs with older images).	Connect to the instance and look for the software.	Install the software.

Possible cause	How to check	Resolution
The instance cannot access theMonitoring service because its VCN does not use the Internet.	Review the instance's IP address. If it's not public, then a service gateway is needed.	Set up a service gateway.
The instance does not use a supported image.	Review Supported Images.	Create an instance with a supported image.
New instance in a new compartment: The IAM policies required for the instance to publish metrics to Monitoring are not yet initialized. More information: IAM policies are automatically created for new instances and are immediately available, unless the instances are in a new compartment. For a new instance in a new compartment, the policies can take up to 20 minutes to initialize, which delays the emission of metrics.	(not applicable)	Check back after 10 or 20 minutes.

For more information about monitoring metrics and using alarms, see Monitoring Overview. For information about notifications for alarms, see Notifications Overview.

To view default metric charts for resources related to a Compute instance

- **For an attached block volume:** While viewing the instance's details, click **Attached Block Volumes**, and then click the volume you're interested in. Click **Metrics** to see the volume's charts. For more information about the emitted metrics, see Block Volume Metrics.
- **For the attached boot volume:** While viewing the instance's details, click **Boot Volume**, and then click the volume you're interested in. Click **Metrics** to see the volume's charts. For more information about the emitted metrics, see Block Volume Metrics.
- **For an attached VNIC:** While viewing the instance's details, click **Attached VNICs**, and then click the VNIC you're interested in. Click **Metrics** to see the charts for the VNIC. For more information about the emitted metrics, see Networking Metrics.

To view default metric charts for multiple Compute instances

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Monitoring** and click **Service Metrics**.
2. For **Metric Namespace**, select **oci_computeagent**.
   The **Service Metrics** page dynamically updates the page to show charts for each metric that is emitted by the selected metric namespace. For more information about the emitted metrics, see Compute Metrics.

For more information about monitoring metrics and using alarms, see Monitoring Overview. For information about notifications for alarms, see Notifications Overview.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following APIs for monitoring:

- Monitoring API for metrics and alarms
- Notifications API for notifications (used with alarms)

Compute Performance

The content in the sections below apply to **Category 7** and **Section 3.a** of the Oracle PaaS and IaaS Public Cloud Services Pillar documentation.

Oracle Cloud Infrastructure provides a variety of instance configurations in both bare metal and virtual machine (VM) shapes. Each shape varies on multiple dimensions including memory, CPU cores, network bandwidth, and the option of local NVMe SSD storage found in DenseIO shapes.

Oracle Cloud Infrastructure provides a service-level agreement (SLA) for NVMe performance. Measuring performance is complex and open to variability.

A NVMe drive also has non-uniform drive performance over the period of drive usage. A NVMe drive performs differently when tested brand new compared to when tested in a steady-state after some duration of usage. New drives have not incurred many write/erase cycles and the inline garbage collection has not had a significant impact on IOPS performance. To achieve the goal of reproducibility and reduced variability, our testing focuses on the steady-state duration of the NVMe drive's operation.

Testing Methodology

Warning

Before running any tests, protect your data by making a backup of your data and operating system environment to prevent any data loss. The tests described in this document will overwrite the data on the disk, and cause data corruption.

Summary: To capture the IOPS measure, first provision a shape such as the new BM.DenseIO2.52, and then use the Gartner Cloud Harmony test suite to run tests on an instance running the latest supported Oracle Linux image for each NVMe drive target.

Instructions:

1. Launch an instance based on the latest supported Oracle Linux image and select a shape such as the new BM.DenseIO2.52. For launch instructions, see Creating an Instance.
2. Run the Gartner Cloud Harmony test suite tests on the instance for each NVMe drive target. The following is an example of a command that will work for all shapes and drives on the shape:

```
sudo ./run.sh `ls /dev/nvme[0-9]n1 | sed -e 's/\//\--target=\//'`
--nopurge -noprecondition --fio_direct=1 --fio_size=10g --test=iops
--skip_blocksize=512b --skip_blocksize=8k --skip_blocksize=16k
--skip_blocksize=32k --skip_blocksize=64k --skip_blocksize=128k
--skip_blocksize=1m
```

The SLA for NVMe drive performance is measured against 4k block sizes with 100% random write workload on DenseIO shapes where the drive is in a steady-state of operation.

Performance Benchmarks

The following table lists the minimum IOPS for the specified shape to meet the SLA, given the testing methodology with 4k block sizes for 100% random write tests using the tests described in the previous section.

Shape	Minimum Supported IOPS
VM.DenseIO1.4	200k
VM.DenseIO1.8	250k
VM.DenseIO1.16	400k
BM.DenseIO1.36	2.5MM

Shape	Minimum Supported IOPS
VM.DenseIO2.8	250k
VM.DenseIO2.16	400k
VM.DenseIO2.24	800k
BM.DenseIO2.52	3.0MM

While the NVMe drives are capable of higher IOPS, Oracle Cloud Infrastructure currently guarantee this minimum level of IOPS performance.

Frequently Asked Questions

Q: I suspect a slowdown in my NVMe drive performance. Is there a SLA violation?

A: We test hosts on a regular basis to ensure that are our low-level software updates do not regress performance. In the event you have reproduced the testing methodology and your drive's performance does not meet the terms in the SLA please contact your Oracle sales team.

Q: Why does the testing methodology not represent a diversity of IO workloads such as random reads and writes to reflect real world IO?

A: We focused on reproducibility and we believe the tests provide a significant indicator of overall drive performance.

Q: Will Oracle Cloud Infrastructure change the tests in this document?

A: We will make changes to provide greater customer value through better guarantees and improved reproducibility.

Compute Health Monitoring for Bare Metal Instances

Compute health monitoring for bare metal instances is a feature that provides notifications about hardware issues with your bare metal instances. With the health monitoring feature, you can now easily monitor the health of your bare metal instances' hardware, including their components such as DIMM, CPU, motherboard and NVMe drives. You can use the notifications to identify problems enabling you to proactively redeploy your instances to improve availability.

Health monitoring notifications are sent in emails to the tenant administrator within one business day of the error occurring. This warning allows you to take action before any potential hardware failure and redeploy your instances to healthy hardware to minimize the impact on your applications.

Guidance on Compute Health Monitoring Error Messages

This section contains information about the most common health monitoring error messages and provides troubleshooting suggestions for you to try for your bare metal instance.

Click the error message that matches the information in your notification email to expand the troubleshooting section.

1: A fault in the PCI subsystem has been detected

Details: This error indicates that one or more of the PCI devices in your instance have either failed or are not operating at peak performance.

Troubleshooting steps:

- If you cannot connect to the instance over the network, (see Connecting to an Instance), the NIC may have failed. Use the Console or CLI to stop the instance and then start the instance, see Stopping and Starting an Instance.
  If you're still unable to connect to the instance over the network, you may still be able to connect to it using a console connection. Follow the steps in Connecting to the Serial Console or Connecting to the VNC Console to establish a console connection and then

reboot the instance. If the instance remains inaccessible you will need to replace it using the steps in Moving a Compute Instance.

- An NVMe device may have failed.

  On Linux-based systems, run the command `sudo lsblk` to get a list of the attached NVMe devices.

  On Windows-based systems, open Disk Manager. Check the count of NVMe devices against the expected number of devices in Compute Shapes.

  If you determine that an NVMe device is missing from the list of devices for your instance, we recommend replacing the instance using the steps in Moving a Compute Instance.

2:A fault in the memory subsystem was detected

Details: This error indicates that one or more non-critical errors has been detected on a DIMM in your instance. The instance may have unexpectedly rebooted in the last 72 hours.

Troubleshooting steps:

- If the instance has unexpectedly rebooted in the last 72 hours one or more DIMMs may have been disabled.
  - On Linux-based systems, run the command `awk '$3=="kB" {$2=$2/1024**2;$3="GB";} 1' /proc/meminfo | column -t | grep MemTotal` to check for the total amount of memory in the instance.
  - On Windows-based systems, open Resource Monitor to check the memory for the instance.

  If the total memory in the instance is lower than expected, then one or more DIMMs have failed. If this is impacting your application we recommend replacing the instance using the steps in Moving a Compute Instance.
- If the instance has not unexpectedly rebooted it is at increased risk of doing so. During the next reboot one or more DIMMs may be disabled. We recommend replacing the instance using the steps in Moving a Compute Instance.

3: A fault in the memory subsystem was detected during instance launch or a recent reboot

Details: This error indicates that one or more failed DIMMs were detected in your instance while the instance was being launched or rebooted. Any failed DIMMs have been disabled.

Troubleshooting steps: The total amount of memory in the instance will be lower than expected. If this is impacting your application we recommend replacing the instance using the steps in Moving a Compute Instance.

To check for the amount of memory in the instance:

- On Linux-based systems, run the command `awk '$3=="kB" {$2=$2/1024**2;$3="GB";} 1' /proc/meminfo | column -t | grep MemTotal` to check for the total amount of memory in the instance.
- On Windows-based systems, open Resource Monitor to check the memory for the instance.

The expected values are documented in Compute Shapes.

4: A fault has been detected in one or more CPUs

Details: This error indicates that a processor or one or more cores have failed in your instance. Your instance may be inaccessible or there may be fewer available cores than expected.

Troubleshooting steps:

- If the instance is inaccessible you will need to replace it using the steps in Moving a Compute Instance.
- If your instance is available check for the expected number of cores.
    - On Linux-based systems, run the command `nproc --all` to check for the number of cores.
    - On Windows-based systems, open Resource Monitor to to check for the number of cores.

Compare the core count to the expected values documented in Compute Shapes. If the number of cores is less than expected and this reduction is impacting your application we recommend replacing the instance using the steps in Moving a Compute Instance.

5: A fault in the instance management controller has been detected

Details: This error indicates that a device used to manage your instance may have failed. You may not be able to use the Console, CLI, SDKs , or REST APIs to stop, start, or reboot your instance. This functionality will still be available from within the instance using the standard operating system commands. You also may not be able to create a console connection to your instance. You will still be able to terminate your instance.

Troubleshooting steps: If this loss of control is impacting your application we recommend replacing the instance using the steps in Moving a Compute Instance.

CHAPTER 7 Container Engine for Kubernetes

This chapter explains how to define and create Kubernetes clusters to enable the deployment, scaling, and management of containerized applications.

Overview of Container Engine for Kubernetes

Oracle Cloud Infrastructure Container Engine for Kubernetes is a fully-managed, scalable, and highly available service that you can use to deploy your containerized applications to the cloud. Use Container Engine for Kubernetes (sometimes abbreviated to just OKE) when your development team wants to reliably build, deploy, and manage cloud-native applications. You specify the compute resources that your applications require, and Container Engine for Kubernetes provisions them on Oracle Cloud Infrastructure in an existing OCI tenancy.

Container Engine for Kubernetes uses Kubernetes - the open-source system for automating deployment, scaling, and management of containerized applications across clusters of hosts. Kubernetes groups the containers that make up an application into logical units (called pods) for easy management and discovery. Container Engine for Kubernetes uses versions of Kubernetes certified as conformant by the Cloud Native Computing Foundation (CNCF).

You can access Container Engine for Kubernetes to define and create Kubernetes clusters using the Console and the REST API. You can access the clusters you create using the Kubernetes command line (kubectl), the Kubernetes Dashboard, and the Kubernetes API.

Container Engine for Kubernetes is integrated with Oracle Cloud Infrastructure Identity and Access Management (IAM), which provides easy authentication with native Oracle Cloud Infrastructure identity functionality.

For an introductory tutorial, see Creating a Cluster with Oracle Cloud Infrastructure Container Engine for Kubernetes.

Ways to Access Oracle Cloud Infrastructure

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see Software Development Kits and Command Line Interface.

To access the Console, you must use a supported browser. Oracle Cloud Infrastructure supports the latest desktop versions of Google Chrome, Microsoft Edge, Internet Explorer 11, Safari, Firefox, and Firefox ESR. Note that private browsing mode is not supported for Firefox, Internet Explorer, or Edge. Mobile browsers are not supported.

For general information about using the API, see REST APIs.

Resource Identifiers

Most types of Oracle Cloud Infrastructure resources have a unique, Oracle-assigned identifier called an Oracle Cloud ID (OCID). For information about the OCID format and other ways to identify your resources, see Resource Identifiers.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Note that to perform certain operations on clusters created by Container Engine for Kubernetes, you might require additional permissions granted via a Kubernetes RBAC role or clusterrole. See About Access Control and Container Engine for Kubernetes.

Container Engine for Kubernetes Capabilities and Limits

In each region that is enabled for your tenancy, you can create three clusters (Monthly Universal Credits) or one cluster (Pay-as-You-Go or Promo) by default. Each cluster you create can have a maximum of 1000 nodes. See Service Limits.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies.

For more details about policies for Container Engine for Kubernetes, see:

- Policy Configuration for Cluster Creation and Deployment
- Details for Container Engine for Kubernetes

Preparing for Container Engine for Kubernetes

Before you can use Container Engine for Kubernetes to create a Kubernetes cluster:

- You must have access to an Oracle Cloud Infrastructure tenancy. The tenancy must be subscribed to one or more of the regions in which Container Engine for Kubernetes is available (see Availability by Region Name and Region Code).

- Your tenancy must have sufficient quota on different types of resource (see Service Limits). More specifically:
    - Compute instance quota: To create a Kubernetes cluster, at least one compute instance (node) must be available in the tenancy. For example, to create a highly available cluster spanning three availability domains, three compute instances must be available (one in each availability domain in a region).
    - Block volume quota: If you intend to create Kubernetes persistent volumes, sufficient block volume quota must be available in each availability domain to meet the persistent volume claim. Persistent volume claims must request a minimum of 50 gigabytes. See Creating a Persistent Volume Claim.
    - Load balancer quota: If you intend to create a load balancer to distribute traffic between the nodes running a service in a Kubernetes cluster, sufficient load balancer quota must be available in the region. See Creating Load Balancers to Distribute Traffic Between Cluster Nodes.
- Within your tenancy, there must already be a compartment to contain the necessary network resources (such as a VCN, subnets, internet gateway, route table, security lists). If such a compartment does not exist already, you will have to create it. Note that the network resources can reside in the root compartment. However, if you expect multiple teams to create clusters, best practice is to create a separate compartment for each team.
- Within the compartment, network resources (such as a VCN, subnets, internet gateway, route table, security lists) must be appropriately configured in each region in which you want to create and deploy clusters. For example, to create a highly available cluster spanning three availability domains, the VCN must include three subnets in different availability domains for node pools, and optionally (but usually) one or two further subnets for load balancers. When creating a new cluster, you can have Container Engine for Kubernetes automatically create and configure new network resources for the new cluster, or you can specify existing network resources. If you specify existing network resources, you or somebody else must have already configured those resources appropriately. See Network Resource Configuration for Cluster Creation and Deployment.

- Within the root compartment of your tenancy, a policy statement (`Allow service OKE to manage all-resources in tenancy`) must be defined to give Container Engine for Kubernetes access to resources in the tenancy. See Create Policy for Container Engine for Kubernetes (Required)
- To create and/or manage clusters, you must belong to one of the following:
    - The tenancy's Administrators group
    - A group to which a policy grants the appropriate Container Engine for Kubernetes permissions. If you are creating or modifying clusters using the Console, or want Container Engine for Kubernetes to automatically create and configure new network resources for a new cluster, policies must also grant the group the following permissions:
        - VCN_READ and VCN_CREATE
        - SUBNET_READ and SUBNET_CREATE
        - COMPARTMENT_INSPECT
        - INTERNET_GATEWAY_CREATE
        - NAT_GATEWAY_CREATE
        - ROUTE_TABLE_UPDATE
        - SECURITY_LIST_CREATE

      See Create One or More Policies for Groups (Optional).
- To perform operations on a cluster:
    - You must have installed and configured the Kubernetes command line tool kubectl (see the kubectl documentation).
    - You must have downloaded the cluster's kubeconfig configuration file (see Downloading a kubeconfig File to Enable Cluster Access).
    - You must have appropriate permissions to access the cluster (see About Access Control and Container Engine for Kubernetes).

Availability by Region Name and Region Code

Container Engine for Kubernetes is available in the following regions. Note that you have to use the region code in some commands. In some cases, you might have to use shortened versions of availability domain names.

Region Name	Region Code	Shortened Availability Domain Names
Ashburn	iad	• US-ASHBURN-AD-1 • US-ASHBURN-AD-2 • US-ASHBURN-AD-3
Frankfurt	fra	• EU-FRANKFURT-1-AD-1 • EU-FRANKFURT-1-AD-2 • EU-FRANKFURT-1-AD-3
London	lhr	• UK-LONDON-1-AD-1 • UK-LONDON-1-AD-2 • UK-LONDON-1-AD-3
Phoenix	phx	• PHX-AD-1 • PHX-AD-2 • PHX-AD-3
Seoul	icn	• AP-SEOUL-1-AD-1
Tokyo	nrt	• AP-TOKYO-1-AD-1
Toronto	yyz	• CA-TORONTO-1-AD-1

Network Resource Configuration for Cluster Creation and Deployment

Before you can use Container Engine for Kubernetes to create and deploy clusters in the regions in a tenancy:

- The tenancy's root compartment must include a policy to allow Container Engine for Kubernetes to perform operations in the tenancy. See Create Policy for Container Engine for Kubernetes (Required).
- Within the tenancy, there must already be a compartment to contain the necessary network resources (such as a VCN, subnets, internet gateway, route table, security lists). If such a compartment does not exist already, you will have to create it. Note that the network resources can reside in the root compartment. However, if you expect multiple teams to create clusters, best practice is to create a separate compartment for each team.
- Within the compartment, network resources (such as a VCN, subnets, internet gateway, route table, security lists) must be appropriately configured in each region in which you want to create and deploy clusters. When creating a new cluster, you can have Container Engine for Kubernetes automatically create and configure new network resources for a new 'quick cluster'. Alternatively, you can explicitly specify the existing network resources to use for a 'custom cluster'. If you specify existing network resources, you or somebody else must have already configured those resources appropriately, as described in this topic.

This topic describes the necessary configuration for each network resource. To see details of a typical configuration, see Example Network Resource Configurations.

For an introductory tutorial, see Creating a Cluster with Oracle Cloud Infrastructure Container Engine for Kubernetes.

Root Compartment Configuration

You have to define a policy for the tenancy's root compartment to enable Container Engine for Kubernetes to perform operations on the tenancy. See Create Policy for Container Engine for Kubernetes (Required).

VCN Configuration

The VCN in which you want to create and deploy clusters must be configured as follows:

- The VCN must have a CIDR block defined that is large enough for the number of subnets you specify for the clusters you create. For example, to create a highly available cluster will typically require five subnets to support the necessary number of hosts and load balancers. However, you can create clusters with fewer subnets. A /16 CIDR block would be large enough for almost all use cases (10.0.0.0/16 for example). The CIDR block you specify for the VCN must not overlap with the CIDR block you specify for pods and for the Kubernetes services (see CIDR Blocks and Container Engine for Kubernetes).
- The VCN must have an internet gateway defined. See Internet Gateway Configuration.
- If you intend to deploy worker nodes in private subnets, the VCN must have a NAT gateway defined. See NAT Gateway Configuration.
- The VCN must have a route table defined that has a route rule specifying the internet gateway as the target for the destination CIDR block. If you intend to deploy worker nodes in private subnets, the route table must also have a route rule specifying the NAT gateway as the target for the destination CIDR block. See Route Table Configuration.
- The VCN must have an appropriate number of subnets defined. For example, to create a typical highly available cluster will require three subnets in different availability domains in which to deploy worker nodes, and two subnets to host load balancers. However, you can create clusters with fewer worker nodes, and fewer or no load balancers, and therefore require fewer subnets. See Subnet Configuration.
- The VCN must have security lists defined for worker node subnets and load balancer subnets (if specified). See Security List Configuration.

In addition, Oracle recommends DNS Resolution is selected for the VCN.

See VCNs and Subnets and Example Network Resource Configurations.

Internet Gateway Configuration

The VCN in which you want to create and deploy clusters must have an internet gateway. The internet gateway must be specified as the target for the destination CIDR block 0.0.0.0/0 in a

route rule in a route table.

See VCNs and Subnets and Example Network Resource Configurations.

NAT Gateway Configuration

If you intend to deploy worker nodes in private subnets, the VCN must have a NAT gateway (in addition to an internet gateway) to enable the worker nodes to initiate connections to the internet. The NAT gateway must be specified as the target for the destination CIDR block 0.0.0.0/0 in a route rule in a separate route table.

See NAT Gateway and Example Network Resource Configurations.

Route Table Configuration

The VCN in which you want to create and deploy clusters must have a route table. The route table must have a route rule that specifies an internet gateway as the target for the destination CIDR block 0.0.0.0/0.

If you intend to deploy worker nodes in private subnets, a separate route table must have a route rule that specifies a NAT gateway as the target for the destination CIDR block 0.0.0.0/0 to enable the worker nodes to initiate connections to the internet. This route table is in addition to the route table specifying an internet gateway as a target.

See Internet Gateway and Example Network Resource Configurations.

DHCP Options Configuration

The VCN in which you want to create and deploy clusters must have DHCP Options configured. The default value for **DNS Type** of Internet and VCN Resolver is acceptable.

See DHCP Options and Example Network Resource Configurations.

Security List Configuration

The VCN in which you want to create and deploy clusters must have security lists defined for worker node subnets and load balancer subnets (if specified). The security lists for worker

node subnets and load balancer subnets must be different. The security list for load balancer subnets must be unique and for their exclusive use.

Worker nodes are created with public or private IP addresses, according to whether you specify public or private subnets when defining the node pools in a cluster. In both cases, worker nodes must be able to make outbound connections to the internet. Container Engine for Kubernetes must also be able to access worker nodes.

See Security Lists and Example Network Resource Configurations.

Public Worker Node Subnet Security List configuration

When configuring a security list for public worker node subnets, the security list must have:

- stateless ingress and egress rules that allow all traffic between the different worker node subnets
- stateless ingress and egress rules that allow all traffic between worker node subnets and load balancer subnets (if specified)
- an egress rule that allows all outbound traffic to the internet
- ingress rules to allow Container Engine for Kubernetes to access worker nodes on port 22 from the following source CIDR blocks:
    - 130.35.0.0/16
    - 134.70.0.0/17
    - 138.1.0.0/16
    - 140.91.0.0/17
    - 147.154.0.0/16
    - 192.29.0.0/16

Optionally, you can include ingress rules for public worker node subnets to:

- explicitly allow SSH access to worker nodes on port 22 (see Connecting to Worker Nodes in Public Subnets Using SSH)
- allow inbound traffic to the worker nodes on the default NodePort range of 30000 to 32767 (see the Kubernetes documentation)

Private Worker Node Subnet Security List configuration

When configuring a security list for private worker node subnets, the security list must have:

- stateless ingress and egress rules that allow all traffic between the different worker node subnets
- stateless ingress and egress rules that allow all traffic between worker node subnets and load balancer subnets
- an egress rule that allows all outbound traffic to the internet

Optionally, you can include ingress rules for private worker node subnets to:

- explicitly allow SSH access to worker nodes on port 22 from within the VCN CIDR block (see Connecting to Worker Nodes in Private Subnets Using SSH)
- allow inbound traffic to the worker nodes on the default NodePort range of 30000 to 32767 from within the VCN CIDR block (see the Kubernetes documentation)

Subnet Configuration

The characteristics of the cluster you want to create, and the number of availability domains in the region in which you want to deploy the cluster, will determine the number of subnets to configure. For example, to create a typical highly available cluster will require three subnets in different availability domains in which to deploy worker nodes, and two subnets to host load balancers.

Note

Note that Container Engine for Kubernetes does not yet support regional subnets, so you cannot currently deploy worker nodes or host load balancers in regional subnets.

The VCN in which you want to create and deploy clusters must have at least one subnet defined in which to deploy worker nodes. Worker node subnets can be either public, or private

for additional security (as specified by the **Subnet access** property). The number of worker node subnets to create depends on the region in which you are creating the cluster:

- If you are creating a cluster in a region with multiple availability domains, you can define multiple worker node subnets. Each worker node subnet must be in a different availability domain.
- If you are creating a cluster in a region with a single availability domain, you can only define one worker node subnet.

You have the option to define and use load balancers in clusters you create. If you want to define and use load balancers, the VCN in which you want to create and deploy clusters must have at least one subnet defined to host the load balancers. Load balancer subnets can be public or private (as specified by the **Subnet access** property) and must each be in a separate availability domain. However, load balancers are optional, so you might not define load balancer subnets at all. The number of load balancer subnets to define depends on the region in which you are creating the cluster:

- If you are creating a cluster in a region with three availability domains, you can define zero or two load balancer subnets. If you define two load balancer subnets, the two load balancer subnets must be in different availability domains.
- If you are creating a cluster in a region with a single availability domain, you can define zero or one load balancer subnet.

In addition, all subnets must have the following properties set as shown:

- **Route Table:** The name of the route table that has a route rule specifying an internet gateway (for public worker node subnets) or NAT gateway (for private worker node subnets) as the target for the destination CIDR block 0.0.0.0/0
- **DHCP options:** Default

The CIDR blocks you specify for worker node and load balancer subnets must not overlap with CIDR blocks you specify for pods running in the cluster (see CIDR Blocks and Container Engine for Kubernetes).

Worker node subnets must have different security lists to load balancer subnets.

See VCNs and Subnets and Example Network Resource Configurations.

Example Network Resource Configurations

Before you can use Container Engine for Kubernetes to create and deploy clusters in the regions in a tenancy:

- The tenancy's root compartment must include a policy to allow Container Engine for Kubernetes to perform operations in the tenancy. See Create Policy for Container Engine for Kubernetes (Required).
- Within the tenancy, there must already be a compartment to contain the necessary network resources (such as a VCN, subnets, internet gateway, route table, security lists). If such a compartment does not exist already, you will have to create it. Note that the network resources can reside in the root compartment. However, if you expect multiple teams to create clusters, best practice is to create a separate compartment for each team.
- Within the compartment, network resources (such as a VCN, subnets, internet gateway, route table, security lists) must be appropriately configured in each region in which you want to create and deploy clusters. When creating a new cluster, you can have Container Engine for Kubernetes automatically create and configure new network resources for a new 'quick cluster'. Alternatively, you can explicitly specify the existing network resources to use for a 'custom cluster'. If you specify existing network resources, you or somebody else must have already configured those resources appropriately. See Network Resource Configuration for Cluster Creation and Deployment.

This topic gives examples of how you might configure network resources for highly available cluster creation and deployment in a region with three availability domains:

- for public clusters, where you want worker nodes hosted in public subnets that can be accessed directly from the internet (see Example 1: Example Network Resource Configuration for a Highly Available Public Cluster)
- for private clusters, where you want worker nodes hosted in private subnets that can only be accessed from within the VCN (see Example 2: Example Network Resource Configuration for a Highly Available Private Cluster)

For an introductory tutorial, see Creating a Cluster with Oracle Cloud Infrastructure Container Engine for Kubernetes.

Example 1: Example Network Resource Configuration for a Highly Available Public Cluster

This example assumes you want worker nodes hosted in three public subnets that can be accessed directly from the internet.

EXAMPLE NETWORK RESOURCE CONFIGURATION

Resource	Example
VCN	Created manually, and defined as follows: • **Name:** acme-dev-vcn • **CIDR Block:** 10.0.0.0/16 • **DNS Resolution:** Selected
Internet Gateway	Created manually, and defined as follows: • **Name:** gateway-0
Route Table	Created manually, and defined as follows: • **Name:** routetable-0 A route rule defined as follows: • **Destination CIDR block:** 0.0.0.0/0 • **Target Type:** Internet Gateway • **Target Internet Gateway:** gateway-0
DHCP Options	Created automatically and defined as follows: • **DNS Type** set to Internet and VCN Resolver

Resource	Example
Security Lists	Two created (in addition to the default security list) manually, named, and defined as follows: • **Security List Name:** workers • **Security List Name:** loadbalancers For details of the ingress rules and egress rules defined for the workers security list and the loadbalancers security list, see Example Security List Configurations for a Highly Available Public Cluster.

Resource	Example
Subnets	Three worker subnets created manually, named, and defined as follows: • **Name:** workers-1 with the following properties: ◦ **Availability Domain:** AD1 ◦ **CIDR Block:** 10.0.10.0/24 ◦ **Route Table:** routetable-0 ◦ **Subnet access:** Public ◦ **DNS Resolution:** Selected ◦ **DHCP Options:** Default ◦ **Security List:** workers • **Name:** workers-2 with the following properties: ◦ **Availability Domain:** AD2 ◦ **CIDR Block:** 10.0.11.0/24 ◦ **Route Table:** routetable-0 ◦ **Subnet access:** Public ◦ **DNS Resolution:** Selected ◦ **DHCP Options:** Default ◦ **Security List:** workers • **Name:** workers-3 with the following properties: ◦ **Availability Domain:** AD3 ◦ **CIDR Block:** 10.0.12.0/24 ◦ **Route Table:** routetable-0 ◦ **Subnet access:** Public ◦ **DNS Resolution:** Selected ◦ **DHCP Options:** Default

Resource	Example
	◦ **Security List:** workers Two load balancer subnets created, named, and defined as follows: • **Name:** loadbalancers-1 with the following properties: ◦ **Availability Domain:** AD1 ◦ **CIDR Block:** 10.0.20.0/24 ◦ **Route Table:** routetable-0 ◦ **Subnet access:** Public ◦ **DNS Resolution:** Selected ◦ **DHCP Options:** Default ◦ **Security List:** loadbalancers • **Name:** loadbalancers-2 with the following properties: ◦ **Availability Domain:** AD2 ◦ **CIDR Block:** 10.0.21.0/24 ◦ **Route Table:** routetable-0 ◦ **Subnet access:** Public ◦ **DNS Resolution:** Selected ◦ **DHCP Options:** Default ◦ **Security List:** loadbalancers

EXAMPLE SECURITY LIST CONFIGURATIONS FOR A HIGHLY AVAILABLE PUBLIC CLUSTER

In the example VCN, two security lists have been created (in addition to the default security list) to control access to and from the public worker node subnets and load balancer subnets. The two security lists are named 'workers' and 'loadbalancers' respectively.

The workers security list has the following ingress and egress rules for public worker node subnets:

Example Ingress Rules in a Security List for a Public Worker Node Subnet:

#	Type	Source CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
1	Stateless	10.0.10.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.
2	Stateless	10.0.11.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.
3	Stateless	10.0.12.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.

#	Type	Source CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
4	Stateful	0.0.0.0/0	ICMP	n/a	n/a	3, 4	**Allows:** ICMP traffic for: 3, 4 Destination Unreachable: Fragmentation Needed and Don't Fragment was Set **Description:** This rule enables worker nodes to receive Path MTU Discovery fragmentation messages.
5	Stateful	130.35.0.0/16	TCP	All	22	n/a	**Allows:** TCP traffic for ports: 22 SSH Remote Login Protocol **Description:** This rule enables Container Engine for Kubernetes to access worker nodes.

#	Type	Source CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
6	Stateful	134.70.0.0/17	TCP	All	22	n/a	**Allows:** TCP traffic for ports: 22 SSH Remote Login Protocol **Description:** This rule enables Container Engine for Kubernetes to access worker nodes.
7	Stateful	138.1.0.0/16	TCP	All	22	n/a	**Allows:** TCP traffic for ports: 22 SSH Remote Login Protocol **Description:** This rule enables Container Engine for Kubernetes to access worker nodes.

#	Type	Source CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
8	Stateful	140.91.0.0/17	TCP	All	22	n/a	**Allows:** TCP traffic for ports: 22 SSH Remote Login Protocol **Description:** This rule enables Container Engine for Kubernetes to access worker nodes.
9	Stateful	147.154.0.0/16	TCP	All	22	n/a	**Allows:** TCP traffic for ports: 22 SSH Remote Login Protocol **Description:** This rule enables Container Engine for Kubernetes to access worker nodes.

#	Type	Source CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
10	Stateful	192.29.0.0/16	TCP	All	22	n/a	**Allows:** TCP traffic for ports: 22 SSH Remote Login Protocol **Description:** This rule enables Container Engine for Kubernetes to access worker nodes.
11	Stateful	0.0.0.0/0	TCP	All	22	n/a	**Allows:** TCP traffic for ports: 22 SSH Remote Login Protocol **Description:** This *optional* rule enables inbound SSH traffic from the internet on port 22 to access worker nodes.

#	Type	Source CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
12	Stateful	0.0.0.0/0	TCP	All	30000 - 32767	n/a	**Allows:** TCP traffic for ports: 30000 - 32767 **Description:** This *optional* rule enables inbound traffic to the worker nodes on the default NodePort range of 30000-32767 (see the Kubernetes documentation).

Example Egress Rules in a Security List for a Public Worker Node Subnet:

#	Type	Dest. CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
1	Stateless	10.0.10.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.
2	Stateless	10.0.11.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.
3	Stateless	10.0.12.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.
4	Stateful	0.0.0.0/0	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables outbound access to the internet.

The loadbalancers security list has the following ingress and egress rules for load balancer subnets:

Example Ingress Rules in a Security List for a Load Balancer Subnet:

#	Type	Source CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
1	Stateless	0.0.0.0/0	TCP	All	All	n/a	**Allows:** TCP traffic for all ports: all **Description:** This rule enables incoming public traffic to service load balancers.

Example Egress Rules in a Security List for a Load Balancer Subnet:

#	Type	Dest. CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
1	Stateless	0.0.0.0/0	TCP	All	All	n/a	**Allows:** TCP traffic for ports: all **Description:** This rule enables responses from a web application through the service load balancers.

Example 2: Example Network Resource Configuration for a Highly Available Private Cluster

This example assumes you want worker nodes hosted in three private subnets that can only be accessed from within the VCN.

EXAMPLE NETWORK RESOURCE CONFIGURATION

Resource	Example
VCN	Created manually, and defined as follows: • **Name:** acme-dev-vcn • **CIDR Block:** 10.0.0.0/16 • **DNS Resolution:** Selected
Internet Gateway	Created manually, and defined as follows: • **Name:** gateway-0
NAT Gateway	Created manually, and defined as follows: • **Name:** nat-gateway-0
Route Table	Two route tables created manually, named, and defined as follows: • **Name:** routetable-0, with a route rule defined as follows: ◦ **Destination CIDR block:** 0.0.0.0/0 ◦ **Target Type:** Internet Gateway ◦ **Target Internet Gateway:** gateway-0 • **Name:** routetable-1, with a route rule defined as follows: ◦ **Destination CIDR block:** 0.0.0.0/0 ◦ **Target Type:** NAT Gateway ◦ **Target NAT Gateway:** nat-gateway-0

Resource	Example
DHCP Options	Created automatically and defined as follows: • **DNS Type** set to Internet and VCN Resolver
Security Lists	Two created (in addition to the default security list) manually, named, and defined as follows: • **Security List Name:** workers • **Security List Name:** loadbalancers For details of the ingress rules and egress rules defined for these security lists, see Example Security List Configurations for a Highly Available Private Cluster.

Resource	Example
Subnets	Three worker subnets created manually, named, and defined as follows: • **Name:** workers-1 with the following properties: ◦ **Availability Domain:** AD1 ◦ **CIDR Block:** 10.0.10.0/24 ◦ **Route Table:** routetable-1 ◦ **Subnet access:** Private ◦ **DNS Resolution:** Selected ◦ **DHCP Options:** Default ◦ **Security List:** workers • **Name:** workers-2 with the following properties: ◦ **Availability Domain:** AD2 ◦ **CIDR Block:** 10.0.11.0/24 ◦ **Route Table:** routetable-1 ◦ **Subnet access:** Private ◦ **DNS Resolution:** Selected ◦ **DHCP Options:** Default ◦ **Security List:** workers • **Name:** workers-3 with the following properties: ◦ **Availability Domain:** AD3 ◦ **CIDR Block:** 10.0.12.0/24 ◦ **Route Table:** routetable-1 ◦ **Subnet access:** Private ◦ **DNS Resolution:** Selected ◦ **DHCP Options:** Default

Resource	Example
	◦ **Security List:** workers Two load balancer subnets created, named, and defined as follows: • **Name:** loadbalancers-1 with the following properties: ◦ **Availability Domain:** AD1 ◦ **CIDR Block:** 10.0.20.0/24 ◦ **Route Table:** routetable-0 ◦ **Subnet access:** Public ◦ **DNS Resolution:** Selected ◦ **DHCP Options:** Default ◦ **Security List:** loadbalancers • **Name:** loadbalancers-2 with the following properties: ◦ **Availability Domain:** AD2 ◦ **CIDR Block:** 10.0.21.0/24 ◦ **Route Table:** routetable-0 ◦ **Subnet access:** Public ◦ **DNS Resolution:** Selected ◦ **DHCP Options:** Default ◦ **Security List:** loadbalancers

Example Security List Configurations for a Highly Available Private Cluster

In the example VCN, two security lists have been created (in addition to the default security list) to control access to and from the private worker node subnets and load balancer subnets. The two security lists are named 'workers' and 'loadbalancers' respectively.

The workers security list has the following ingress and egress rules for private worker node subnets:

Example Ingress Rules in a Security List for a Private Worker Node Subnet:

#	Type	Source CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
1	Stateless	10.0.10.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.
2	Stateless	10.0.11.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.

#	Type	Source CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
3	Stateless	10.0.12.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.
4	Stateful	10.0.0.0/16	TCP	All	22	n/a	**Allows:** TCP traffic for ports: 22 SSH Remote Login Protocol **Description:** This *optional* rule enables inbound SSH traffic from the VCN on port 22 to access worker nodes.

Example Egress Rules in a Security List for a Private Worker Node Subnet:

#	Type	Dest. CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
1	Stateless	10.0.10.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.
2	Stateless	10.0.11.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.
3	Stateless	10.0.12.0/24	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables intra-VCN traffic.
4	Stateful	0.0.0.0/0	All	n/a	n/a	n/a	**Allows:** All traffic for all ports **Description:** This rule enables outbound access to the internet.

The loadbalancers security list has the following ingress and egress rules for load balancer subnets:

Example Ingress Rules in a Security List for a Load Balancer Subnet:

#	Type	Source CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
1	Stateless	0.0.0.0/0	TCP	All	All	n/a	**Allows:** TCP traffic for all ports: all **Description:** This rule enables incoming public traffic to service load balancers.

Example Egress Rules in a Security List for a Load Balancer Subnet:

#	Type	Dest. CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
1	Stateless	0.0.0.0/0	TCP	All	All	n/a	**Allows:** TCP traffic for ports: all **Description:** This rule enables responses from a web application through the service load balancers.

CIDR Blocks and Container Engine for Kubernetes

When configuring the VCN and the worker node and load balancer subnets for use with Container Engine for Kubernetes, you specify CIDR blocks to indicate the network addresses that can be allocated to the resources. See Network Resource Configuration for Cluster Creation and Deployment.

When creating a cluster with Container Engine for Kubernetes, you specify:

- CIDR blocks for the Kubernetes services
- CIDR blocks that can be allocated to pods running in the cluster (see Creating a Kubernetes Cluster)

Note the following:

- The CIDR block you specify for the VCN must not overlap with the CIDR block you specify for the Kubernetes services.
- The CIDR blocks you specify for pods running in the cluster must not overlap with CIDR blocks you specify for worker node and load balancer subnets.

Policy Configuration for Cluster Creation and Deployment

Before you can use Container Engine for Kubernetes to create and deploy clusters in the regions in a tenancy, the tenancy's root compartment must include a policy to allow Container Engine for Kubernetes to perform operations in the tenancy. See Create Policy for Container Engine for Kubernetes (Required).

When a tenancy is created, an Administrators group is automatically created for the tenancy. Users that are members of the Administrators group can perform any operation on resources in the tenancy. If all the users that will be working with Container Engine for Kubernetes are already members of the Administrators group, there's no need to create additional policies. However, if you want to enable users that are not members of the Administrators group to use Container Engine for Kubernetes, you must write policies to enable the groups to which those users do belong to perform operations on cluster-related resources in the tenancy. See Create One or More Policies for Groups (Optional).

Note that in addition to the above policies managed by IAM, you can also use the Kubernetes RBAC Authorizer to enforce additional fine-grained access control for users on specific clusters via Kubernetes RBAC roles and clusterroles. See About Access Control and Container Engine for Kubernetes.

Create Policy for Container Engine for Kubernetes (Required)

To create and manage clusters in your tenancy, Container Engine for Kubernetes must have access to all resources in the tenancy. To give Container Engine for Kubernetes the necessary access, create a policy for the service as follows:

1. In the Console, open the navigation menu. Under **Governance and Administration**, go to **Identity** and click **Policies**. A list of the policies in the compartment you're viewing is displayed.
2. Select the tenancy's root compartment from the list on the left.
3. Click **Create Policy**.
4. Enter the following:
    - **Name:** A unique name for the policy (for example, `oke-service`). The name must be unique across all policies in your tenancy. You cannot change this later. Avoid entering confidential information.
    - **Description:** A friendly description. You can change this later if you want to. Avoid entering confidential information.
    - **Policy Versioning:** Select **Keep Policy Current** if you'd like the policy to stay current with any future changes to the service's definitions of verbs and resources. Or if you'd prefer to limit access according to the definitions that were current on a specific date, select **Use Version Date** and enter that date in YYYY-MM-DD format. For more information, see Policy Language Version.
    - **Statement:** The following policy statement:

      ```
      Allow service OKE to manage all-resources in tenancy
      ```

    - **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To

apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.

5. Click **Create**.

Create One or More Policies for Groups (Optional)

To enable users that are not members of the Administrators group to use Container Engine for Kubernetes, create policies to enable the groups to which those users do belong to perform operations on cluster-related resources in the tenancy as follows:

1. In the Console, open the navigation menu. Under **Governance and Administration**, go to **Identity** and click **Policies**. A list of the policies in the compartment you're viewing is displayed.
2. Select the tenancy's root compartment from the list on the left.
3. Click **Create Policy**.
4. Enter the following:
   - **Name:** A unique name for the policy (for example, `acme-dev-team-oke-policy`). The name must be unique across all policies in your tenancy. You cannot change this later. Avoid entering confidential information.
   - **Description:** A friendly description. You can change this later if you want to. Avoid entering confidential information.
   - **Policy Versioning:** Select **Keep Policy Current** if you'd like the policy to stay current with any future changes to the service's definitions of verbs and resources. Or if you'd prefer to limit access according to the definitions that were current on a specific date, select **Use Version Date** and enter that date in YYYY-MM-DD format. For more information, see Policy Language Version.

- **Statement:** A suitable policy statement to allow existing groups to perform operations on cluster-related resources in the tenancy. For example:
  - To enable users in the acme-dev-team group to perform any operation on cluster-related resources, enter a policy statement like `Allow group acme-dev-team to manage cluster-family in tenancy`. This 'catch-all' policy effectively makes all users administrators insofar as cluster-related resources are concerned.
  - To enable users in the acme-dev-team group to create or modify clusters using the Console, or to automatically create and configure associated new network resources when creating new 'quick clusters', policies must also grant the group:
    - the VCN_READ and VCN_CREATE permissions. Enter a policy statement like `Allow group acme-dev-team to manage vcns in tenancy`
    - the SUBNET_READ and SUBNET_CREATE permissions. Enter a policy statement like `Allow group acme-dev-team to manage subnets in tenancy`
    - the COMPARTMENT_INSPECT permission. Enter a policy statement like `Allow group acme-dev-team to inspect compartments in tenancy`
    - the INTERNET_GATEWAY_CREATE permission. Enter a policy statement like `Allow group acme-dev-team to manage internet-gateways in tenancy`
    - the NAT_GATEWAY_CREATE permission. Enter a policy statement like `Allow group acme-dev-team to manage nat-gateways in tenancy`
    - the ROUTE_TABLE_UPDATE permission. Enter a policy statement like `Allow group acme-dev-team to manage route-tables in tenancy`

        - the SECURITY_LIST_CREATE permission. Enter a policy statement like `Allow group acme-dev-team to manage security-lists in tenancy`
    - To enable users in the acme-dev-team-cluster-viewers group to simply list the clusters, enter a policy statement like `Allow group acme-dev-team-cluster-viewers to inspect clusters in tenancy`.
    - To enable users in the acme-dev-team-pool-admins group to list, create, update, and delete node pools, enter a policy statement like `Allow group acme-dev-team-pool-admins to use cluster-node-pools in tenancy`.
    - To enable users in the acme-dev-team-auditors group to see details of operations performed on clusters, enter a policy statement like `Allow group acme-dev-team-auditors to read cluster-work-requests in tenancy`.
- **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.

5. Click **Create**.

About Kubernetes Clusters and Nodes

A Kubernetes cluster is a group of nodes. The nodes are the machines running applications. Each node can be a physical machine or a virtual machine. The node's capacity (its number of CPUs and amount of memory) is defined when the node is created. A cluster can be organized into namespaces, to divide the cluster's resources between multiple uses. A cluster comprises:

- one or more master nodes (for high availability, typically there will be a number of master nodes)
- one or more worker nodes (sometimes known as minions)

The master nodes in a cluster run a number of processes:

- kube-apiserver to support API operations via the Kubernetes command line tool (kubectl) and the REST API, and includes admissions controllers required for advanced Kubernetes operations
- kube-controller-manager to manage different Kubernetes components (for example, replication controller, endpoints controller, namespace controller, and serviceaccounts controller)
- kube-scheduler to control where in the cluster to run jobs
- etcd to store the cluster's configuration data

Each worker node runs two Kubernetes processes:

- kubelet to communicate with the master nodes
- kube-proxy to handle networking

Each worker node also runs the Docker runtime.

The Kubernetes processes running on the master nodes are collectively referred to as the Kubernetes Control Plane. Together, the Control Plane processes monitor and record the state of the cluster and distribute requested operations between the nodes in the cluster.

Where an application running on a worker node comprises multiple containers, Kubernetes groups the containers into a single logical unit called a pod for easy management and discovery. The containers in the pod share the same networking namespace and the same storage space, and can be managed as a single object by the Kubernetes Control Plane. A number of pods providing the same functionality can be grouped into a single logical set known as a service.

A Kubernetes manifest file comprises instructions in a yaml or json file that specify how to deploy an application to the node or nodes in a Kubernetes cluster. The instructions include information about the Kubernetes deployment, the Kubernetes service, and other Kubernetes objects to be created on the cluster. The manifest is commonly also referred to as a pod spec, or as a deployment.yaml file (although other filenames are allowed). The parameters to include in a Kubernetes manifest file are described in the Kubernetes documentation.

A node pool is a subset of machines within a cluster that all have the same configuration. Node pools enable you to create pools of machines within a cluster that have different configurations. For example, you might create one pool of nodes in a cluster as virtual machines, and another pool of nodes as bare metal machines. A cluster must have a minimum of one node pool, but a node pool need not contain any worker nodes.

Creating a Kubernetes Cluster

You can use Container Engine for Kubernetes to create new Kubernetes clusters. To create a cluster, you must either belong to the tenancy's Administrators group, or belong to a group to which a policy grants the CLUSTER_MANAGE permission.

You first specify basic details for the new cluster (the cluster name, and the Kubernetes version to install on master nodes). You can then create the cluster in one of two ways:

- Using default settings to create a 'quick cluster' with new network resources as required. This approach is the fastest way to create a new cluster. If you accept all the default values, you can create a new cluster in just a few clicks. New network resources for the cluster are created automatically, along with a node pool and worker nodes. Note that worker nodes in a 'quick cluster' are created in private subnets, so a NAT gateway is also created (in addition to an internet gateway). To create a 'quick cluster', you must belong to a group to which a policy grants the necessary permissions to create the new network resources (see Create One or More Policies for Groups (Optional)).
- Using custom settings to create a 'custom cluster'. This approach gives you the most control over the new cluster. You can explicitly define the new cluster's properties. And you can explicitly specify which existing network resources to use, including the existing public or private subnets in which to create worker nodes. Note that although you will usually define node pools immediately when defining a new 'custom cluster', you don't have to. You can create a 'custom cluster' with no node pools, and add node pools later.

Note

Note that Container Engine for Kubernetes does not yet support regional subnets, so you cannot currently select a regional subnet when specifying a load balancer subnet or a worker node subnet.

Regardless of how you create a cluster, Container Engine for Kubernetes gives names to worker nodes in the following format:

`oke-c<part-of-cluster-OCID>-n<part-of-node-pool-OCID>-s<part-of-subnet-OCID>-<slot>`

where:

- `oke` is the standard prefix for all worker nodes created by Container Engine for Kubernetes
- `c<part-of-cluster-OCID>` is a portion of the cluster's OCID, prefixed with the letter `c`
- `n<part-of-node-pool-OCID>` is a portion of the node pool's OCID, prefixed with the letter `n`
- `s<part-of-subnet-OCID>` is a portion of the subnet's OCID, prefixed with the letter `s`
- `<slot>` is an ordinal number of the node in the subnet (for example, `0`, `1`)

For example, if you specified a cluster is to have two nodes per subnet in a node pool, the two nodes might be named:

- `oke-cywiqripuyg-nsgagklgnst-st2qczvnmba-0`
- `oke-cywiqripuyg-nsgagklgnst-st2qczvnmba-1`

To ensure high availability, Container Engine for Kubernetes creates the Kubernetes Control Plane on multiple Oracle-managed master nodes (distributed across different availability domains in a region where supported).

Using the Console to create a 'Quick Cluster' with Default Settings

To create a 'quick cluster' with default settings and new network resources using Container Engine for Kubernetes:

1. In the Console, open the navigation menu. Under **Solutions, Platform and Edge**, go to **Developer Services** and click **Container Clusters**.
2. Choose a **Compartment** you have permission to work in, and in which you want to create both the new cluster and the associated network resources.
3. On the **Cluster List** page, click **Create Cluster**.
4. Either just accept the default configuration details for the new cluster, or specify alternatives as follows:
    - **Name:** The name of the new cluster. Either accept the default name or enter a name of your choice. Avoid entering confidential information.
    - **Kubernetes Version:** The version of Kubernetes to run on the master nodes and worker nodes of the cluster. Either accept the default version or select a version of your choice. Amongst other things, the Kubernetes version you select determines the default set of admission controllers that are turned on in the created cluster (the set follows the recommendation given in the Kubernetes documentation for that version).
5. Select **Quick Create** to create a new cluster with default settings, along with new network resources for the new cluster.

    The **Create Virtual Cloud Network** panel shows the network resources that will be created for you by default.

    The **Create Node Pool** panel shows the fixed properties of the first node pool in the cluster that will be created for you:
    - the name of the node pool (always pool1)
    - the compartment in which the node pool will be created (always the same as the one in which the new network resources will reside)

- the version of Kubernetes that will run on each worker node in the node pool (always the same as the version specified for the master nodes)
- the image to use on each node in the node pool

The **Create Node Pool** panel also contains some node pool properties that you can change, but which have been given sensible defaults.

6. Either just accept all the default configuration details and skip ahead to the next step to create the cluster immediately, or specify alternatives as follows:
   a. Either accept the default configuration details for the node pool, or specify alternatives in the **Create Node Pool** panel as follows:
      - **Shape:** The shape to use for each node in the node pool. The shape determines the number of CPUs and the amount of memory allocated to each node. The list shows only those shapes available in your tenancy that are supported by Container Engine for Kubernetes.
      - **Quantity per Subnet:** The number of worker nodes to create for the node pool in each private subnet.
      - **Public SSH Key:** (Optional) The public key portion of the key pair you want to use for SSH access to each node in the node pool. The public key is installed on all worker nodes in the cluster. Note that if you don't specify a public SSH key, Container Engine for Kubernetes will provide one. However, since you won't have the corresponding private key, you will not have SSH access to the worker nodes. Note that because worker nodes in a 'quick cluster' are in private subnets, you cannot use SSH to access them directly (see Connecting to Worker Nodes in Private Subnets Using SSH).
      - **Kubernetes Labels:** One or more labels (in addition to a default label) to add to worker nodes in the node pool to enable the targeting of workloads at specific node pools.
   b. Either accept the defaults for the remaining cluster details, or specify alternatives in the **Additional Add Ons** panel as follows:

- **Kubernetes Dashboard Enabled:** Select if you want to use the Kubernetes Dashboard to deploy and troubleshoot containerized applications, and to manage Kubernetes resources. See Starting the Kubernetes Dashboard.
- **Tiller (Helm) Enabled:** Select if you want Tiller (the server portion of Helm) to run in the Kubernetes cluster. With Tiller running in the cluster, you can use Helm to manage Kubernetes resources.

c. (Optional) Select **View Detail Page After This Cluster Is Requested** to return to the **Cluster Details** tab (rather than the **Cluster List** page) in the Console at the end of the cluster creation process.

7. Click **Create** to create the new network resources and the new cluster.
   Container Engine for Kubernetes starts creating:
   - the network resources (such as the VCN, internet gateway, NAT gateway, route tables, security lists, private subnets), named oke-<resource-type>-quick-<cluster-name>-<creation-date>
   - the cluster, with the name you specified
   - the node pool, named pool1
   - worker nodes, with names in the format `oke-c<part-of-cluster-OCID>-n<part-of-node-pool-OCID>-s<part-of-subnet-OCID>-<slot>`

   Note that if the cluster is not created successfully for some reason (for example, if you have insufficient permissions or if you've exceeded the cluster limit for the tenancy), any network resources created during the cluster creation process are not deleted automatically. You will have to manually delete any such unused network resources.
8. Click **Close** to return to the Console.

   If you selected **View Detail Page After This Cluster Is Requested**, you return to the **Cluster Details** tab in the console. If you didn't select **View Detail Page After This Cluster Is Requested**, you return to the **Cluster List** page.

   Initially, the new cluster appears in the Console with a status of Creating. When the cluster has been created, it has a status of Active.

Container Engine for Kubernetes also creates a Kubernetes kubeconfig configuration file that you use to access the cluster using kubectl and the Kubernetes Dashboard.

Using the Console to create a 'Custom Cluster' with Explicitly Defined Settings

To create a 'custom cluster' with explicitly defined settings and existing network resources using Container Engine for Kubernetes:

1. In the Console, open the navigation menu. Under **Solutions, Platform and Edge**, go to **Developer Services** and click **Container Clusters**.
2. Choose a **Compartment** you have permission to work in, and in which you want to create the new cluster.
3. On the **Cluster List** page, click **Create Cluster**.
4. Specify configuration details for the new cluster:
    - **Name:** The name of the new cluster. Either accept the default name or enter a name of your choice. Avoid entering confidential information.
    - **Kubernetes Version:** The version of Kubernetes to run on the master nodes of the cluster. Either accept the default version or select a version of your choice. Amongst other things, the Kubernetes version you select determines the default set of admission controllers that are turned on in the created cluster (the set follows the recommendation given in the Kubernetes documentation for that version).
5. Select **Custom Create** to create a new cluster by explicitly defining the new cluster's properties and which existing network resources to use.
6. Specify the existing network resources to use for the new cluster in the **Network Selection** panel:
    - **Network Compartment:** The compartment in which the existing network resources reside.
    - **VCN:** The existing virtual cloud network that has been configured for cluster creation and deployment. See VCN Configuration.

- **Kubernetes Service LB Subnets:** Optionally, the existing subnets that have been configured to host load balancers. Load balancer subnets must be different from worker node subnets, and can be public or private. You don't have to specify any load balancer subnets. However, if you do specify load balancer subnets, the number of load balancer subnets to specify depends on the region in which you are creating the cluster:
    - If you are creating a cluster in a region with three availability domains, you can specify zero or two load balancer subnets. If you specify two load balancer subnets, the two load balancer subnets must be in different availability domains.
    - If you are creating a cluster in a region with a single availability domain, you can specify zero or one load balancer subnet.

  Note that Container Engine for Kubernetes does not yet support regional subnets, so you cannot currently select a regional subnet when specifying a load balancer subnet.

  See Subnet Configuration.
- **Kubernetes Service CIDR Block:** The available group of network addresses that can be exposed as Kubernetes services (ClusterIPs), expressed as a single, contiguous IPv4 CIDR block. For example, 10.96.0.0/16. The CIDR block you specify must not overlap with the CIDR block for the VCN. See CIDR Blocks and Container Engine for Kubernetes.
- **Pods CIDR Block:** The available group of network addresses that can be allocated to pods running in the cluster, expressed as a single, contiguous IPv4 CIDR block. For example, 10.244.0.0/16. The CIDR block you specify must not overlap with the CIDR blocks for subnets in the VCN, and can be outside the VCN CIDR block. See CIDR Blocks and Container Engine for Kubernetes.

7. Specify remaining details for the cluster in the **Additional Add Ons** panel:
    - **Kubernetes Dashboard Enabled:** Select if you want to use the Kubernetes Dashboard to deploy and troubleshoot containerized applications, and to manage Kubernetes resources. See Starting the Kubernetes Dashboard.

- **Tiller (Helm) Enabled:** Select if you want Tiller (the server portion of Helm) to run in the Kubernetes cluster. With Tiller running in the cluster, you can use Helm to manage Kubernetes resources.

8. Click **Continue**.
9. (Optional) Specify configuration details for the first node pool in the cluster in the **Node Pool** panel:
    - **Name:** A name of your choice for the new node pool. Avoid entering confidential information.
    - **Version:** The version of Kubernetes to run on each worker node in the node pool. By default, the version of Kubernetes specified for the master nodes is selected. The Kubernetes version on worker nodes must be either the same version as that on the master nodes, or an earlier version that is still compatible. See Kubernetes Versions and Container Engine for Kubernetes.
    - **Image:** The image to use on each node in the node pool. An image is a template of a virtual hard drive that determines the operating system and other software for the node.
    - **Shape:** The shape to use for each node in the node pool. The shape determines the number of CPUs and the amount of memory allocated to each node. The list shows only those shapes available in your tenancy that are supported by Container Engine for Kubernetes.
    - **Subnets:** One or more subnets configured to host worker nodes. If you specified load balancer subnets, the worker node subnets must be different. The subnets you specify can be public or private. Note that Container Engine for Kubernetes does not yet support regional subnets, so you cannot currently select a regional subnet when specifying a worker node subnet. See Subnet Configuration.
    - **Quantity per Subnet:** The number of worker nodes to create for the node pool in each subnet.
    - **Public SSH Key:** (Optional) The public key portion of the key pair you want to use for SSH access to each node in the node pool. The public key is installed on all worker nodes in the cluster. Note that if you don't specify a public SSH key,

Container Engine for Kubernetes will provide one. However, since you won't have the corresponding private key, you will not have SSH access to the worker nodes. Note that you cannot use SSH to access directly any worker nodes in private subnets (see Connecting to Worker Nodes in Private Subnets Using SSH).

- **Kubernetes Labels:** One or more labels (in addition to a default label) to add to worker nodes in the node pool to enable the targeting of workloads at specific node pools.

10. (Optional) Click **Add node pool** and specify configuration details for a second and subsequent node pools in the cluster.
    If you define multiple node pools in a cluster, you can host all of them on a single subnet. However, it's recommended best practice to host different node pools for a cluster on different subnets, one in each availability domain in the region.
11. Click **Review** to confirm the resources that will be used and created.
12. (Optional) Select **View Detail Page After This Cluster Is Requested** to return to the **Cluster Details** tab (rather than the **Cluster List** page) in the Console at the end of the cluster creation process.
13. Click **Create** to create the new cluster.
    Container Engine for Kubernetes starts creating the cluster with the name you specified.
    If you specified details for one or more node pools, Container Engine for Kubernetes creates:
    - node pools with the names you specified
    - worker nodes with names in the format `oke-c<part-of-cluster-OCID>-n<part-of-node-pool-OCID>-s<part-of-subnet-OCID>-<slot>`

    If you selected **View Detail Page After This Cluster Is Requested**, you return to the **Cluster Details** tab in the console. If you didn't select **View Detail Page After This Cluster Is Requested**, you return to the **Cluster List** page.
14. Initially, the new cluster appears in the Console with a status of Creating. When the cluster has been created, it has a status of Active.
    Container Engine for Kubernetes also creates a Kubernetes kubeconfig configuration file that you use to access the cluster using kubectl and the Kubernetes Dashboard.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the CreateCluster operation to create a cluster.

Downloading a kubeconfig File to Enable Cluster Access

When you create a cluster, you need to download a Kubernetes configuration file (commonly known as a 'kubeconfig' file) for the cluster. The kubeconfig file (by default named `config` and stored in the `$HOME/.kube` directory) provides the necessary details to access the cluster using kubectl and the Kubernetes Dashboard.

You have to follow a number of steps to download the kubeconfig file. Having completed the steps, you can start using kubectl and the Kubernetes Dashboard to manage the cluster.

To download the kubeconfig file:

Step 1: Generate an API signing key pair

If you already have an API signing key pair, go straight to the next step. If not:

1. Use OpenSSL commands to generate the key pair in the required PEM format. If you're using Windows, you'll need to install Git Bash for Windows and run the commands with that tool. See How to Generate an API Signing Key.
2. Copy the contents of the public key to the clipboard (you'll need to paste the value into the Console later).

Step 2: Upload the public key of the API signing key pair

1. In the top-right corner of the Console, open the **User** menu () and then click **User Settings** to view the details.

2. Click **Add Public Key**.
3. Paste the public key's value into the window and click **Add**.
   The key is uploaded and its fingerprint is displayed (for example, d1:b2:32:53:d3:5f:cf:68:2d:6f:8b:5f:77:8f:07:13).

Step 3: Install and configure the Oracle Cloud Infrastructure CLI

1. Install the Oracle Cloud Infrastructure CLI. See Quickstart.
2. Configure the Oracle Cloud Infrastructure CLI. See Configuration.

Step 4: Download the kubeconfig file

1. In the Console, open the navigation menu. Under **Solutions, Platform and Edge**, go to **Developer Services** and click **Container Clusters**.
2. Choose a **Compartment** you have permission to work in.
3. On the **Cluster List** page, click the name of the cluster you want to access using kubectl and the Kubernetes Dashboard. The **Cluster** page shows details of the cluster.
4. Click the **Access Kubeconfig** button to display the **How to Access Kubeconfig** dialog box.
5. Create a directory to contain the kubeconfig file. By default, the expected directory name is `$HOME/.kube`.
   For example, on Linux, enter the following command (or copy and paste it from the **How to Access Kubeconfig** dialog box):

   ```
   $ mkdir -p $HOME/.kube
   ```

6. Run the Oracle Cloud Infrastructure CLI command to download the kubeconfig file and save it in a location accessible to kubectl and the Kubernetes Dashboard.

For example, on Linux, enter the following command (or copy and paste it from the **How to Access Kubeconfig** dialog box):

```
$ oci ce cluster create-kubeconfig --cluster-id ocid1.cluster.oc1.phx.aaaaaaaaae... --file
$HOME/.kube/config  --region us-phoenix-1
```

where ocid1.cluster.oc1.phx.aaaaaaaaae... is the OCID of the current cluster. For convenience, the command in the **How to Access Kubeconfig** dialog box already includes the cluster's OCID.

Note that if a kubeconfig file already exists in the location you specify, details about the cluster will be added as a new context to the existing kubeconfig file. The `current-context:` element in the kubeconfig file will be set to point to the newly added context.

7. Set the value of the KUBECONFIG environment variable to point to the name and location of the kubeconfig file. For example, on Linux, enter the following command (or copy and paste it from the **How to Access Kubeconfig** dialog box):

```
$ export KUBECONFIG=$HOME/.kube/config
```

Step 5: Verify that kubectl is available

1. Verify that kubectl is available by entering the following command:

```
$ kubectl version
```

Information about the versions of Kubernetes running in the cluster is shown.

2. Verify that kubectl can connect to the cluster by entering the following command:

```
$ kubectl get nodes
```

Information about the nodes in the cluster is shown.

You can now use kubectl and the Kubernetes Dashboard to perform operations on the cluster.

Note

The kubeconfig file contains credentials to access the cluster, including a hashed version of the private key component of your API signing key pair. The kubeconfig file is therefore specific to you, and is valid for as long as your API signing key pair is valid. Best practice is not to share the kubeconfig file with other users. If you do share the kubeconfig file with other users, be aware that those users will be able to access all the clusters to which you have access in the tenancy.

Modifying a Kubernetes Cluster

You can use Container Engine for Kubernetes to modify the node pool details of existing Kubernetes clusters.

You can change:

- the name of the node pool
- the number of node pools in a cluster by adding new node pools, or deleting existing node pools
- the number of worker nodes in a node pool by changing:
    - the number of subnets used by a node pool
    - the number of worker nodes in each subnet
- the version of Kubernetes to run on new worker nodes

However, note that you cannot change:

- the name of the cluster
- the shape of existing worker nodes

- the operating system running on existing worker nodes
- the version of Kubernetes running on existing worker nodes

Using the Console

To modify an existing Kubernetes cluster:

1. In the Console, open the navigation menu. Under **Solutions, Platform and Edge**, go to **Developer Services** and click **Container Clusters**.
2. Choose a **Compartment** you have permission to work in.
3. On the **Cluster List** page, click the name of the cluster you want to modify.
4. Use the buttons across the top of the **Cluster** page as follows:
    - If you want to download the kubeconfig configuration file for the cluster, click the **Access Kubeconfig** button (see Downloading a kubeconfig File to Enable Cluster Access).
    - If you want to add a new node pool to the cluster, click the **Add Node Pool** button and enter details for the new node pool.
    - If you want to delete the cluster along with its master nodes and worker nodes, click the **Delete Cluster** button.
    - If a newer version of Kubernetes is available than the one running on the master nodes in the cluster, the **Upgrade Available** button is enabled. If you want to upgrade the master nodes to a newer version, click **Upgrade Available** (see Upgrading the Version of Kubernetes Running on Master Nodes).
5. Use the **Cluster Details** tab to see information about the cluster, including:
    - The status of the cluster, and of the node pools in the cluster.
    - The cluster's OCID.
    - The Kubernetes version running on the master nodes in the cluster.
    - The address of the Kubernetes endpoint.

6. Use the **Node Pools** tab to:
    - View a summary of each node pool and the worker nodes within it.
    - Change the name of a node pool by selecting **Edit** from the **Actions** menu.
    - Change the number of worker nodes in a node pool by selecting **Scale** from the **Actions** menu and specifying the number of subnets used by a node pool and the number of worker nodes in each subnet.
    - View and edit configuration details of specific worker nodes by selecting **Show Node Details** and clicking the name of the worker node.
    - Delete a node pool by selecting **Delete Node Pool** from the **Actions** menu.
7. Use the **Getting Started** tab to:
    - View and copy the commands to start the Kubernetes Dashboard to view the deployed application running on nodes in the cluster (see Starting the Kubernetes Dashboard).
    - View and copy the commands to download and deploy a sample nginx application using the Kubernetes command line tool kubectl from the instructions in a manifest file (see Deploying a Sample Nginx App on a Cluster Using kubectl).

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the Update Cluster and the UpdateNodePool operations to modify an existing Kubernetes cluster.

Deleting a Kubernetes Cluster

You can delete a cluster along with its master nodes and worker nodes.

Using the Console

To delete a Kubernetes cluster using Container Engine for Kubernetes:

1. In the Console, open the navigation menu. Under **Solutions, Platform and Edge**, go to **Developer Services** and click **Container Clusters**.
2. Choose a **Compartment** you have permission to work in.
3. On the **Cluster List** page, click the Delete icon beside the name of the cluster to delete, and confirm that you want to delete it.

You can also delete a cluster using the **Delete Cluster** button on the **Cluster** page.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the DeleteCluster operation to delete a cluster.

Monitoring Clusters

Having created a cluster, you can monitor the status of the cluster itself, and the nodes and node pools within it.

Using the Console

To monitor a Kubernetes cluster:

1. In the Console, open the navigation menu. Under **Solutions, Platform and Edge**, go to **Developer Services** and click **Container Clusters**.
2. Choose a **Compartment** you have permission to work in.

The **Status** column on the **Cluster List** page shows a summary status for each individual cluster and its master nodes. Clusters can have one of the following statuses:

Cluster Status	Explanation	Possible Reason
Creating	Cluster is in the process of being created.	Application is being deployed.
Active	Cluster is running normally.	Master nodes are running normally.
Failed	Cluster is not running due to an unrecoverable error.	Possible reasons: • a problem setting up load balancers • an error installing cluster add-ons (Tiller, Kubernetes dashboard) • conflicts in networking ranges
Deleting	Cluster is in the process of being deleted. Application no longer required, so resources in the process of being released.	Application no longer required, so resources in the process of being released.
Deleted	Cluster has been deleted. Application no longer required, so resources have been released.	Application no longer required, so resources have been released.
Updating	Version of Kubernetes on the master nodes is in the process of being upgraded.	A newly supported version of Kubernetes has become available.

Note that the cluster's summary status is not necessarily directly related to the status of node pools and nodes within the cluster.

3. On the **Cluster List** page, click the name of the cluster for which you want to see detailed status.
   The **Cluster Details** tab shows the summary status for the cluster and its master nodes.
4. Use the **Node Pools** tab to see the status of individual nodes within each node pool.
   Nodes can have one of the following statuses:

Node Status	Explanation	Possible Reason
Creating	Node is being created.	Compute instance in the process of being created.
Active	Node is running normally.	Node is running normally.
Updating	Node is in the process of being updated.	Container Engine for Kubernetes is performing an operation on the node.
Deleting	Node is in the process of being deleted.	Application no longer required, so resources in the process of being released.
Deleted	Node has been deleted.	Application no longer required, so resources have been released.
Inactive	Node still exists, but is not running.	Compute resource has a status of Stopped, Stopping, or Down For Maintenance.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line

Interface.

Use the GetCluster and GetNodePool operations to monitor the status of Kubernetes clusters.

Monitoring Operations of Container Engine for Kubernetes

You can monitor operations performed by Container Engine for Kubernetes as follows:

- You can monitor and manage operations performed on a particular cluster by Container Engine for Kubernetes using the Work Requests tab of the cluster's Summary page.
- You can view all operations performed by Container Engine for Kubernetes as log events using the Oracle Cloud Infrastructure Audit service.

Using the Console

To monitor and manage operations performed on a particular cluster:

1. In the Console, open the navigation menu. Under **Solutions, Platform and Edge**, go to **Developer Services** and click **Container Clusters**.
2. Choose a **Compartment** you have permission to work in.
3. On the **Cluster List** page, click the name of the cluster for which you want to monitor and manage operations.
   The **Cluster** page shows information about the cluster.

To view all operations performed by Container Engine for Kubernetes as log events:

1. In the Console, open the navigation menu. Under **Governance and Administration**, go to **Governance** and click **Policies**.
2. Choose a **Compartment** you have permission to work in.
3. Search and filter to show the operations performed by Container Engine for Kubernetes. See Viewing Audit Log Events.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the GetWorkRequest, DeleteWorkRequest, ListWorkRequestErrors, ListWorkRequestLogs, and ListWorkRequests operations to monitor and manage operations performed by Container Engine for Kubernetes.

Accessing a Cluster Using kubectl

You can use the Kubernetes command line tool kubectl to perform operations on a cluster you've created with Container Engine for Kubernetes. Before you can use kubectl you need to specify the cluster on which to perform operations.

To access a cluster using kubectl:

1. If you haven't already done so, install kubectl (see the kubectl documentation).
2. If you haven't already done so, download the cluster's kubeconfig configuration file and set the KUBECONFIG environment variable to point to the file. See Downloading a kubeconfig File to Enable Cluster Access.
3. In a terminal window, enter `kubectl` followed by the command for the operation you want to perform on the cluster. For a list of available commands and options, see the kubectl documentation.
   Note that you must have the appropriate permissions to run the command you enter. See About Access Control and Container Engine for Kubernetes.

Starting the Kubernetes Dashboard

Kubernetes Dashboard is a web-based user interface that you can use as an alternative to the Kubernetes kubectl command line tool to:

- deploy containerized applications to a Kubernetes cluster
- troubleshoot your containerized applications

You use the Kubernetes Dashboard to get an overview of applications running on a cluster, as well as to create or modify individual Kubernetes resources. The Kubernetes Dashboard also reports the status of Kubernetes resources in the cluster, and any errors that have occurred. Note that to use the Kubernetes Dashboard, it must have been enabled when the cluster was initially created.

In contrast to the Kubernetes Dashboard, Container Engine for Kubernetes enables you to create and delete Kubernetes clusters and node pools, and to manage the associated compute, network, and storage resources.

Before you can use the Kubernetes Dashboard, you need to specify the cluster on which to perform operations.

To start the Kubernetes Dashboard:

1. If you haven't already done so, download the cluster's kubeconfig configuration file and set the KUBECONFIG environment variable to point to the file. See Downloading a kubeconfig File to Enable Cluster Access.
2. In a terminal window, enter `kubectl proxy` to start the Kubernetes Dashboard.
3. Open a browser and go to `http://localhost:8001/api/v1/namespaces/kube-system/services/https:kubernetes-dashboard:/proxy/` to display the Kubernetes Dashboard.
4. Click **Overview** to see the applications deployed on the cluster.

Deploying a Sample Nginx App on a Cluster Using kubectl

Having created a Kubernetes cluster using Container Engine for Kubernetes, you'll typically want to try it out by deploying an application on the nodes in the cluster. For convenience, the **Cluster** page includes a **Getting Started** tab that makes it easy to view and copy the commands to:

- download the kubeconfig configuration file for the cluster
- download and deploy a sample Nginx application using the Kubernetes command line tool kubectl from the instructions in a manifest file

- start the Kubernetes Dashboard to view the deployed application running on nodes in the cluster

To deploy the sample nginx application:

1. If you haven't already done so, download the cluster's kubeconfig configuration file and set the KUBECONFIG environment variable to point to the file. See Downloading a kubeconfig File to Enable Cluster Access.
2. In a terminal window, deploy the sample Nginx application by entering `kubectl create -f https://k8s.io/docs/tasks/run-application/deployment.yaml`

Tip

If the command fails to connect to `https://k8s.io/docs/tasks/run-application/deployment.yaml` , go to the url in a browser and download the manifest file `deployment.yaml` to a local directory. Repeat the `kubectl create` command and specify the local location of the `deployment.yaml` file.

3. Use the Kubernetes Dashboard or kubectl to confirm that the sample application has deployed successfully. For example:
    a. Enter `kubectl proxy` to start the Kubernetes Dashboard.
    b. Open a browser and go to `http://localhost:8001/api/v1/namespaces/kube-system/services/https:kubernetes-dashboard:/proxy/` to display the Kubernetes Dashboard.
    c. Click **Overview** to see the applications deployed on the cluster.

You can see the Nginx sample application has been deployed as two pods, on two nodes in the cluster.

Pulling Images from Registry during Deployment

During the deployment of an application to a Kubernetes cluster, you'll typically want one or more images to be pulled from a Docker registry. In the application's manifest file you specify the images to pull, the registry to pull them from, and the credentials to use when pulling the images. The manifest file is commonly also referred to as a pod spec, or as a deployment.yaml file (although other filenames are allowed).

If you want the application to pull images that reside in Oracle Cloud Infrastructure Registry, you have to perform two steps:

- You have to use kubectl to create a Docker registry secret. The secret contains the Oracle Cloud Infrastructure credentials to use when pulling the image. When creating secrets, Oracle strongly recommends you use the latest version of kubectl (see the kubectl documentation).
- You have to specify the image to pull from Oracle Cloud Infrastructure Registry, including the repository location and the Docker registry secret to use, in the application's manifest file.

To create a Docker registry secret:

1. If you haven't already done so, download the cluster's kubeconfig configuration file and set the KUBECONFIG environment variable to point to the file. See Downloading a kubeconfig File to Enable Cluster Access.
2. In a terminal window, enter:

   ```
   $ kubectl create secret docker-registry <secret-name> --docker-server=<region-code>.ocir.io --docker-username='<tenancy-name>/<oci-username>' --docker-password='<oci-auth-token>' --docker-email='<email-address>'
   ```

   where:

   - `<secret-name>` is a name of your choice, that you will use in the manifest file to refer to the secret . For example, `ocirsecret`
   - `<region-code>` is the code for the Oracle Cloud Infrastructure Registry region you're using. For example, `iad`. See Availability by Region Name and Region Code for the list of region codes.

- `ocir.io` is the Oracle Cloud Infrastructure Registry name.
- `<tenancy-name>` is the tenancy containing the repository from which the application is to pull the image. For example, `acme-dev`
- `<oci-username>` is the username to use when pulling the image. The username must have access to the tenancy specified by `<tenancy-name>`. For example, `jdoe@acme.com` . If your tenancy is federated with Oracle Identity Cloud Service, use the format `oracleidentitycloudservice/<username>`
- `<oci-auth-token>` is the auth token of the user specified by `<oci-username>`. For example, `k]j64r{1sJSSF-;)K8`
- `<email-address>` is an email address. An email address is required, but it doesn't matter what you specify. For example, `jdoe@acme.com`

Note the use of single quotes around strings containing special characters.

For example, combining the previous examples, you might enter:

```
$ kubectl create secret docker-registry ocirsecret --docker-server=phx.ocir.io --docker-
username='acme-dev/jdoe@acme.com' --docker-password='k]j64r{1sJSSF-;)K8' --docker-
email='jdoe@acme.com'
```

Having created the Docker secret, you can now refer to it in the application manifest file.

To specify the image to pull from Oracle Cloud Infrastructure Registry, along with the Docker secret to use, during deployment of an application to a cluster:

1. Open the application's manifest file in a text editor.
2. Add the following sections to the manifest file:
    a. Add a `containers` section that specifies the name and location of the container you want to pull from Oracle Cloud Infrastructure Registry, along with other deployment details.
    b. Add an `imagePullSecrets` section to the manifest file that specifies the name of the Docker secret you created to access the Oracle Cloud Infrastructure Registry.

Here's an example of what the manifest might look like when you've added the `containers` and `imagePullSecrets` sections:

```
apiVersion: v1
kind: Pod
metadata:
  name: ngnix-image
spec:
  containers:
    - name: ngnix
      image: phx.ocir.io/acme-dev/project01/ngnix-lb:latest
      imagePullPolicy: Always
      ports:
      - name: nginx
        containerPort: 8080
        protocol: TCP
  imagePullSecrets:
    - name: ocirsecret
```

3. Save and close the manifest file.

Connecting to Worker Nodes Using SSH

If you provided a public SSH key when creating the node pool in a cluster, the public key is installed on all worker nodes in the cluster. On UNIX and UNIX-like platforms (including Solaris and Linux), you can then connect through SSH to the worker nodes using the ssh utility (an SSH client) to perform administrative tasks.

Note the following instructions assume the UNIX machine you use to connect to the worker node:

- Has the ssh utility installed.
- Has access to the SSH private key file paired with the SSH public key that was specified when the cluster was created.

How to connect to worker nodes using SSH depends on whether you specified public or private subnets for the worker nodes when defining the node pools in the cluster.

Connecting to Worker Nodes in Public Subnets Using SSH

Before you can connect to a worker node in a public subnet using SSH, you must define an ingress rule in the subnet's security list to allow SSH access. The ingress rule must allow access to port 22 on worker nodes from source 0.0.0.0/0 and any source port, as follows:

Type	Source CIDR	IP Protocol	Source Port Range	Dest. Port Range	Type and Code	Allows: and Description:
Stateful	0.0.0.0/0	TCP	All	22	n/a	**Allows:** TCP traffic for ports: 22 SSH Remote Login Protocol **Description:** Enables SSH access.

To connect to a worker node in a public subnet through SSH from a UNIX machine using the ssh utility:

1. Find out the IP address of the worker node to which you want to connect. You can do this in a number of ways:
    - Using kubectl. If you haven't already done so, download the cluster's kubeconfig configuration file and set the KUBECONFIG environment variable to point to the file. See Downloading a kubeconfig File to Enable Cluster Access. Then in a terminal window, enter `kubectl get nodes` to see the public IP addresses of worker nodes in node pools in the cluster.
    - Using the Console. In the Console, display the **Cluster List** page and then select the cluster to which the worker node belongs. Click **Node Pools** to see the public IP addresses of worker nodes in every node pool in the cluster.
    - Using the REST API. Use the ListNodePools operation to see the public IP addresses of worker nodes in a node pool.
2. In the terminal window, enter `ssh opc@<node_ip_address>` to connect to the worker node, where `<node_ip_address>` is the IP address of the worker node that you made a

note of earlier. For example, you might enter `ssh opc@192.0.2.254`.

Note that if the SSH private key is not stored in the file or in the path that the ssh utility expects (for example, the ssh utility might expect the private key to be stored in ~/.ssh/id_rsa), you must explicitly specify the private key filename and location in one of two ways:

- Use the `-i` option to specify the filename and location of the private key. For example, `ssh -i ~/.ssh/my_keys/my_host_key_filename opc@192.0.2.254`
- Add the private key filename and location to an SSH configuration file, either the client configuration file (~/.ssh/config) if it exists, or the system-wide client configuration file (/etc/ssh/ssh_config). For example, you might add the following:

```
Host 192.0.2.254 IdentityFile ~/.ssh/my_keys/my_host_key_filename
```

For more about the ssh utility's configuration file, enter `man ssh_config`

Note also that permissions on the private key file must allow you read/write/execute access, but prevent other users from accessing the file. For example, to set appropriate permissions, you might enter `chmod 600 ~/.ssh/my_keys/my_host_key_filename`. If permissions are not set correctly and the private key file is accessible to other users, the ssh utility will simply ignore the private key file.

Connecting to Worker Nodes in Private Subnets Using SSH

Worker nodes in private subnets have private IP addresses only (they do not have public IP addresses). They can only be accessed by other resources inside the VCN. Oracle recommends using bastion hosts to control external access (such as SSH) to worker nodes in private subnets. A bastion host is in a public subnet, has a public IP address, and is accessible from the internet. For more information about bastion hosts, see the white paper Bastion Hosts: Protected Access for Virtual Cloud Networks.

About Access Control and Container Engine for Kubernetes

To perform operations on a Kubernetes cluster, you must have appropriate permissions to access the cluster.

For most operations on Kubernetes clusters created and managed by Container Engine for Kubernetes, Oracle Cloud Infrastructure Identity and Access Management (IAM) provides access control. A user's permissions to access clusters comes from the groups to which they belong. The permissions for a group are defined by policies. Policies define what actions members of a group can perform, and in which compartments. Users can then access clusters and perform operations based on the policies set for the groups they are members of.

IAM provides control over:

- whether a user can create or delete clusters
- whether a user can add, remove, or modify node pools
- which Kubernetes object create/delete/view operations a user can perform on all clusters within a compartment or tenancy

See Policy Configuration for Cluster Creation and Deployment.

In addition to IAM, the Kubernetes RBAC Authorizer can enforce additional fine-grained access control for users on specific clusters via Kubernetes RBAC roles and clusterroles. A Kubernetes RBAC role is a collection of permissions. For example, a role might include read permission on pods and list permission for pods. A Kubernetes RBAC clusterrole is just like a role, but can be used anywhere in the cluster. A Kubernetes RBAC rolebinding maps a role to a user or set of users, granting that role's permissions to those users for resources in that namespace. Similarly, a Kubernetes RBAC clusterrolebinding maps a clusterrole to a user or set of users, granting that clusterrole's permissions to those users across the entire cluster.

IAM and the Kubernetes RBAC Authorizer work together to enable users who have been successfully authorized by at least one of them to complete the requested Kubernetes operation.

When a user attempts to perform any operation on a cluster (except for create role and create clusterrole operations), IAM first determines whether the group to which the user belongs has

the appropriate and sufficient permissions. If so, the operation succeeds. If the attempted operation also requires additional permissions granted via a Kubernetes RBAC role or clusterrole, the Kubernetes RBAC Authorizer then determines whether the user has been granted the appropriate Kubernetes role or clusterrole.

Typically, you'll want to define your own Kubernetes RBAC roles and clusterroles when deploying a Kubernetes cluster to provide additional fine-grained control. When you attempt to perform a create role or create clusterrole operation, the Kubernetes RBAC Authorizer first determines whether you have sufficient Kubernetes privileges. To create a role or clusterrole, you must have been assigned an existing Kubernetes RBAC role (or clusterrole) that has at least the same or higher privileges as the new role (or clusterrole) you're attempting to create.

By default, users are not assigned any Kubernetes RBAC roles (or clusterroles). So before attempting to create a new role (or clusterrole), you must be assigned an appropriately privileged role (or clusterrole). A number of such roles and clusterroles are always created by default, including the cluster-admin clusterrole (for a full list, see Default Roles and Role Bindings in the Kubernetes documentation). The cluster-admin clusterrole essentially confers super-user privileges. A user granted the cluster-admin clusterrole can perform any operation across all namespaces in a given cluster.

Example: Granting the Kubernetes RBAC cluster-admin clusterrole

Note

The following instructions assume:

- You're in the tenancy's Administrators group, and therefore have the required permissions to access clusters.
- You have the Kubernetes RBAC cluster-admin clusterrole, and therefore have the required

access to create Kubernetes RBAC roles and clusterroles.

Follow these steps to grant a user the Kubernetes RBAC cluster-admin clusterrole on a cluster deployed on Oracle Cloud Infrastructure:

1. If you haven't already done so, download the cluster's kubeconfig configuration file and set the KUBECONFIG environment variable to point to the file. See Downloading a kubeconfig File to Enable Cluster Access.
2. In a terminal window, grant the Kubernetes RBAC cluster-admin clusterrole to the user by entering:

   ```
   $ kubectl create clusterrolebinding <my-cluster-admin-binding> --clusterrole=cluster-admin --
   user=<user_OCID>
   ```

   where:

   - `<my-cluster-admin-binding>` is a string of your choice to be used as the name for the binding between the user and the Kubernetes RBAC cluster-admin clusterrole. For example, `jdoe_clst_adm`
   - `<user_OCID>` is the user's OCID (obtained from the Console). For example, `ocid1.user.oc1..aaaaa...zutq` (abbreviated for readability).

   For example:

   ```
   $ kubectl create clusterrolebinding jdoe_clst_adm --clusterrole=cluster-admin --
   user=ocid1.user.oc1..aaaaa...zutq
   ```

Example: Giving a developer user the ability to read pods in a new cluster

Note

The following instructions assume:

- You're in the tenancy's Administrators group, and therefore have the required permissions to create clusters, and to manage users and groups.
- You have the Kubernetes RBAC cluster-admin clusterrole, and therefore have the required access to create Kubernetes RBAC roles and clusterroles.

Follow these steps to give a developer the necessary Oracle Cloud Infrastructure and Kubernetes RBAC permissions to use kubectl to view pods running on a cluster deployed on Oracle Cloud Infrastructure:

1. Create a new Oracle Cloud Infrastructure user for the developer to use (for example, called jdoe@acme.com), and make a note of the new user's OCID (for example, `ocid1.user.oc1..aaaaa...tx5a`, abbreviated for readability). See To create a user.
2. Create a new Oracle Cloud Infrastructure group and add the new user to the group (for example, called acme-dev-pod-vwr). See To create a group.
3. Create a new Oracle Cloud Infrastructure policy that grants the new group the CLUSTER_USE permission on clusters in the tenancy, with a policy statement like:

   ```
   Allow group acme-dev-pod-vwr to use clusters in tenancy
   ```

   See To create a policy.
4. Create a new cluster in the Console. See Creating a Kubernetes Cluster .
5. Download the cluster's kubeconfig configuration file and set the KUBECONFIG environment variable to point to the file. See Downloading a kubeconfig File to Enable Cluster Access.
6. In a text editor, create a file (for example, called role-pod-reader.yaml) with the following content. This file defines a Kubernetes RBAC role that enables users to read pod details.

   ```
   kind: Role
   apiVersion: rbac.authorization.k8s.io/v1
   ```

```
metadata:
 namespace: default
 name: pod-reader
rules:
- apiGroups: [""] # "" indicates the core API group
  resources: ["pods"]
  verbs: ["get", "watch", "list"]
```

7. In a terminal window, create the new role in the cluster using kubectl. For example, if you gave the yaml file that defines the new role the name role-pod-reader.yaml, enter the following:

```
$ kubectl create -f role-pod-reader.yaml
```

8. In a terminal window, bind the Kubernetes RBAC role you just created to the Oracle Cloud Infrastructure user account you created earlier by entering the following to create a new rolebinding (in this case, called pod-reader-binding):

```
$ kubectl create rolebinding pod-reader-binding --role=pod-reader --
user=ocid1.user.oc1..aaaaa...tx5a
```

9. Give the developer the credentials of the new Oracle Cloud Infrastructure user you created earlier, and tell the developer they can now see details of pods running on the cluster deployed on Oracle Cloud Infrastructure by:
    - Signing in to the Console using the new user's credentials.
    - Following the instructions in Downloading a kubeconfig File to Enable Cluster Access to obtain their own copy of the cluster's kubeconfig file. If the file does not have the expected default name and location of `$HOME/.kube/config`, the developer will also have to set the KUBECONFIG environment variable to point to the file. The developer's copy of the kubeconfig file will contain a hashed version of the public key component of their API signing key pair.
    - Using kubectl to see details of the pods by entering:

      ```
      $ kubectl get pods
      ```

Kubernetes Versions and Container Engine for Kubernetes

When you create a new Kubernetes cluster using Container Engine for Kubernetes, you specify:

- The version of Kubernetes to run on the master nodes in the cluster.
- The version of Kubernetes to run on the worker nodes in each node pool. All worker nodes in the same node pool run the same version of Kubernetes. Different node pools in a cluster can run different versions of Kubernetes.

The version of Kubernetes that you specify for the worker nodes in a node pool must be either the same Kubernetes version as that running on the master nodes, or an earlier Kubernetes version that is still compatible. In other words:

- The master nodes in a new cluster must run the same version of Kubernetes as the version running on worker nodes, or must be no more than two versions ahead.
- The worker nodes in a node pool must not run a more recent version of Kubernetes than the associated master nodes.

About Kubernetes Versions

New versions of Kubernetes are released periodically that contain new features and bug fixes.

Kubernetes version numbers have the format `x.y.z` where `x` is a major release, `y` is a minor release, and `z` is a patch release. For example, 1.12.7.

Kubernetes itself is supported for three minor versions at a time (the current release version and two previous versions).

As described in the Kubernetes documentation, a certain amount of version variation is permissible between master nodes and worker nodes in a cluster:

- The Kubernetes version on worker nodes can lag behind the version on the master nodes by up to two versions, but no more. If the version on the worker nodes is more than two versions behind the version on the master nodes, the Kubernetes versions on the worker nodes and the master nodes are incompatible.

- The Kubernetes version on worker nodes must never be more recent than the version on the master nodes.

About Upgrading Clusters to Newer Kubernetes Versions

After a new version of Kubernetes has been released and when Container Engine for Kubernetes supports the new version, you can use Container Engine for Kubernetes to upgrade master nodes running older versions of Kubernetes. Because Container Engine for Kubernetes distributes the Kubernetes Control Plane on multiple Oracle-managed master nodes (distributed across different availability domains in a region where supported) to ensure high availability, you're able to upgrade the Kubernetes version running on master nodes with zero downtime.

Having upgraded master nodes to a new version of Kubernetes, you can subsequently create new node pools running the newer version. Alternatively, you can continue to create new node pools that will run older versions of Kubernetes (providing those older versions are compatible with the Kubernetes version running on the master nodes).

Note that you upgrade master nodes by performing an ‘in-place’ upgrade, but you upgrade worker nodes by performing an ‘out-of-place’ upgrade. To upgrade the version of Kubernetes running on worker nodes in a node pool, you replace the original node pool with a new node pool that has new worker nodes running the appropriate Kubernetes version. Having 'drained' existing worker nodes in the original node pool to prevent new pods starting and to delete existing pods, you can then delete the original node pool.

Also note the following:

- Container Engine for Kubernetes only upgrades the Kubernetes version running on master nodes when you explicitly initiate the upgrade operation.
- After upgrading master nodes to a newer version of Kubernetes, you cannot downgrade the master nodes to an earlier Kubernetes version.
- Before you upgrade the version of Kubernetes running on the master nodes, it is your responsibility to test that applications deployed on the cluster are compatible with the new Kubernetes version. For example, before upgrading the existing cluster, you might create a new separate cluster with the new Kubernetes version to test your applications.

- The versions of Kubernetes running on the master nodes and the worker nodes must be compatible (that is, the Kubernetes version on the master nodes must be no more than two minor versions ahead of the Kubernetes version on the worker nodes).
- If the version of Kubernetes currently running on the master nodes is more than one version behind the most recent supported version, you are given a choice of versions to upgrade to. If you want to upgrade to a version of Kubernetes that is more than one version ahead of the version currently running on the master nodes, you must upgrade to each intermediate version in sequence without skipping versions. For example, if you want to upgrade the master nodes from Kubernetes version 1.10.11 to Kubernetes version 1.12.7, you must first upgrade the master nodes from version 1.10.11 to version 1.11.9, and then from version 1.11.9 to version 1.12.7.

Kubernetes Versions Supported by Container Engine for Kubernetes

Container Engine for Kubernetes supports the following versions of Kubernetes:

Kubernetes Version	Supported by Container Engine for Kubernetes?	Notes
1.10.x and earlier	No	N/A
1.11.9	Yes	Note that versions of Kubernetes 1.11.x prior to 1.11.9 (for example, 1.11.8) are no longer supported. You cannot: • create clusters running earlier 1.11.x versions • add new node pools to existing clusters running earlier 1.11.x versions If you do have clusters running 1.11.x versions earlier than 1.11.9, Oracle strongly recommends you upgrade those clusters to version 1.11.9 or version 1.12.7.

Kubernetes Version	Supported by Container Engine for Kubernetes?	Notes
1.12.7	Yes	Note that versions of Kubernetes 1.12.x prior to 1.12.7 (for example, 1.12.6) are no longer supported. You cannot: • create clusters running earlier 1.12.x versions • add new node pools to existing clusters running earlier 1.12.x versions If you do have clusters running 1.12.x versions earlier than 1.12.7, Oracle strongly recommends you upgrade those clusters to version 1.12.7.

Upgrading the Version of Kubernetes Running on Master Nodes

When Container Engine for Kubernetes supports a newer version of Kubernetes than the version currently running on the master nodes in a cluster, you can upgrade the Kubernetes version running on the master nodes.

Important: After you've upgraded master nodes to a newer version of Kubernetes, you can't downgrade the master nodes to an earlier Kubernetes version. It's therefore important that before you upgrade the version of Kubernetes running on the master nodes, you test that applications deployed on the cluster are compatible with the new Kubernetes version.

Using the Console

To upgrade the version of Kubernetes running on the master nodes:

1. In the Console, open the navigation menu. Under **Solutions, Platform and Edge**, go to **Developer Services** and click **Container Clusters**.
2. Choose a **Compartment** you have permission to work in.
3. On the **Cluster List** page, click the name of the cluster where you want to upgrade the version of Kubernetes running on the master nodes.
   If a newer version of Kubernetes is available than the one running on the master nodes in the cluster, the **Upgrade Available** button is enabled at the top of the **Cluster** page.
4. Click **Upgrade Available** to upgrade the master nodes to a newer version.
5. In the **Upgrade Cluster Master** dialog box, select the version of Kubernetes to which to upgrade the master nodes, and click **Confirm**.

The version of Kubernetes running on the master nodes is upgraded. From now on, the new version of Kubernetes will appear as an option when you're defining new node pools for the cluster.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the UpdateCluster operation to upgrade the version of Kubernetes running on the master nodes.

'Upgrading' the version of Kubernetes running on worker nodes by creating a new node pool

To 'upgrade' the version of Kubernetes running on worker nodes in a node pool, you replace the original node pool with a new node pool that has new worker nodes running the appropriate Kubernetes version. Having 'drained' existing worker nodes in the original node

pool to prevent new pods starting and to delete existing pods, you can then delete the original node pool.

To 'upgrade' the version of Kubernetes on worker nodes by creating a new node pool:

1. In the Console, open the navigation menu. Under **Solutions, Platform and Edge**, go to **Developer Services** and click **Container Clusters**.
2. Choose a **Compartment** you have permission to work in.
3. On the **Cluster List** page, click the name of the cluster where you want to change the Kubernetes version running on worker nodes.
4. On the **Cluster** page, click **Add Node Pool** to create a new node pool and specify the required version of Kubernetes for its worker nodes.

   The version of Kubernetes you specify must be compatible with the version that is running on the master nodes.
5. If there are labels attached to worker nodes in the original node pool and those labels are used by selectors (for example, to determine the nodes on which to run pods), then use the `kubectl label nodes` command to attach the same labels to the new worker nodes in the new node pool. See Assigning Pods to Nodes in the Kubernetes documentation.
6. For each worker node in the original node pool, prevent new pods from starting and delete existing pods by entering `kubectl drain <node_name>` for each worker node.

   For more information:

   - about using kubectl, see Accessing a Cluster Using kubectl
   - about the drain command, see drain in the Kubernetes documentation

   Recommended: Leverage pod disruption budgets as appropriate for your application to ensure that there's a sufficient number of replica pods running throughout the drain operation.

   After all the worker nodes have been drained from the original node pool and pods are running on worker nodes in the new node pool, you can delete the original node pool.
7. On the **Cluster** page, display the **Node Pools** tab and select **Delete Node Pool** from the **Actions** menu.

   The original node pool and all its worker nodes are deleted.

Creating Load Balancers to Distribute Traffic Between Cluster Nodes

When you create a service, you can optionally create a load balancer to distribute service traffic among the nodes assigned to that service. The key fields in the configuration of a load balancer are the **type** of service being created and the **ports** that the load balancer will listen to.

Creating Load Balancers to Distribute HTTP Traffic

Consider the following configuration file, `nginx_lb.yaml`. It defines a deployment (`kind: Deployment`) for the `nginx` app, followed by a service definition with a type of LoadBalancer (`type: LoadBalancer`) that balances http traffic on port 80 for the `nginx` app.

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: my-nginx
  labels:
    app: nginx
spec:
  replicas: 3
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx:1.7.9
        ports:
        - containerPort: 80
---
apiVersion: v1
kind: Service
metadata:
  name: my-nginx-svc
```

```
  labels:
    app: nginx
spec:
  type: LoadBalancer
  ports:
  - port: 80
  selector:
    app: nginx
```

The first part of the configuration file defines an Nginx deployment, requesting that it be hosted on 3 pods running the nginx:1.7.9 image, and accept traffic to the containers on port 80.

The second part of the configuration file defines the Nginx service, which uses type LoadBalancer to balance Nginx traffic on port 80 amongst the available pods.

To create the deployment and service defined in `nginx_lb.yaml` while connected to your Kubernetes cluster, enter the command:

```
$ kubectl apply -f nginx_lb.yaml
```

This command outputs the following upon successful creation of the deployment and the load balancer:

```
deployment "my-nginx" created
service "my-nginx-svc" created
```

The load balancer may take a few minutes to go from a pending state to being fully operational. You can view the current state of your cluster by entering `kubectl get all`, where your output looks similar to the following:

```
$ kubectl get all

NAME                                READY     STATUS    RESTARTS   AGE
po/my-nginx-431080787-0m4m8         1/1       Running   0          3m
po/my-nginx-431080787-hqqcr         1/1       Running   0          3m
po/my-nginx-431080787-n8125         1/1       Running   0          3m

NAME               CLUSTER-IP      EXTERNAL-IP      PORT(S)         AGE
svc/kubernetes     203.0.113.1     <NONE>           443/TCP         3d
svc/my-nginx-svc   203.0.113.7     192.0.2.22       80:30269/TCP    3m

NAME                     DESIRED   CURRENT   UP-TO-DATE   AVAILABLE   AGE
```

```
deploy/my-nginx            3         3         3            3           3m

NAME                               DESIRED   CURRENT   READY     AGE
rs/my-nginx-431080787              3         3         3         3m
```

The output shows that the `my-nginx` deployment is running on 3 pods (the po/my-nginx entries), that the load balancer is running (svc/my-nginx-svc) and has an external IP (192.0.2.22) that clients can use to connect to the app that's deployed on the pods.

Creating Load Balancers with SSL Support to Distribute HTTPS Traffic

You can create a load balancer with SSL termination, allowing https traffic to an app to be distributed among the nodes in a cluster. This example provides a walkthrough of the configuration and creation of a load balancer with SSL support.

Consider the following configuration file, `nginx-demo-svc-ssl.yaml`, which defines an Nginx deployment and exposes it via a load balancer that serves http on port 80, and https on port 443. This sample creates an Oracle Cloud Infrastructure load balancer, by defining a service with a type of LoadBalancer (`type: LoadBalancer`).

```
apiVersion: apps/v1beta1
kind: Deployment
metadata:
  name: nginx-deployment
spec:
  replicas: 2
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx
        ports:
        - containerPort: 80
---
kind: Service
apiVersion: v1
metadata:
```

```
  name: nginx-service
  annotations:
    service.beta.kubernetes.io/oci-load-balancer-ssl-ports: "443"
    service.beta.kubernetes.io/oci-load-balancer-tls-secret: ssl-certificate-secret
spec:
  selector:
    app: nginx
  type: LoadBalancer
  ports:
  - name: http
    port: 80
    targetPort: 80
  - name: https
    port: 443
    targetPort: 80
```

The Load Balancer's annotations are of particular importance. The ports on which to support https traffic are defined by the value of **oci-load-balancer-ssl-ports**. You can declare multiple SSL ports by using a comma-separated list for the annotation's value. For example, you could set the annotation's value to "443, 3000" to support SSL on ports 443 and 3000.

The required TLS secret, **ssl-certificate-secret**, needs to be created in Kubernetes. This example creates and uses a self-signed certificate. However, in a production environment, the most common scenario is to use a public certificate that's been signed by a certificate authority.

The following command creates a self-signed certificate, `tls.crt`, with its corresponding key, `tls.key`:

```
$ openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout tls.key -out tls.crt -subj
"/CN=nginxsvc/O=nginxsvc"
```

Now that you created the certificate, you need to store both it and its key as a secret in Kubernetes. The name of the secret must match the name from the **oci-load-balancer-tls-secret** annotation of the load balancer's definition. Use the following command to create a TLS secret in Kubernetes, whose key and certificate values are set by `--key` and `--cert`, respectively.

```
$ kubectl create secret tls ssl-certificate-secret --key tls.key --cert tls.crt
```

You must create the Kubernetes secret before you can create the service, since the service references the secret in its definition. Create the service using the following command:

```
$ kubectl create -f manifests/demo/nginx-demo-svc-ssl.yaml
```

Watch the service and wait for a public IP address (EXTERNAL-IP) to be assigned to the Nginx service (nginx-service). This is the load balancer IP to use to connect to the service.

```
$ kubectl get svc --watch

NAME            CLUSTER-IP     EXTERNAL-IP      PORT(S)         AGE
nginx-service   192.0.2.1      198.51.100.1     80:30274/TCP    5m
```

The load balancer is now running, which means the service can now be accessed using either http or https, as demonstrated by the following commands:

```
$ curl http://198.51.100.1

$ curl --insecure https://198.51.100.1
```

The "`--insecure`" flag is used to access the service using https due to the use of self-signed certificates in this example. Do not use this flag in a production environment where the public certificate was signed by a certificate authority.

Note: When a cluster is deleted, a load balancer that's dynamically created when a service is created will not be removed. Before deleting a cluster, delete the service, which in turn will result in the cloud provider removing the load balancer. The syntax for this command is:

```
$ kubectl delete svc SERVICE_NAME
```

For example, to delete the service from the previous example, enter:

```
$ kubectl delete svc nginx-service
```

Creating Internal Load Balancers in Public and Private Subnets

When you create a 'custom' cluster, you select an existing VCN that contains the network resources to be used by the new cluster. If you want to use load balancers to control traffic into the VCN, you select existing public or private subnets in that VCN to host the load balancers.

When you create a 'quick cluster', the VCN that's automatically created contains public subnets to host load balancers. If you want to host load balancers in private subnets, you can add private subnets to the VCN later.

An internal load balancer restricts access to a cluster to only applications running in the same VCN as the cluster. You can host internal load balancers in public subnets and private subnets.

To enable a service to use an internal load balancer, include the following annotation in the configuration file:

```
service.beta.kubernetes.io/oci-load-balancer-internal: "true"
```

If you intend to host an internal load balancer in a private subnet, Oracle recommends you select the **Availability Domain-Specific** option when creating the private subnet. To enable a service to use the internal load balancer in that private subnet, include both the following annotations in the configuration file:

```
service.beta.kubernetes.io/oci-load-balancer-internal: "true"

service.beta.kubernetes.io/oci-load-balancer-subnet1: "ocid1.subnet.oc1..aaaaaa....vdfw"
```

where `ocid1.subnet.oc1..aaaaaa....vdfw` is the OCID of the private subnet you created.

For example:

```
apiVersion: v1
kind: Service
metadata:
  name: my-nginx-svc
  labels:
    app: nginx
  annotations:
    service.beta.kubernetes.io/oci-load-balancer-internal: "true"
    service.beta.kubernetes.io/oci-load-balancer-subnet1: "ocid1.subnet.oc1..aaaaaa....vdfw"
spec:
  type: LoadBalancer
  ports:
  - port: 8100
  selector:
    app: nginx
```

Specifying Alternative Load Balancer Shapes

The shape of an Oracle Cloud Infrastructure load balancer specifies its maximum total bandwidth (that is, ingress plus egress). By default, load balancers are created with a shape of 100Mbps. Other shapes are available, including 400Mbps and 8000Mbps. To specify an alternative shape for a load balancer, add an annotation in the metadata section of the manifest file.

For example:

```
apiVersion: v1
kind: Service
metadata:
  name: my-nginx-svc
  labels:
    app: nginx
  annotations:
    service.beta.kubernetes.io/oci-load-balancer-shape: 400Mbps
spec:
  type: LoadBalancer
  ports:
  - port: 80
  selector:
    app: nginx
```

Note: Sufficient load balancer quota must be available in the region for the shape you specify. Enter the following kubectl command to confirm that load balancer creation did not fail due to lack of quota:

```
$ kubectl describe service <service-name>
```

Creating a Persistent Volume Claim

Container storage via a container's root file system is ephemeral, and can disappear upon container deletion and creation. To provide a durable location to store data and prevent it from being lost, you can create and use persistent volumes to store data outside of containers.

You can define and apply a persistent volume claim to your cluster, which in turn creates a persistent volume that's bound to the claim. A claim is a block storage volume in the

underlying IaaS provider that's durable and offers persistent storage, enabling your data to remain intact, regardless of whether the containers that the storage is connected to are terminated.

With Oracle Cloud Infrastructure as the underlying IaaS provider, you can provision persistent volume claims by attaching volumes from the Block Storage service.

A persistent volume claim (PVC) is a request for storage, similar to how a pod requests compute resources. A PVC provides an abstraction layer to underlying storage. For example, an administrator could create a number of static persistent volumes (PVs) that can later be bound to one or more persistent volume claims. This is analogous to an administrator creating cluster nodes to which pods are later assigned. If none of the static persistent volumes match the user's PVC request, the cluster may attempt to dynamically create a PV that matches the PVC request. This example uses the latter approach, and it assumes that the cluster administrator has not created any suitable PVs that match the PVC request—meaning that the PVCs will dynamically create the PVs for this example.

The minimum amount of persistent storage that a PVC can request is 50 gigabytes. If the request is for less than 50 gigabytes, the request is rounded up to 50 gigabytes.

The following YAML defines two PVCs that each request 50 gigabytes of persistent storage (`storage: 50Gi`). You use names of the PVCs (for example, mysqlclaim) when defining which claims to use as the volumes of a deployment.

```
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
  name: mysqlclaim
spec:
  storageClassName: "oci"
  selector:
    matchLabels:
      failure-domain.beta.kubernetes.io/zone: "US-ASHBURN-AD-1"
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 50Gi
---
apiVersion: v1
```

```
kind: PersistentVolumeClaim
metadata:
  name: wordpressclaim
spec:
  storageClassName: "oci"
  selector:
    matchLabels:
      failure-domain.beta.kubernetes.io/zone: "US-ASHBURN-AD-2"
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 50Gi
```

Note

In the previous example, the PVCs request storage in availability domains in the Ashburn region using `matchLabels:failure-domain.beta.kubernetes.io/zone`. Note that when you specify values for `matchLabels:failure-domain.beta.kubernetes.io/zone`, you must use the shortened versions of availability domain names. For example `US-ASHBURN-AD-1`, `US-ASHBURN-AD-2`. See Availability by Region Name and Region Code for a list of shortened versions of availability domain names.

Enter the following command to create the PVC from the YAML file:

```
$ kubectl create -f https://raw.githubusercontent.com/wercker/oke_examples/master/kubernetes_
examples/persistent_volume_claims.yaml

persistentvolumeclaim "mysqlclaim" created
persistentvolumeclaim "wordpressclaim" created
```

You can verify that the PVCs have been created and bound to persistent volumes by calling `kubectl get pvc`:

```
$ kubectl get pvc

NAME             STATUS    VOLUME                                                                     CAPACITY
ACCESSMODES   STORAGECLASS   AGE
mysqlclaim       Bound     abyhqljrerxpanjto7b5zlxjesy4aedghc5c52f5v43xcrymo77ktdl6ibjq   50Gi       RWO
          oci            4m
wordpressclaim   Bound     abyhqljt3rzldcclootxn7yrfgv36s7rnggcobennjohevykqpitzkinspka   50Gi       RWO
          oci            4m
```

You can use these persistent volumes when creating other objects, such as deployments. For example, the following deployment definition instructs the system to use the mysqlclaim PVC as the mysql-persistent-storage volume, which is mounted by pods hosting the deployment as /var/lib/mysql.

```
#MySQL Deployment
apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  name: mysql
  labels:
    app: mysql
spec:
  replicas: 1
  selector:
    matchLabels:
      app: mysql
  template:
    metadata:
      labels:
        app: mysql
    spec:
      containers:
        - image: mysql:5.6
          name: mysql
          env:
            - name: MYSQL_ROOT_PASSWORD
              valueFrom:
                secretKeyRef:
                  name: mysql
```

```
                key: password
        ports:
          - containerPort: 3306
            name: mysql
        volumeMounts:
          - name: mysql-persistent-storage
            mountPath: /var/lib/mysql
    volumes:
      - name: mysql-persistent-storage
        persistentVolumeClaim:
          claimName: mysqlclaim
```

Adding OCI Service Broker for Kubernetes to Clusters

Service brokers offer a catalog of backing services to workloads running on cloud native platforms. The Open Service Broker API is a commonly-used standard for interactions between service brokers and platforms. The Open Service Broker API specification describes a simple set of API endpoints that platforms use to provision, gain access to, and manage service offerings. For more information about the Open Service Broker API, see resources available online including those at openservicebrokerapi.org.

OCI Service Broker for Kubernetes is an implementation of the Open Service Broker API. OCI Service Broker for Kubernetes is specifically for interacting with Oracle Cloud Infrastructure services from Kubernetes clusters. It includes three service broker adapters to bind to the following Oracle Cloud Infrastructure services:

- Object Storage
- Autonomous Transaction Processing
- Autonomous Data Warehouse

You can add OCI Service Broker for Kubernetes to clusters you've created with Oracle Cloud Infrastructure Container Engine for Kubernetes to interact with the Oracle Cloud Infrastructure services listed above. Having added OCI Service Broker for Kubernetes to a cluster, you don't have to manually provision and de-provision the Oracle Cloud Infrastructure services each time you deploy or un-deploy an application on the cluster. Instead, you interact with the Oracle Cloud Infrastructure services by using kubectl to call the Open Service Broker APIs implemented by OCI Service Broker for Kubernetes .

OCI Service Broker for Kubernetes is available as a Helm chart, a Docker container, and as source code from Github.

For more information about OCI Service Broker for Kubernetes, see the OCI Service Broker for Kubernetes documentation in the Github repository.

Adding OCI Service Broker for Kubernetes to a Cluster

To add OCI Service Broker for Kubernetes to a cluster, follow the detailed instructions in the Github repository.

For convenience, here's a high-level summary of the steps involved:

1. Install OCI Service Broker for Kubernetes. During this step, you will typically:
   - Install the Service Catalog.
   - Install the svcat tool.
   - Deploy OCI Service Broker for Kubernetes.
   - Grant RBAC permissions and roles.
   - Register OCI Service Broker for Kubernetes.

   For more information about installation, see the OCI Service Broker for Kubernetes documentation in the Github repository.
2. Secure OCI Service Broker for Kubernetes. During this step, you will typically:
   - Restrict access to Service Catalog resources using RBAC permissions and roles.
   - Configure TLS for OCI Service Broker for Kubernetes.
   - Set up an Oracle Cloud Infrastructure user for use by OCI Service Broker for Kubernetes.
   - Set up appropriate policies to control access to resources (according to the Oracle Cloud Infrastructure services to be used).
   - Limit access to the OCI Service Broker for Kubernetes endpoint using NetworkPolicy.

- Stand up an etcd cluster for Service Catalog and OCI Service Broker for Kubernetes.
- Protect sensitive values by creating secrets.

The security configuration to choose will depend on your particular requirements. For more information, see the OCI Service Broker for Kubernetes documentation in the Github repository.

3. Provision and bind to the required Oracle Cloud Infrastructure services. During this step, you will typically:
   - Provide service provision request parameters.
   - Provide service binding request parameters.
   - Provide service binding response credentials.

   The details to provide will depend on the Oracle Cloud Infrastructure service to bind to. For more information, see the OCI Service Broker for Kubernetes documentation in the Github repository.

Example: Setting Up an Ingress Controller on a Cluster

You can set up different open source ingress controllers on clusters you have created with Container Engine for Kubernetes.

This topic explains how to set up an example ingress controller along with corresponding access control on an existing cluster. Having set up the ingress controller, this topic describes how to use the ingress controller with an example hello-world backend, and how to verify the ingress controller is working as expected.

Example Components

The example includes an ingress controller and a hello-world backend.

Ingress Controller Components

The ingress controller comprises:

- An ingress controller deployment called `nginx-ingress-controller`. The deployment deploys an image that contains the binary for the ingress controller and Nginx. The binary manipulates and reloads the `/etc/nginx/nginx.conf` configuration file when an ingress is created in Kubernetes. Nginx upstreams point to services that match specified selectors.
- An ingress controller service called `ingress-nginx`. The service exposes the ingress controller deployment as a LoadBalancer type service. Because Container Engine for Kubernetes uses an Oracle Cloud Infrastructure integration/cloud-provider, a load balancer will be dynamically created with the correct nodes configured as a backend set.

Backend Components

The hello-world backend comprises:

- A backend deployment called `docker-hello-world`. The deployment handles default routes for health checks and 404 responses. This is done by using a stock hello-world image that serves the minimum required routes for a default backend.
- A backend service called `docker-hello-world-svc`.The service exposes the backend deployment for consumption by the ingress controller deployment.

Setting Up the Example Ingress Controller

In this section, you create the access rules for ingress. You then create the example ingress controller components, and confirm they are running.

Creating the Access Rules for the Ingress Controller

1. If you haven't already done so, download the cluster's kubeconfig configuration file and set the KUBECONFIG environment variable to point to the file. See Downloading a kubeconfig File to Enable Cluster Access.
2. In a terminal window, grant the Kubernetes RBAC cluster-admin clusterrole to the user by entering:

   ```
   $ kubectl create clusterrolebinding <my-cluster-admin-binding> --clusterrole=cluster-admin --
   user=<user_OCID>
   ```

   where:

   - `<my-cluster-admin-binding>` is a string of your choice to be used as the name for the binding between the user and the Kubernetes RBAC cluster-admin clusterrole. For example, `jdoe_clst_adm`
   - `<user_OCID>` is the user's OCID (obtained from the Console). For example, `ocid1.user.oc1..aaaaa...zutq` (abbreviated for readability).

   For example:

   ```
   $ kubectl create clusterrolebinding jdoe_clst_adm --clusterrole=cluster-admin --
   user=ocid1.user.oc1..aaaaa...zutq
   ```

Creating the Service Account, and the Ingress Controller

1. Run the following command to create the `nginx-ingress-controller` ingress controller deployment, along with the Kubernetes RBAC roles and bindings:

   ```
   $ kubectl apply -f https://raw.githubusercontent.com/kubernetes/ingress-
   nginx/master/deploy/mandatory.yaml
   ```

2. Create and save the file `cloud-generic.yaml` containing the following code to define the `ingress-nginx` ingress controller service as a load balancer service:

   ```
   kind: Service
   apiVersion: v1
   metadata:
     name: ingress-nginx
     namespace: ingress-nginx
     labels:
   ```

```
    app.kubernetes.io/name: ingress-nginx
    app.kubernetes.io/part-of: ingress-nginx
spec:
  type: LoadBalancer
  selector:
    app.kubernetes.io/name: ingress-nginx
    app.kubernetes.io/part-of: ingress-nginx
  ports:
    - name: http
      port: 80
      targetPort: http
    - name: https
      port: 443
      targetPort: https
```

3. Using the file you just saved, create the `ingress-nginx` ingress controller service by running the following command:

```
$ kubectl apply -f cloud-generic.yaml
```

Verifying the `ingress-nginx` Ingress Controller Service is Running as a Load Balancer Service

1. View the list of running services:

```
$ kubectl get svc -n ingress-nginx

NAME            TYPE           CLUSTER-IP     EXTERNAL-IP    PORT(S)                      AGE
ingress-nginx   LoadBalancer   10.96.229.38   <pending>      80:30756/TCP,443:30118/TCP   1h
```

   The EXTERNAL-IP for the `ingress-nginx` ingress controller service is shown as `<pending>` until the load balancer has been fully created in Oracle Cloud Infrastructure.

2. Repeat the `kubectl get svc` command until an EXTERNAL-IP is shown for the `ingress-nginx` ingress controller service:

```
$ kubectl get svc -n ingress-nginx

NAME            TYPE           CLUSTER-IP     EXTERNAL-IP       PORT(S)                      AGE
ingress-nginx   LoadBalancer   10.96.229.38   129.146.214.219   80:30756/TCP,443:30118/TCP   1h
```

Creating the TLS Secret

A TLS secret is used for SSL termination on the ingress controller. To generate the secret for this example, a self-signed certificate is used. While this is okay for testing, for production, use a certificate signed by a Certificate Authority.

```
$ openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout tls.key -out tls.crt -subj
"/CN=nginxsvc/O=nginxsvc"

$ kubectl create secret tls tls-secret --key tls.key --cert tls.crt
```

Note

Under Windows, you may need to replace `"/CN=nginxsvc/O=nginxsvc"` with `"//CN=nginxsvc\O=nginxsvc"` . For example, this is necessary if you run the `openssl` command from a Git Bash shell.

Setting Up the Example Backend

In this section, you define a hello-world backend service and deployment.

Creating the docker-hello-world Service Definition

1. Create the file `hello-world-ingress.yaml` containing the following code. This code uses a publicly available hello-world image from Docker Hub. You can substitute another image of your choice that can be run in a similar manner.

```
apiVersion: apps/v1beta1
kind: Deployment
metadata:
  name: docker-hello-world
  labels:
    app: docker-hello-world
```

```
spec:
  replicas: 3
  template:
    metadata:
      labels:
        app: docker-hello-world
    spec:
      containers:
      - name: docker-hello-world
        image: scottsbaldwin/docker-hello-world:latest
        ports:
        - containerPort: 80
---
apiVersion: v1
kind: Service
metadata:
  name: docker-hello-world-svc
spec:
  selector:
    app: docker-hello-world
  ports:
    - port: 8088
      targetPort: 80
  type: ClusterIP
```

Note the docker-hello-world service's type is ClusterIP, rather than LoadBalancer, because this service will be proxied by the `ingress-nginx` ingress controller service. The docker-hello-world service does not need public access directly to it. Instead, the public access will be routed from the load balancer to the ingress controller, and from the ingress controller to the upstream service.

2. Create the new hello-world deployment and service on nodes in the cluster by running the following command:

```
$ kubectl create -f hello-world-ingress.yaml
```

Using the Example Ingress Controller to Access the Example Backend

In this section you create an ingress to access the backend using the ingress controller.

Creating the Ingress Resource

1. Create the file `ingress.yaml` and populate it with this code:

```
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: hello-world-ing
  annotations:
    kubernetes.io/ingress.class: "nginx"
spec:
  tls:
  - secretName: tls-secret
  rules:
  - http:
      paths:
      - backend:
          serviceName: docker-hello-world-svc
          servicePort: 8088
```

2. Create the resource:

```
$ kubectl create -f ingress.yaml
```

Verifying that the Example Components are Working as Expected

In this section, you confirm that all of the example components have been successfully created and are operating as expected. The `docker-hello-world-svc` service should be running as a ClusterIP service, and the `ingress-nginx` service should be running as a LoadBalancer service. Requests sent to the ingress controller should be routed to nodes in the cluster.

Obtaining the External IP Address of the Load Balancer

To confirm the `ingress-nginx` service is running as a LoadBalancer service, obtain its external IP address:

```
$ kubectl get svc --all-namespaces

NAMESPACE       NAME                    TYPE           CLUSTER-IP      EXTERNAL-IP      PORT(S)
             AGE
```

```
default          docker-hello-world-svc   ClusterIP      10.96.83.247    <none>           8088/TCP
             16s
default          kubernetes               ClusterIP      10.96.0.1       <none>           443/TCP
             1h
ingress-nginx    ingress-nginx            LoadBalancer   10.96.229.38    129.146.214.219
80:30756/TCP,443:30118/TCP   5m
kube-system      kube-dns                 ClusterIP      10.96.5.5       <none>           53/UDP,53/TCP
             1h
kube-system      kubernetes-dashboard     ClusterIP      10.96.208.64    <none>           443/TCP
             1h
kube-system      tiller-deploy            ClusterIP      10.96.28.102    <none>           44134/TCP
             1h
```

Sending cURL Requests to the Load Balancer

1. Use the external IP address of the `ingress-nginx` service (for example, 129.146.214.219) to curl an http request:

   ```
   $ curl -I http://129.146.214.219

   HTTP/1.1 301 Moved Permanently
   Via: 1.1 10.68.69.10 (McAfee Web Gateway 7.6.2.10.0.23236)
   Date: Thu, 07 Sep 2017 15:20:16 GMT
   Server: nginx/1.13.2
   Location: https://129.146.214.219/
   Content-Type: text/html
   Content-Length: 185
   Proxy-Connection: Keep-Alive
   Strict-Transport-Security: max-age=15724800; includeSubDomains;
   ```

   The output shows a 301 redirect and a Location header that suggest that http traffic is being redirected to https.

2. Either cURL against the https url or add the `-L` option to automatically follow the location header. The `-k` option instructs cURL to not verify the SSL certificates.

   ```
   $ curl -ikL http://129.146.214.219

   HTTP/1.1 301 Moved Permanently
   Via: 1.1 10.68.69.10 (McAfee Web Gateway 7.6.2.10.0.23236)
   Date: Thu, 07 Sep 2017 15:22:29 GMT
   ```

```
Server: nginx/1.13.2
Location: https://129.146.214.219/
Content-Type: text/html
Content-Length: 185
Proxy-Connection: Keep-Alive
Strict-Transport-Security: max-age=15724800; includeSubDomains;

HTTP/1.0 200 Connection established

HTTP/1.1 200 OK
Server: nginx/1.13.2
Date: Thu, 07 Sep 2017 15:22:30 GMT
Content-Type: text/html
Content-Length: 71
Connection: keep-alive
Last-Modified: Thu, 07 Sep 2017 15:17:24 GMT
ETag: "59b16304-47"
Accept-Ranges: bytes
Strict-Transport-Security: max-age=15724800; includeSubDomains;

<h1>Hello webhook world from: docker-hello-world-1732906117-0ztkm</h1>
```

The last line of the output shows the HTML that is returned from the pod whose hostname is `docker-hello-world-1732906117-0ztkm`.

3. Issue the cURL request several times to see the hostname in the HTML output change, demonstrating that load balancing is occurring:

```
$ curl -k https://129.146.214.219

<h1>Hello webhook world from: docker-hello-world-1732906117-6115l</h1>

$ curl -k https://129.146.214.219

<h1>Hello webhook world from: docker-hello-world-1732906117-7r89v</h1>

$ curl -k https://129.146.214.219

<h1>Hello webhook world from: docker-hello-world-1732906117-0ztkm</h1>
```

Inspecting nginx.conf

The `nginx-ingress-controller` ingress controller deployment manipulates the `nginx.conf` file in the pod within which it is running.

1. Find the name of the pod running the `nginx-ingress-controller` ingress controller deployment and use it with a `kubectl exec` command to show the contents of `nginx.conf`.

```
$ kubectl get po -n ingress-nginx

NAME                                        READY     STATUS    RESTARTS   AGE
nginx-ingress-controller-110676328-h86xg   1/1       Running   0          1h

$ kubectl exec -n ingress-nginx -it nginx-ingress-controller-110676328-h86xg -- cat
/etc/nginx/nginx.conf
```

2. Look for `proxy_pass` in the output. There will be one for the default backend and another that looks similar to:

```
proxy_pass http://upstream_balancer;
```

   This shows that Nginx is proxying requests to an upstream called `upstream_balancer`.

3. Locate the upstream definition in the output. It will look similar to:

```
upstream upstream_balancer {
                server 0.0.0.1:1234; # placeholder

                balancer_by_lua_block {
                        tcp_udp_balancer.balance()
                }
        }
```

   The upstream is proxying via Lua.

CHAPTER 8 Data Transfer

This chapter explains how to migrate data to Oracle Cloud Infrastructure using Data Transfer Disk and Data Transfer Appliance.

Overview of Data Transfer Service

Oracle offers offline data transfer solutions that let you migrate data to Oracle Cloud Infrastructure. Moving data over the public internet is not always feasible due to high network costs, unreliable network connectivity, long transfer times, and security concerns. Our transfer solutions address these pain points, are easy to use, and provide significantly faster data upload compared to over-the-wire data transfer.

Data transfer is currently supported in us-ashburn-1, us-phoenix-1, eu-frankfurt-1, and uk-london-1 regions.

Note

To simplify this Data Transfer documentation, we generically refer to Object Storage to mean that you can transfer data into a bucket in either the Object Storage tier or Archive Storage tier.

DATA TRANSFER DISK

You send your data as files on encrypted commodity hard disk drives to an Oracle transfer site. Operators at the Oracle transfer site upload the files into your designated Object Storage bucket in your tenancy.

This transfer solution requires you to source and purchase the disks used to transfer data to Oracle Cloud Infrastructure. The disks are shipped back to you after the data is successfully uploaded.

See Data Transfer Disk for details.

DATA TRANSFER APPLIANCE

You send your data as files on secure, high-capacity, Oracle-supplied storage appliances to an Oracle transfer site. Operators at the Oracle transfer site upload the data into your designated Object Storage bucket in your tenancy.

This solution supports data transfer when you are migrating a large volume of data and when using disks is not a practical alternative. You do not need to write any code or purchase any hardware—Oracle supplies the transfer appliance and all of the software required to manage the transfer.

See Data Transfer Appliance for details.

Limits on Data Transfer Service Resources

When you sign up for Oracle Cloud Infrastructure, a set of service limits are configured for your tenancy. The service limit is the quota or allowance set on a resource. Limits for Data Transfer are initially set to zero. Verify that your service limits are set appropriately before you begin the data transfer process.

See Service Limits for a list of applicable limits and instructions for requesting a limit increase.

Data Transfer Disk

Data Transfer Disk is one of Oracle's offline data transfer solutions that lets you migrate data to Oracle Cloud Infrastructure. You send your data as files on encrypted disks to an Oracle transfer site. Operators at the Oracle transfer site upload the files into the designated Object Storage bucket in your tenancy. You are then free to move the uploaded data to other Oracle Cloud Infrastructure services as needed.

Data Transfer Disk Concepts

The following concepts are essential to understanding Data Transfer Service.

TRANSFER JOB

A transfer job is the logical representation of a data migration to Oracle Cloud Infrastructure. A transfer job consists of one or more transfer packages that each contain one or more transfer disks.

TRANSFER DISK

A transfer disk is an HDD that is specially prepared to copy and upload data to Oracle Cloud Infrastructure. You copy your data to one or more of these disks and ship the disks in a parcel to Oracle to upload your data.

The following transfer disks are supported:

- SATA II/III 2.5" or 3.5" HDDs
- External USB 2.0/3.0 HDDs

DATA TRANSFER UTILITY

The Data Transfer Utility is the command-line software that Oracle provides for you to prepare transfer disks for your data and for shipment to Oracle. In addition, you can use this software to manage transfer jobs and packages.

HOST

The computer at your site on which you download the Data Transfer Utility to perform Data Transfer Service tasks.

TRANSFER PACKAGE

A transfer package is the logical representation of the parcel containing the transfer disks that you ship to Oracle to upload to Oracle Cloud Infrastructure.

BUCKET

The logical container in Oracle Cloud Infrastructure Object Storage where Oracle operators upload your data. A bucket is associated with a single compartment in your

tenancy that has policies that determine what actions a user can perform on a bucket and on all the objects in the bucket.

DATA TRANSFER ADMINISTRATOR

A new or existing IAM user that has the authorization and permissions to create and manage transfer jobs. See Preparing for Data Transfer.

DATA TRANSFER UPLOAD USER

A temporary IAM user that grants Oracle personnel the authorization and permissions to upload the data from your transfer disks to your designated Oracle Cloud Infrastructure Object Storage bucket. Delete this temporary user after your data is uploaded to Oracle Cloud Infrastructure. See Preparing for Data Transfer.

Task Flow for Data Transfer Disk

Here is a high-level overview of the tasks involved in transferring data to Oracle Cloud Infrastructure using Data Transfer Disk.

Performing prerequisite tasks in preparation for transfer data

An Oracle Cloud Infrastructure administrator must perform prerequisite tasks in preparation for data transfer. These tasks are covered in greater detail in Preparing for Data Transfer.

1. Create or designate a bucket in your tenancy where Oracle is to upload your data.
2. Create or use an existing IAM group for data transfer administrators with the authorization and permissions to create and manage transfer jobs and manage objects in Oracle Cloud Infrastructure Object Storage.
3. Create or use an existing IAM data transfer administrator user and add that user to the data transfer administrators group.
4. Create or use an existing IAM group for data transfer upload users with the authorization and permissions to upload data to Oracle Cloud Infrastructure Object Storage.
5. Create a temporary IAM data transfer upload user and add that user to data transfer upload user group.

6. Write the authorization policies to allow the data transfer administrator and upload user groups to perform the required data transfer tasks.

Note

Important Security Consideration

For security reasons, we recommend that you create a unique IAM data transfer upload user for each transfer job and then delete that user after your data is uploaded to Oracle Cloud Infrastructure.

A data transfer administrator performs the remaining tasks. These tasks are covered in detail in Managing Disk Data Transfers.

Preparing for and copying your data

1. Create a transfer job.
2. Attach HDDs to your host machine.
3. Create transfer disks.
4. Copy your data to the transfer disks.

Finalizing the transfer disks in preparation for shipment

1. Generate a manifest for each transfer disk.
2. Generate the "dry run" report for each transfer disk
3. Lock each transfer disk.

Preparing and shipping the package

1. Create one or more transfer packages.
2. Attach the transfer disks to the transfer packages.
3. Get the shipping address for the transfer packages.

4. Package the transfer disks into a box, and ship the box to Oracle using an approved shipping vendor.
5. Update the transfer package with tracking information.

Secure Disk Data Transfer to Oracle Cloud Infrastructure

This section highlights the security details of the Data Transfer Service process.

- The Data Transfer Utility uses the standard Linux dm-crypt and LUKS utilities to encrypt block devices.
- The dm-crypt software generates a master AES-256 bit encryption key that is used for all data written to or read from the disk. That key is protected by an encryption passphrase that the user must know to access the encrypted data.
- When the data transfer administrator uses the Data Transfer Utility to create disks, Oracle Cloud Infrastructure creates a strong encryption passphrase that is displayed to the user and passed to dm-crypt. The passphrase is displayed to standard output only once and cannot be retrieved again. Copy this passphrase to a durable, secure location for future reference.
- For additional security, you can also encrypt your own data with you own encryption keys. Before copying your data to the transfer disk, you can encrypt your data with a tool and encryption key of your choosing. After the data has been uploaded, you would need to use the same tool and encryption key to access the data.
- All network communication between the Data Transfer Utility and Oracle Cloud Infrastructure is encrypted in-transit using Transport Layer Security (TLS).
- After copying your data to a transfer disk, generate a manifest file using the Data Transfer Utility. The manifest contains an index of all of the copied files and generated data integrity hashes. The Data Transfer Utility copies the `config_upload_user` configuration file and referenced IAM credentials to the encrypted transfer disk. This configuration file describes the temporary IAM data transfer upload user. Oracle uses the credentials and entries defined in the `config_upload_user` file when processing the transfer disk and uploading files to Oracle Cloud Infrastructure Object Storage.

Note

Data Transfer Service Does Not Support Passphrases on Private Keys

While we recommend encrypting a private key with a passphrase when generating API signing keys, Data Transfer does not support passphrases on the key file required for the `config_upload_user`. If you use a passphrase, Oracle personnel cannot upload your data.

Oracle cannot upload data from a transfer disk without the correct credentials defined in this configuration file. See Installing and Configuring the Data Transfer Utility for more information about the required configuration files.

- When you disconnect or lock a transfer disk using the Data Transfer Utility, the original encryption passphrase is required to once again access the disk. If the encryption passphrase is not known or lost, you cannot access the data on the transfer disk. To reuse a transfer disk, you must reformat the disk. Reformatting a disk removes all of the data.
- Oracle retrieves the encryption passphrase for a transfer disk from Oracle Cloud Infrastructure. Oracle uses the passphrase to decrypt, mount the transfer disk, and upload the data to the designated bucket in the tenancy.
- After processing a transfer package, Oracle returns all transfer disks attached to the transfer package using the return shipping label you provide.
- To protect your data, we make the data on the disk unrecoverable before shipping the transfer disks back to you. To comply with customs regulations, we wipe the disks completely before shipping the transfer disks back to international shipping addresses.

Ways to Manage Disk Data Transfers

We provide two ways to manage Data Transfer Services:

- The Data Transfer Utility is a full-featured command-line tool. For more information and installation instructions, see Installing and Configuring the Data Transfer Utility.
- The Console is an easy-to-use, partial-featured browser-based interface. For more information, see Signing In to the Console.

Note

You can perform many data transfer tasks using either the Console or the Data Transfer Utility. However, there are some tasks you can **only** perform using the Data Transfer Utility (for example, creating and locking transfer disks). Managing Disk Data Transfers describes the management tasks in detail and guides you to the appropriate management interface to use for each task.

Data Transfer Appliance

Data Transfer Appliance is one of Oracle's offline data transfer solutions that lets you migrate petabyte-scale datasets to Oracle Cloud Infrastructure. You send your data as files on one or more secure, high-capacity, Oracle-supplied storage appliances to an Oracle transfer site. Operators at the Oracle transfer site upload the files into the designated Object Storage bucket in your tenancy. You are then free to move the uploaded data to other Oracle Cloud Infrastructure services as needed.

Data Transfer Appliance Concepts

The following concepts are essential to understanding Data Transfer Appliance.

TRANSFER JOB

A transfer job is the logical representation of a data migration to Oracle Cloud Infrastructure. A transfer job is associated with one or more transfer appliances.

TRANSFER APPLIANCE

A transfer appliance is high storage capacity device that is specially prepared to copy and upload data to Oracle Cloud Infrastructure. You request a transfer appliance from Oracle, copy your data to the appliance, and then ship the appliance back to Oracle to upload your data.

DATA TRANSFER UTILITY

The Data Transfer Utility is the command-line software that Oracle provides for you to prepare transfer appliances for your data and for shipment to Oracle. In addition, you can use this software to manage transfer jobs and obtain status information about your appliances.

HOST

The computer at your site on which you download the Data Transfer Utility to perform Data Transfer Appliance tasks.

BUCKET

The logical container in Oracle Cloud Infrastructure Object Storage where Oracle operators upload your data. A bucket is associated with a single compartment in your tenancy that has policies that determine what actions a user can perform on a bucket and on all the objects in the bucket.

DATA TRANSFER ADMINISTRATOR

A new or existing IAM user that has the authorization and permissions to create and manage transfer jobs. See Preparing for Data Transfer.

DATA TRANSFER UPLOAD USER

A temporary IAM user that grants Oracle personnel the authorization and permissions to upload the data from your transfer devices to your designated Oracle Cloud Infrastructure Object Storage bucket. Delete this temporary user after your data is uploaded to Oracle Cloud Infrastructure. See Preparing for Data Transfer.

DATA TRANSFER APPLIANCE MANAGEMENT SERVICE

Software running on the transfer appliance that provides management functions. Users interact with this service though the Data Transfer Utility.

Transfer Appliance Specifications

You use NFSv3 to copy your data onto the Oracle data transfer appliance. Here are some details about the appliance:

Item Description	Specification
Storage Capacity	150 TB of protected usable space
Network Interfaces	- 10 GbE - RJ45 - 10 GbE - SFP+ You are responsible for providing all network cables. If you want to use SFP+, your transceivers must be compatible with Intel X520 NICs.
Provided Cables	- NEMA 5-15 type B to C13 - C13-14 power - USB-DB9 serial

Item Description	Specification
Environmental	- Operational temperature: 10–35°C - Operational relative humidity: 8–90% non-condensing - Acoustics: < 75 dB @ 23° C - Operational altitude: -300–3048 m (10,000 ft)
Power	- Consumption: 554 W - Voltage: 100–240 VAC - Frequency: 47–63 Hz - Conversion efficiency: 89%
Weight	- Unit: 38 lbs (17.2365 kg) - Unit + Transit Case: 64 lbs (29.0299 kg)
Height	3.5" (2U)
Width	17"
Depth	24"

Task Flow for Data Transfer Appliance

Here is a high-level overview of the tasks involved in transferring data to Oracle Cloud Infrastructure using Data Transfer Appliance.

Performing prerequisite tasks in preparation for data transfer

An Oracle Cloud Infrastructure administrator must perform prerequisite tasks in preparation for data transfer. These tasks and are covered in detail in Preparing for Data Transfer.

1. Create or designate a bucket in your tenancy where Oracle is to upload your data.
2. Create or use an existing IAM group for data transfer administrators with the authorization and permissions to create and manage transfer jobs and manage objects in Oracle Cloud Infrastructure Object Storage.
3. Create or use an existing IAM data transfer administrator user and add that user to the data transfer administrators group.
4. Create or use an existing IAM group for data transfer upload users with the authorization and permissions to upload data to Oracle Cloud Infrastructure Object Storage.
5. Create a temporary IAM data transfer upload user and add that user to data transfer upload user group.
6. Write the authorization policies to allow the data transfer administrator and upload user groups to perform the required data transfer tasks.

Note

Important Security Consideration

For security reasons, we recommend creating a unique IAM data transfer upload user for each transfer job and then deleting that user after your data is uploaded to Oracle Cloud Infrastructure.

A data transfer administrator performs the remaining tasks. These tasks are covered in detail in Managing Appliance Data Transfers.

Preparing for and copying your data

1. Create a transfer job.
2. Request a transfer appliance.
3. Monitor your transfer appliance request.
4. Set up your host machine.

5. Unpack and prepare your transfer appliance.
6. Configure networking on your transfer appliance.
7. Write data to your transfer appliance.

Preparing your appliances for shipment

1. Finalize your transfer appliance.
2. Package and ship the transfer appliance to Oracle.

Post shipment tasks

1. Optionally, cancel a transfer appliance if you don't want Oracle to upload your data.
2. Monitor your transfer appliance return shipment.
3. Review transfer appliance log files.
4. Close the transfer job.

Secure Appliance Data Transfer to Oracle Cloud Infrastructure

This section highlights the security details of the Data Transfer Appliance process.

- Appliances are shipped from Oracle to you with a tamper-evident security tie on the transit case. A second tamper-evident security tie is included in the appliance transit case for you to secure the case when you ship the case back to Oracle. The number on the physical security ties must match the numbers logged by Oracle in the transfer appliance details.
- When you configure the transfer appliance for the first time:
    - The transfer appliance generates a master AES-256 bit encryption key that is used for all data written to or read from the device. The encryption key never leaves the device.
    - The encryption key is protected by an encryption passphrase that you must know to access the encrypted data. The Data Transfer Utility securely fetches a provided encryption passphrase from Oracle Cloud Infrastructure and registers that passphrase on the transfer appliance.

- All data is encrypted as the data is copied to an Oracle transfer appliance.
- For additional security, you can also encrypt your own data with you own encryption keys. Before copying your data to the transfer appliance, you can encrypt your data with a tool and encryption key of your choosing. After the data has been uploaded, you would need to use the same tool and encryption key to access the data.
- All network communication between the Data Transfer Utility and Oracle Cloud Infrastructure is encrypted in-transit using Transport Layer Security (TLS).
- After copying your data to a transfer appliance, the Data Transfer Utility generates a manifest file. The manifest contains an index of all of the copied files and generated data integrity hashes. The Data Transfer Utility also encrypts and copies the `config_upload_user` configuration file to the transfer appliance. This configuration file describes the temporary IAM data transfer upload user. Oracle uses the credentials and entries defined in the `config_upload_user` file when processing the transfer appliance and uploading files to Oracle Cloud Infrastructure Object Storage.

  Note

  Data Transfer Service Does Not Support Passphrases on Private Keys

  While we recommend encrypting a private key with a passphrase when generating API signing keys, Data Transfer does not support passphrases on the key file required for the `config_upload_user`. If you use a passphrase, Oracle personnel cannot upload your data.

  Oracle cannot upload data from a transfer appliance without the correct credentials defined in this configuration file. See Installing and Configuring the Data Transfer Utility for more information about the required configuration files.
- Oracle erases all of your data from the transfer appliance after it has been processed. The erasure process follows the NIST 800-88 standards.

Ways to Manage Appliance Data Transfers

We provide two ways to manage data transfer appliances:

- The Data Transfer Utility is a full-featured command-line tool. For more information and installation instructions, see Installing and Configuring the Data Transfer Utility.
- The Console is an easy-to-use, partial-featured browser-based interface. For more information, see Signing In to the Console.

Note

You can perform many data transfer tasks using either the Console or the Data Transfer Utility. However, there are some tasks you can **only** perform using the Data Transfer Utility. Managing Appliance Data Transfers describes the management tasks in detail and guides you to the appropriate management interface to use for each task.

Preparing for Data Transfer

An Oracle Cloud Infrastructure administrator must perform prerequisite tasks in preparation for data transfer. If you are new to Oracle Cloud Infrastructure, we recommend that you read Setting Up Your Tenancy.

Creating the Required IAM Users, Groups, and Policies

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization.

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have

permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

Access to resources is provided to groups using policies and then inherited by the users that are assigned to those groups. Data transfer requires the creation of two distinct groups:

- Data transfer *administrators* who can create and manage transfer jobs.
- Data transfer *upload users* who can upload data to Object Storage. For your data security, the permissions for upload users allow Oracle personnel to upload standard and multi-part objects on your behalf and inspect bucket and object metadata. The permissions do not allow Oracle personnel to inspect the actual data.

For details on creating groups, see Managing Groups.

An administrator creates these groups with the following policies:

- The data transfer administrator group requires an authorization policy that includes the following:

```
Allow group <group_name> to manage data-transfer-jobs in compartment <compartment_name>
```

```
Allow group <group_name> to manage buckets in compartment <compartment_name>
```

```
Allow group <group_name> to manage objects in compartment <compartment_name>
```

  Alternatively, you can consolidate the `manage buckets` and `manage objects` policies into the following:

```
Allow group <group_name> to manage object-family in compartment <compartment_name>
```

- The data transfer upload user group requires an authorization policy that includes the following:

```
Allow group <group_name> to manage buckets in compartment <compartment_name> where all {
request.permission='BUCKET_READ' }
```

```
Allow group <group_name> to manage objects in compartment <compartment_name> where any {
request.permission='OBJECT_CREATE' , request.permission='OBJECT_OVERWRITE' ,
request.permission='OBJECT_INSPECT' }
```

Important

For security reasons, we recommend that you create a unique IAM data transfer upload user for each transfer job and then delete that user once your data is uploaded to Oracle Cloud Infrastructure.

The Oracle Cloud Infrastructure administrator then adds a user to each of the data transfer groups created. For details on creating users, see Managing Users.

Creating the Required Object Storage Bucket

The Object Storage service is used to upload your data to Oracle Cloud Infrastructure. Object Storage stores objects in a container called a bucket within a compartment in your tenancy. For details on creating the bucket to store uploaded data, see Managing Buckets.

What's Next

Installing the Data Transfer Utility

The Data Transfer Utility is a command-line utility that you install on your host machine. The utility lets you perform all data transfer-related task. This utility is required to perform certain data transfer tasks that cannot be performed using the Console. See Installing and Configuring the Data Transfer Utility for detailed installation and configuration instructions.

Performing Solution-Specific Tasks

After completing the prerequisite tasks, perform the data transfer-related tasks related to the transfer solution you are using:

- If you are using disks to transfer data, see Managing Disk Data Transfers.
- If you are using appliances to transfer data, see Managing Appliance Data Transfers.

Installing and Configuring the Data Transfer Utility

This topic describes how to install and configure the Data Transfer Utility. In addition, this topic describes the syntax for the Data Transfer Utility commands.

- **Services supported:**
  - Data Transfer Disk
  - Data Transfer Appliance
- **Downloading:**
  - Download the .deb file to install on Debian or Ubuntu
  - Download the .rpm file to install on Oracle Linux or Red Hat Linux

Prerequisites

To install and use the Data Transfer Utility, you need the following:

- An Oracle Cloud Infrastructure account.
- Required Oracle Cloud Infrastructure users and groups with the required IAM policies. See Preparing for Data Transfer for details.
- A host machine with the following installed:
  - Oracle Linux 6 or greater, Ubuntu 14.04 or greater, or SUSE 11 or greater
  - Java 1.8 or Java 1.11
  - hdparm 9.0 or later
- For HDD data transfers, the host machine needs the following:
  - Cryptsetup 1.2.0 or greater
- For appliance data transfers, the host machine needs the following:
  - Serial console terminal emulator software. We recommend using the following terminal emulator software:

        - PuTTY for Windows
        - ZOC for OS X
        - PuTTY or Minicom for Linux
    - Terminal emulator software settings as follows:
        - Baud Rate: 115200
        - Emulation: VT102
        - Handshaking: Disabled/off
        - RTS/DTS: Disabled/off
    - The host set up as an NFS client:
        - For Debian or Ubuntu, install the `nfs-common` package.
        - For Oracle Linux or Red Hat Linux, install the `nfs-utils` package.

You might need to set up an HTTP proxy environment to access to the public Internet for the Data Transfer Utility to communicate with the Data Transfer Appliance Management Service and to the transfer appliance over a local network connection. If your environment requires Internet-aware applications to use network proxies, configure the Data Transfer Utility to use your environment's network proxies by setting the standard Linux environment variables on your host machine.

Assume that your organization has a corporate Internet proxy at `http://www-proxy.myorg.com` and that the proxy is an HTTP address at port `80`. You would set the following environment variable:

```
export HTTPS_PROXY=http://www-proxy.myorg.com:80
```

If you configured a proxy on the host machine and the transfer appliance is directly connected to that host, the host machine tries unsuccessfully to communicate with the transfer appliance using a proxy. You must set a `no_proxy` environment variable for the transfer appliance. For example, if the appliance is on a local network at `10.0.0.1`, you would set the following environment variable:

```
export NO_PROXY=10.0.0.1
```

Installing the Data Transfer Utility

Download and install the Data Transfer Utility installer that corresponds to your host machine's operating system.

To install the Data Transfer Utility on Debian or Ubuntu

1. If you have not done so already, download the .deb file.
2. Issue the `apt install` command as the `root` user that has write permissions to the `/opt` directory.

   ```
   sudo apt install ./dts-X.Y.Z.x86_64.deb
   ```

   `X.Y.Z` represents the version numbers that match the installer you downloaded.
3. Confirm that the Data Transfer Utility installed successfully.

   ```
   sudo dts --help
   ```

To install the Data Transfer Utility on Oracle Linux or Red Hat Linux

1. If you have not done so already, download the .rpm file.
2. Issue the `yum install` command as the `root` user that has write permissions to the `/opt` directory.

   ```
   sudo yum localinstall ./dts-X.Y.Z.x86_64.rpm
   ```

   `X.Y.Z` represents the version numbers that match the installer you downloaded.
3. Confirm that the Data Transfer Utility installed successfully.

   ```
   sudo dts --help
   ```

Configuring the Data Transfer Utility

Before using the Data Transfer Utility, you must create a base Oracle Cloud Infrastructure directory and two configuration files with the required credentials. One configuration file is for the data transfer administrator, the IAM user with the authorization and permissions to create

and manage transfer jobs. The other configuration file is for the data transfer upload user, the temporary IAM user that Oracle uses to upload your data on your behalf.

Base Data Transfer Directory

Create a base Oracle Cloud Infrastructure directory:

```
mkdir /root/.oci/
```

Configuration File for the Data Transfer Administrator

Create a data transfer administrator configuration file `/root/.oci/config` with the following structure:

```
[DEFAULT]
user=<The OCID for the data transfer administrator>
fingerprint=<The fingerprint of the above user's public key>
key_file=<The _absolute_ path to the above user's private key file on the host machine>
tenancy=<The OCID for the tenancy that owns the data transfer job and bucket>
region=<The region where the transfer job and bucket should exist. Valid values are:
us-ashburn-1, us-phoenix-1, eu-frankfurt-1, and uk-london-1.>
```

For example:

```
[DEFAULT]
user=ocid1.user.oc1..<unique_ID>
fingerprint=4c:1a:6f:a1:5b:9e:58:45:f7:53:43:1f:51:0f:d8:45
key_file=/home/user/ocid1.user.oc1..<unique_ID>.pem
tenancy=ocid1.tenancy.oc1..<unique_ID>
region=us-phoenix-1
```

For the data transfer administrator, you can create a single configuration file that contains different profile sections with the credentials for multiple users. Then use the `--profile` option to specify which profile to use in the command. Here is an example of a data transfer administrator configuration file with different profile sections:

```
[DEFAULT]
user=ocid1.user.oc1..<unique_ID>
fingerprint=4c:1a:6f:a1:5b:9e:58:45:f7:53:43:1f:51:0f:d8:45
key_file=/home/user/ocid1.user.oc1..<unique_ID>.pem
tenancy=ocid1.tenancy.oc1..<unique_ID>
region=us-phoenix-1
[PROFILE1]
```

```
user=ocid1.user.oc1..<unique_ID>
fingerprint=4c:1a:6f:a1:5b:9e:58:45:f7:53:43:1f:51:0f:d8:45
key_file=/home/user/ocid1.user.oc1..<unique_ID>.pem
tenancy=ocid1.tenancy.oc1..<unique_ID>
region=us-ashburn-1
```

Important

Creating an upload user configuration file with multiple profiles is *not* supported.

By default, the `DEFAULT` profile is used for all Data Transfer Utility commands. For example:

```
dts job create --compartment-id <compartment_id> --bucket <bucket_name> --display-name <display_name> --
device-type <disk_or_appliance>
```

Instead, you can issue any Data Transfer Utility command with the `--profile` option to specify a different data transfer administrator profile. For example:

```
dts job create --compartment-id <compartment_id> --bucket <bucket_name> --display-name <display_name> --
device-type <disk_or_appliance> --profile <profile_name>
```

Using the example configuration file above, the *<profile_name>* would be `profile1`.

Configuration File for the Data Transfer Upload User

Create a data transfer upload user `/root/.oci/config_upload_user` configuration file with the following structure:

```
[DEFAULT]
user=<The OCID for the data transfer upload user>
fingerprint=<The fingerprint of the above user's public key>
key_file=<The _absolute_ path to the above user's private key file on the host machine>
tenancy=<The OCID for the tenancy that owns the data transfer job and bucket>
region=<The region where the transfer job and bucket should exist. Valid values are:
us-ashburn-1, us-phoenix-1, eu-frankfurt-1, and uk-london-1.>
```

For example:

```
[DEFAULT]
user=ocid1.user.oc1..<unique_ID>
fingerprint=4c:1a:6f:a1:5b:9e:58:45:f7:53:43:1f:51:0f:d8:45
```

```
key_file=/home/user/ocid1.user.oc1..<unique_ID>.pem
tenancy=ocid1.tenancy.oc1..<unique_ID>
region=us-phoenix-1
```

Configuration File Entries

The following table lists the basic entries that are required for each configuration file and where to get the information for each entry.

Note

Data Transfer Service Does Not Support Passphrases on Private Keys

While we recommend encrypting a private key with a passphrase when generating API signing keys, Data Transfer service does not support passphrases on the key file required for the config_upload_user. If you use a passphrase, Oracle personnel cannot upload your data.

Entry	Description and Where to Get the Value	Required?
`user`	OCID of the data transfer administrator or the data transfer upload user, depending on which profile you are creating. To get the value, see Required Keys and OCIDs.	Yes
`fingerprint`	Fingerprint for the key pair being used. To get the value, see Required Keys and OCIDs.	Yes

Entry	Description and Where to Get the Value	Required?
`key_file`	Full path and filename of the private key. **Important:** The key pair must be in PEM format. For instructions on generating a key pair in PEM format, see Required Keys and OCIDs.	Yes
`tenancy`	OCID of your tenancy. To get the value, see Required Keys and OCIDs.	Yes
`region`	An Oracle Cloud Infrastructure region. See Regions and Availability Domains. Data transfer is currently supported in `us-ashburn-1`, `us-phoenix-1`, `eu-frankfurt-1`, and `uk-london-1`.	Yes

You can verify the data transfer upload user credentials using the following command:

```
dts job verify-upload-user-credentials --bucket <bucket_name>
```

Configuration File Location

The location of the configuration files is `/root/.oci/config`.

Using the Data Transfer Utility

This section provides an overview of the syntax for the Data Transfer Utility.

Important

The Data Transfer Utility must be run as the `root` user.

There are two ways you can specify Data Transfer Utility command options:

`--option <value>`

Or

`--option=<value>`

Syntax

The basic Data Transfer Utility syntax is:

```
dts <resource> <action> <options>
```

This syntax is applied, as follows:

- `dts` is the shortened utility command name
- `job` is an example of a `<resource>`
- `create` is an example of an `<action>`, and
- other utility strings are `<options>`.

The following commands to create a transfer job shows a typical Data Transfer Utility construct.

```
dts job create --compartment-id ocid1.compartment.oc1..<unique_ID> --display-name "mycompany transfer1"
--bucket mybucket --device-type appliance
```

Or:

```
dts job create --compartment-id=ocid1.compartment.oc1..<unique_ID> --display-name="mycompany transfer1"
--bucket=mybucket --device-type=appliance
```

Note

In the previous examples, provide a friendly name for the transfer job using the `--display-name` option. Avoid entering confidential information when providing resource names or descriptions.

Getting Help with Commands

You can get help using `--help`, `-h`, or `-?`. For example:

```
dts --help
```

Finding Out the Installed Version of the Data Transfer Utility

You can get the installed version of the Data Transfer Utility using `--version` or `-v`. For example:

```
dts --version
```

What's Next

You are now ready to perform data transfer-related tasks.

- For task documentation related to HDD data transfers, see Managing Disk Data Transfers.
- For task documentation related to appliance data transfers, see Managing Appliance Data Transfers.

Managing Disk Data Transfers

This topic describes in detail all the tasks required to transfer data to Oracle Cloud Infrastructure using the Data Transfer Disk service.

In preparation for data migration, an IAM user that has administrative authorization and permissions must perform the prerequisite tasks described in Preparing for Data Transfer.

The Data Transfer Utility is a command-line utility that you install on your host machine. Many data transfer tasks can be performed either using the Console or using the Data Transfer Utility. However, some data transfer tasks can only be performed using the Data Transfer Utility. This section guides you to the appropriate management interface to use for each task. See Installing and Configuring the Data Transfer Utility for detailed installation and configuration instructions.

Important

The Data Transfer Utility must be run as the `root` user.

There are two ways you can specify Data Transfer Utility parameters:

`--parameter <value>`

or

`--parameter=<value>`

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Data Transfer currently supports applying tags to transfer jobs using the Data Transfer Utility. Tagging is not supported using the Console.

Creating a Transfer Job

Tip

You can use the Console or the Data Transfer Utility to create a transfer job.

A transfer job represents the collection of files that you want to transfer and signals the intention to upload those files to Oracle Cloud Infrastructure. A transfer job combines at least one transfer disk with a transfer package. Identify which compartment and Object Storage bucket that Oracle is to upload your data to. Create the transfer job in the same compartment as the upload bucket and supply a human-readable name for the transfer job. Avoid entering confidential information when providing transfer job names.

Creating a transfer job returns a job ID that you specify in other transfer tasks. For example:

```
ocid1.datatransferjob.region1.phx..<unique_ID>
```

To create a transfer job using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Select the designated compartment you are to use for data transfers from the drop-down list.
   A list of transfer jobs that have already been created is displayed.
3. Click **Create Transfer Job**.
4. In the **Create Transfer Job** dialog, enter a **Job Name**, and select the **Upload Bucket** from the drop-down list.
   Avoid entering confidential information in the transfer job name.
5. Select **Disk** for the **Transfer Device Type**.
6. Click **Create Transfer Job**.

To create a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job create` to create a transfer job. The *<display_name>* is the name of the transfer job. Avoid entering confidential information in the transfer job name.

```
dts job create --bucket <bucket_name> --compartment-id <compartment_id> --display-name <display_name>
--device-type disk
```

Optionally, you can specify one or more free-form or defined tags when you create a transfer job. For more information about tagging, see Resource Tags.

To specify free-form tags when creating a job:

```
dts job create --bucket <bucket_name> --compartment-id <compartment_id> --display-name <display_name>
--device-type disk --freeform-tags '{ "<tag_key>":"<value>" }'
```

To specify defined tags when creating a job:

```
dts job create --bucket <bucket_name> --compartment-id <compartment_id> --display-name <display_name>
--device-type disk --defined-tags '{ "<tag_namespace>": { "<tag_key>":"<value>" }}'
```

Note

Tag namespaces and tag keys are created by a user with the required permissions and must already exist before you can specify them when creating a job. See Working with Defined Tags for details.

To specify multiple tags, comma separate the json-formatted additional key/value pairs:

```
dts job create --bucket <bucket_name> --compartment-id <compartment_id> --display-name <display_name>
--device-type disk --freeform-tags '{ "<tag_key>":"<value>" }', '{ "<tag_key>":"<value>" }'
```

Performing Other Transfer Job Tasks

Tip

You can use the Console or the Data Transfer Utility to perform other transfer job-related tasks.

Displaying the List of Transfer Jobs

To display the list of transfer jobs using the Console

Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.

To display the list of transfer jobs using the Data Transfer Utility

At the command prompt on the host, run `dts job list` to display the list of transfer jobs.

```
dts job list --compartment-id <compartment_id>
```

When you use the Data Transfer Utility to list jobs, tagging details are also included in the output if you specified tags.

Displaying the Details of a Transfer Job

To display the details of a transfer job using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the transfer job for which you want to display the details.
3. Click the Actions icon (three dots), and then click **View Details**.

To display the details of a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job show` to display the details of a transfer job.

```
dts job show --job-id <job_id>
```

When you use the Data Transfer Utility to display the details of a job, tagging details are also included in the output if you specified tags.

Editing the Name of a Transfer Job

To edit the name of a transfer job using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the data transfer job that you want to edit.
3. Click the Actions icon (three dots), and then click **Edit**.
4. Edit the name of the transfer job.
   Avoid entering confidential information in the transfer job name.
5. Click **Save**.

To edit the name of a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job update` to edit the name (`--display-name`) of a transfer job. The *<display_name>* is the new name of the transfer job. Avoid entering confidential information in the transfer job name.

```
dts job update --job-id <job_id> --display-name <display_name>
```

To edit the tags associated with a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job update` to edit the tags associated with a transfer job. The Data Transfer Utility **replaces** any existing tags with the new key/value pairs you specify.

To edit free-form tags, provide the replacement key/value pairs:

```
dts job update --job-id <job_id> --freeform-tags '{ "<tag_key>":"<value>" }'
```

To edit defined tags, provide the replacement key value pairs:

```
dts job update --job-id <job_id> --defined-tags '{ "<tag_namespace>": { "<tag_key>":"<value>" }}'
```

To delete the tags associated with a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job update` to delete the tags associated with a transfer job. The Data Transfer Utility **replaces** any existing tags with the new key/value pairs you specify. If you want to delete some of the tags, you would specify new tag string that does not contain the key/value pair you want to delete.

Partial tag deletion is handled in the same way as you editi tags:

- To edit free-form tags, provide the replacement key/value pairs:

```
dts job update --job-id <job_id> --freeform-tags '{ "<tag_key>":"<value>" }'
```

- To edit defined tags, provide the replacement key value pairs:

```
dts job update --job-id <job_id> --defined-tags '{ "<tag_namespace>": { "<tag_key>":"<value>" }}'
```

To delete all free-form tags:

```
dts job update --job-id <job_id> --freeform-tags '{}'
```

To delete all defined tags:

```
dts job update --job-id <job_id> --defined-tags '{}'
```

Deleting a Transfer Job

Typically, you would delete a transfer job early in the transfer process and before you create any transfer packages or disks. For example, you initiated the data transfer by creating a transfer job, but changed your mind. If you want to delete a transfer job later in the transfer process, you must first delete all transfer packages and disks associated with the transfer job.

To delete a transfer job using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the data transfer job that you want to delete.
3. Click the Actions icon (three dots), and then click **Delete**.
   Alternatively, you can delete a transfer job from the **View Details** page.
4. Confirm the deletion when prompted.

To delete a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job delete` to delete a transfer job.

```
dts job delete --job-id <job_id>
```

Attaching HDDs to the Host Machine

Before creating a transfer disk from an attached HDD, remove all partitions and any file systems. To prevent the accidental deletion of data, the Data Transfer Utility doesn't work with HDDs that already have partitions or file systems. HDDs are visible to the host as block devices and must provide a valid response to the `hdparm -I <device>` Linux command.

Creating a Transfer Disk

Tip

You can only use the Data Transfer Utility to create a transfer disk.

When you create a transfer disk, the Data Transfer Utility:

- Sets up the HDD for encryption using the passphrase
- Creates a file system on the HDD
- Mounts the file system at `/mnt/orcdts_<label>`

For example:

```
/mnt/orcdts_DJZNWK3ET
```

When you register a transfer disk, Oracle Cloud Infrastructure generates a strong encryption passphrase that is used to encrypt the transfer disk. The encryption passphrase is displayed to standard output to the data transfer administrator user and cannot be retrieved again. Create a local, secure copy of the encryption passphrase, so you can reference the passphrase again.

Creating a transfer disk requires the job ID returned from when you created the transfer job and the path to the attached HDD (for example, `/dev/sdb`).

To create a transfer disk using the Data Transfer Utility

At the command prompt on the host, run `dts disk create` to create a transfer disk.

```
dts disk create --job-id <job_id> --block-device <block_device>
```

Performing Other Transfer Disk Tasks

Tip

You can only use the Data Transfer Utility to delete or cancel a transfer disk.

Deleting a Transfer Disk

Typically, you would delete a transfer disk during the disk preparation process. You created, attached, and/or copied data to the transfer disk, but have changed your mind about shipping the disk. If you want to reuse the disk, remove all file systems and create the disk again.

To delete a transfer disk using the Data Transfer Utility

At the command prompt on the host, run `dts disk delete` to delete a transfer disk.

```
dts disk delete --job-id <job_id> --disk-label <label>
```

Canceling a Transfer Disk

If you shipped a disk to Oracle, but have changed your mind about uploading the files, you can cancel the transfer disk. You can cancel a disk in a transfer package, while allowing the file upload from other disks.

Oracle cannot process canceled transfer disks. Oracle returns canceled transfer disks to the sender.

To cancel a transfer disk using the Data Transfer Utility

At the command prompt on the host, run `dts disk cancel` to cancel a transfer disk.

```
dts disk cancel --job-id <job_id> --disk-label <label>
```

Copying Data to the Transfer Disk

Attach the HDDs to the host machine and copy files to the mount point created by the Data Transfer Utility.

You can only copy regular files to transfer disks. Special files (links, sockets, pipes, and so forth) cannot be copied directly. To transfer special files, create a tar archive of the files and copy the tar archive to the transfer disk.

Note

Copy all Files Before Disconnecting a Transfer Disk

Do not disconnect a transfer disk until you copy all files from the host and generate the manifest file. If you accidentally disconnect the transfer disk before copying all files, you must unlock the disk using the encryption passphrase. The encryption passphrase was generated and displayed when you created the transfer disk. If the generated encryption passphrase is not available, you must delete the transfer disk from the transfer job and re-create the disk. All data previously copied to that transfer disk is lost.

Generating a Manifest File

Tip

You can only use the Data Transfer Utility to generate a manifest file.
The amount of time to generate the manifest file depends on the size of the upload files, disk speed, and available processing power.

After copying your data to a transfer disk, generate a manifest file using the Data Transfer Utility. The manifest contains an index of all of the copied files and generated data integrity hashes. The Data Transfer Utility copies the `config_upload_user` configuration file and referenced IAM credentials to the encrypted transfer disk. This configuration file describes the temporary IAM data transfer upload user. Oracle uses the credentials and entries defined in the `config_upload_user` file when processing the transfer disk and uploading files to Oracle Cloud Infrastructure Object Storage.

Note

Data Transfer Service Does Not Support Passphrases on Private Keys

While we recommend encrypting a private key with a passphrase when generating API signing keys, Data Transfer does not support passphrases on the key file required for the `config_upload_user`. If you use a passphrase, Oracle personnel cannot upload your data.

Oracle cannot upload data from a transfer disk without the correct credentials defined in this configuration file. See Installing and Configuring the Data Transfer Utility for more information about the required configuration files.

To create a manifest file using the Data Transfer Utility

At the command prompt on the host, run `dts disk manifest` to create a manifest file.

```
dts disk manifest --job-id <job_id> --disk-label <label>
```

Note

Do You Need to Regenerate the Manifest File?

If you add, remove, or modify any files on the disk after generating the manifest file, you must regenerate the file. If the manifest file does not match the contents of the target bucket, Oracle cannot upload the data.

Generating a Dry-Run Report of the Transfer

Tip

You can only use the Data Transfer Utility to generate a dry-run report.

You can generate a dry-run report to review the transfer results before the actual data upload. The report compares the contents of the generated manifest file with the contents of the target bucket. This report can help determine if you have duplicate files or naming collision issues.

Note

Do You Need to Regenerate the Manifest File?

If you add, remove, or modify any files on the disk after generating the manifest file, you must regenerate the file. If the manifest file does not match the contents of the target bucket, Oracle cannot upload the data.

To generate a dry-run report

At the command prompt on the host, run `dts disk dry-run` to generate a dry-run report of the transfer disk.

```
dts disk dry-run --job-id <job_id> --disk-label <label>
```

Locking a Transfer Disk

Tip

You can only use the Data Transfer Utility to lock a transfer disk.

Locking a transfer disk safely unmounts the disk and removes the encryption passphrase from the host. When you lock a transfer disk, you are prompted for the encryption passphrase that was generated when you created the transfer disk.

To lock a transfer disk using the Data Transfer Utility

At the command prompt on the host, run `dts disk lock` to lock a transfer disk.

```
dts disk lock --job-id <job_id> --disk-label <label> --block-device <block_device>
```

If you need to unlock the transfer disk, you are prompted for the encryption passphrase that was generated when you created the transfer disk.

To unlock a transfer disk using the Data Transfer Utility

At the command prompt on the host, run `dts disk unlock` to unlock a transfer disk.

```
dts disk unlock --job-id <job_id> --disk-label <label> --block-device <block_device> --encryption-passphrase <encryption_passphrase>
```

Creating a Transfer Package

Tip

You can use the Console or the Data Transfer Utility to create a transfer package.

A transfer package is the virtual representation of the physical package of disks that you are shipping to Oracle for upload to Oracle Cloud Infrastructure.

Creating a transfer package requires the job ID returned from when you created the transfer job. For example:

```
ocid1.datatransferjob.region1.phx..exampleuniqueID
```

To create a transfer package using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the transfer job for which you want to create a transfer package.
3. Click the Actions icon (three dots), and then click **View Details**.
   Alternatively, click the hyper-linked name of the transfer job.
   A list of transfer packages that have already been created is displayed.

4. Click **Create Transfer Package**.
5. In the **Create Transfer Package** dialog, choose the **Vendor**.
6. Click **Create Transfer Package**.

To create a transfer package using the Data Transfer Utility

At the command prompt on the host, run `dts package create` to create a transfer package.

```
dts package create --job-id <job_id>
```

Performing Other Transfer Package Tasks

Tip

You can use the Console or the Data Transfer Utility to perform other transfer package-related tasks.

Displaying the Details of a Transfer Package

To display the details of a transfer package using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the transfer job for which you want to see the details.
3. Click the Actions icon (three dots), and then click **View Details**.
   Alternatively, click the hyper-linked name of the transfer job.
   A list of transfer packages that have already been created is displayed.

To display the details of a transfer package using the Data Transfer Utility

At the command prompt on the host, run `dts package show` to display the details of a transfer package.

```
dts package show --job-id <job_id> --package-label <package_label>
```

Editing a Transfer Package

Edit the transfer package and supply the tracking information when you ship the package.

To edit a transfer package using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the transfer job for which you want to see the associated transfer packages.
3. Click the Actions icon (three dots), and then click **View Details**.
4. Find the transfer package that you want to edit.
5. Click the Actions icon (three dots), and then click **View Details**.
6. Click **Edit**.
   Change the vendor and supply the tracking information as needed.
7. Click **Edit Transfer Package**.

To edit a transfer package using the Data Transfer Utility

At the command prompt on the host, run `dts package update` to edit the details of a transfer package.

```
dts package update --job-id <job_id> --package-label <package_label> [--package-vendor <vendor_name>]
[--tracking-number <tracking_number>] [--return-tracking-number <return_tracking_number>]
```

Deleting a Transfer Package

Typically, you would delete a transfer package early in the transfer process and before you created any transfer disks. You initiated the transfer job and package, but have changed your mind. If you delete a transfer package later in the transfer process, you must first detach all associated transfer disks. You cannot delete a transfer package once the package has been shipped to Oracle.

To delete a transfer package using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the transfer job for which you want to see the associated transfer packages.
3. Click the Actions icon (three dots), and then click **View Details**.
4. Find the transfer package that you want to edit.
5. Click the Actions icon (three dots), and then click **View Details**.
6. Click **Edit**.
   Change the vendor and supply the tracking information as needed.
7. Click **Edit Transfer Package**.

To delete a transfer package using the Data Transfer Utility

At the command prompt on the host, run `dts package delete` to delete a transfer package.

```
dts package delete --job-id <job_id> --package-label <package_label>
```

Canceling a Transfer Package

If you shipped a transfer package, but have changed your mind about uploading the data, you can cancel a transfer package. Before canceling a transfer package, you must first cancel all transfer disks associated with that transfer package. Oracle cannot process canceled transfer packages. Oracle returns canceled transfer packages to the sender.

To cancel a transfer package using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the transfer job for which you want to see associated transfer packages.
3. Click the Actions icon (three dots), and then click **View Details**.
4. Find the transfer package that you want to cancel.
5. Click the Actions icon (three dots), and then click **View Details**.
6. Click **Cancel Transfer Package**.

To cancel a transfer package using the Data Transfer Utility

At the command prompt on the host, run `dts package cancel` to cancel a transfer package.

```
dts package cancel --job-id <job_id> --package-label <package_label>
```

Attaching Transfer Disks to a Transfer Package

Tip

You can use the Console or the Data Transfer Utility to attach a transfer disk to a transfer package.

You attach a transfer disk to a transfer package after you have copied your data onto the disk, generated the required manifest file, run and reviewed the dry-run report, and then locked the transfer disk in preparation for shipment.

A disk can be attached to one package, detached, and then attached to another package.

To attach a transfer disk to a transfer package using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the transfer job associated with the transfer package that you want to attach a disk to.
3. Click the Actions icon (three dots), and then click **View Details**.
   A list of transfer packages is displayed.
4. Find the transfer package that you want to attach a disk to.
5. Click the Actions icon (three dots), and then click **View Details**.
   Alternatively, click the hyper-linked name of the transfer package.
   A list of transfer disks is displayed.
6. Click **Attach Transfer Disks**.
7. In the **Attach Transfer Disk** dialog, select the **Transfer Disks** that you want to attach to the transfer package.
8. Click **Attach**.

To attach a transfer disk to a transfer package using the Data Transfer Utility

At the command prompt on the host, run `dts disk attach` to attach a disk to a transfer package.

```
dts disk attach --job-id <job_id> --package-label <package_label> --disk-label <label>
```

You have attached a transfer disk to a transfer package, but have changed your mind about shipping that disk with the transfer package. You can also detach a transfer disk from one transfer package and attach that disk to a different transfer package.

To detach a transfer disk to a transfer package using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and

click **Data Transfer**.

2. Find the transfer package for which you want to detach a transfer disk.
3. Click the Actions icon (three dots), and then click **View Details**.
   Alternatively, click the hyper-linked name of the transfer package.
   A list of transfer disks that have already been attached is displayed.
4. Find the transfer disk that you want to detach.
5. Click the Actions icon (three dots), and then click **View Details**.
   Alternatively, click the hyper-linked name of the transfer disk.
6. Click **Detach Transfer Disk**.

To detach a transfer disk to a transfer package using the Data Transfer Utility

At the command prompt on the host, run `dts disk attach` to attach a disk to a transfer package.

```
dts disk attach --job-id <job_id> --package-label <package_label> --disk-label <label>
```

Getting the Shipping Address for the Transfer Package

Tip

You can use the Console or the Data Transfer Utility to get the shipping address for a transfer package.

You can find the shipping address in the transfer package details.

To get the shipping address for a transfer package using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.

2. Find the transfer job for which you want to see the details.
3. Click the Actions icon (three dots), and then click **View Details**.
   Alternatively, click the hyper-linked name of the transfer job.
   A list of transfer packages that have already been created is displayed.
4. Find the transfer package for which you want to see the details.
5. Click the Actions icon (three dots), and then click **View Details**.
   Alternatively, click the hyper-linked name of the transfer job.

To get the shipping address for a transfer package using the Data Transfer Utility

At the command prompt on the host, run `dts package show` to get the shipping address for a transfer package.

```
dts package show --job-id <job_id> --package-label <package_label>
```

Important

Be sure to update the transfer package with tracking information to avoid processing delays! See Updating the Transfer Package With Tracking Information for details.

Packaging and Shipping Transfer Disks

General

Include the required return shipping label in the box when packaging transfer disks for shipment.

Note

Return Shipment Label Requirement

If you do not include the return shipping label inside the box, Oracle cannot process the transfer package.

Ensure that the transfer job and transfer package label are clearly readable on the outside of the box containing the transfer disks.

Important

If you are shipping transfer disks to `eu-frankfurt-1`, you must request that the shipping vendor requires a signature for delivery to ensure that the package is correctly delivered to Oracle.

Shipping Transfer Disks Internationally

You need to create a commercial invoice when shipping transfer disks internationally. To ensure that packages are not held up in customs, follow these guidelines when creating the commercial invoice:

- Show a unique reference number.
- Show the "bill-to party as follows:
  - For shipments to the European Union (Frankfurt) location:
    ORACLE Deutschland B.V. & Co. KG
    Riesstrasse 25
    Munich, 80992
    GERMANY
  - For shipments to the United States location:

Oracle America, Inc.
500 Oracle Parkway
REDWOOD CITY CA 94065
UNITED STATES

- Show the "ship-to party" as the address provided in the transfer package details. See Getting the Shipping Address for the Transfer Package for details.
- State that "The value shown includes the value of software and data recorded onto the hard drive unit."
- State that the "Goods are free of charge - no payment required."
- State that the type of export is "Temporary."
- Ensure that the commodity code shows the correct HS code for a hard drive unit as specified in the source country's HS code list.
- State the description as the manufacture's description of the hard drive unit and include the words "Hard Disk Drive."
- Ensure the invoice is signed and includes the printed name of the signer.

Updating the Transfer Package With Tracking Information

Tip

You can use the Console or the Data Transfer Utility to update the transfer package with tracking information.

After delivering the transfer package to the shipping vendor, update the transfer package with the tracking information.

Important

Oracle cannot process a transfer package until you update the tracking information.

To update the transfer package with tracking information using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the transfer job for which you want to see the associated transfer packages.
3. Click the Actions icon (three dots), and then click **View Details**.
   A list of transfer packages that have already been created is displayed.
4. Find the transfer package that you want to update.
5. Click the Actions icon (three dots), and then click **View Details**.
6. Click **Edit**.
7. Enter the **Tracking ID** and the **Return Tracking ID**.
8. Click **Edit Transfer Package**.

To update the transfer package with tracking information using the Data Transfer Utility

At the command prompt on the host, run `dts package ship` to update the transfer package tracking information.

```
dts package ship --job-id <job_id> --package-label <package_label> --package-vendor <vendor_name> --
tracking-number <tracking_number> --return-tracking-number <return_tracking_number>
```

Checking the Transfer Package Status

Tip

You can use the Console or the Data Transfer Utility to check the status of a transfer package.

When Oracle has processed the transfer disks associated with a transfer package, the status of the transfer package changes to **Processed**. When Oracle has shipped the transfer disks associated with a transfer package, the status of the transfer package changes to **Returned**.

To check the status of a transfer package using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Choose the data transfer package for which you want to display the details.
3. Click the Actions icon (three dots), and then click **View Details**.
4. Look at the **Status**.

To check the status of a transfer package using the Data Transfer Utility

At the command prompt on the host, run `dts package show` to show the status of a transfer package.

```
dts package show --job-id <job_id> --package-label <package_label>
```

Reviewing the Log Files for Each Transfer Disk

Oracle creates log files for each transfer disk uploaded. The logs are placed in the bucket where the transfer disk data was uploaded. The log file compares the transfer disk's manifest file to the contents of the target Oracle Cloud Infrastructure Object Storage bucket after file upload.

The top of the log report summarizes the overall file processing status:

```
P - Present: The file is present in both the disk and the target bucket
M - Missing: The file is present in the disk but not the target bucket. It was likely uploaded and then
deleted by another user before the summary was generated.
C - Name Collision: The file is present in the manifest but a file with the same name but different
contents is present in the target bucket.
U - Unreadable: The file is not readable from the disk
N - Name Too Long: The file name on disk is too long and could not be uploaded
```

Complete file upload details follow the summary.

```
#########################################################################################################################

```

Closing a Transfer Job

Tip

You can use the Console or the Data Transfer Utility to close a transfer job.

Typically, you would close a transfer job when no further transfer job activity is required or possible. Closing a transfer job requires that the status of all associated transfer packages be returned, canceled, or deleted. In addition, the status of all associated transfer disks must be complete, in error, missing, canceled, or deleted.

To close a transfer job using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and

click **Data Transfer**.

2. Find the data transfer package for which you want to display the details.
3. Click the Actions icon (three dots), and then click **View Details**. Alternatively, click the hyper-linked name of the transfer job.
4. Click **Close Transfer Job**.

To close a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job close` to close a transfer job.

```
dts job close --job-id <job_id>
```

Managing Appliance Data Transfers

This topic describes in detail all the tasks required to transfer data to Oracle Cloud Infrastructure using the Data Transfer Appliance service.

In preparation for data migration, an IAM user that has administrative authorization and permissions must perform the prerequisite tasks described in Preparing for Data Transfer.

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Data Transfer currently supports applying tags to transfer jobs using the Data Transfer Utility. Tagging is not supported using the Console.

Preparing Your Host Machine

The Data Transfer Utility is a command-line utility that you install on a computer (host machine) at your site. Many data transfer tasks can be performed either using the Console or

using the Data Transfer Utility. However, some data transfer tasks can only be performed using the Data Transfer Utility. Each topic in this section guides you to the appropriate management interface to use for each task.

The host machine also requires terminal emulator software to access the transfer appliance serial console.

Step 1: Download and install the Data Transfer Utility on the host computer

Download and install the Data Transfer Utility on your host computer. See Installing and Configuring the Data Transfer Utility for detailed installation and configuration instructions.

Important

The Data Transfer Utility must be run as the `root` user.

Step 2: Configure the Data Transfer Utility to Use the Required Local Utilities

To export the paths for the required local utilities

At the command prompt on the host, use the `export` command to set the paths to the required utilities.

```
export OPENSSL_PATH="</path/to/binary>" # This is the full path to the openssl binary. Usually it can be found by `which openssl`

export KEYTOOL_PATH="</path/to/binary>" # This is the full path to the Java keytool binary. Usually it can be found by `which keytool`

export KEYSTORE_PATH="</path/to/binary>" # This is the full path to the Java CA certificate store (cacerts). Usually it can be found by `$(readlink /usr/bin/java | sed "s:bin/java::")lib/security/cacerts`
```

Step 3: Install and configure terminal emulator software on the host computer

Terminal emulator software provides access to the transfer appliance serial console. We recommend using the following terminal emulator software:

- PuTTY for Windows
- ZOC for OS X
- PuTTY or Minicom for Linux

Configure the terminal emulator software settings as follows:

- Baud Rate: 115200
- Emulation: VT102
- Handshaking: Disabled/off
- RTS/DTS: Disabled/off

Creating a Transfer Job

Tip

You can use the Console or the Data Transfer Utility to create a transfer job.

A transfer job represents the collection of files that you want to transfer and signals the intention to upload those files to Oracle Cloud Infrastructure. Identify which compartment and Object Storage bucket that Oracle is to upload your data to. Create the transfer job in the same compartment as the upload bucket and supply a friendly name for the transfer job. Avoid entering confidential information when providing transfer job names.

Creating a transfer job returns a job ID that you specify in other transfer tasks. For example:

```
ocid1.datatransferjob.region1.phx..<unique_ID>
```

To create a transfer job using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.

2. Select the designated compartment you are to use for data transfers from the drop-down list.
   A list of transfer jobs that have already been created is displayed.
3. Click **Create Transfer Job**.
4. In the **Create Transfer Job** dialog, enter a friendly **Job Name**, and select the **Upload Bucket** from the drop-down list.
   Avoid entering confidential information in the job name.
5. Select **Appliance** for the **Transfer Device Type**.
6. Click **Create Transfer Job**.

To create a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job create` to create a transfer job. The *<display_name>* is the name of the transfer job. Avoid entering confidential information in the transfer job name.

```
dts job create --bucket <bucket_name> --compartment-id <compartment_id> --display-name <display_name>
--device-type appliance
```

Optionally, you can specify one or more free-form or defined tags when you create a transfer job. For more information about tagging, see Resource Tags.

To specify free-form tags when creating a job:

```
dts job create --bucket <bucket_name> --compartment-id <compartment_id> --display-name <display_name>
--device-type appliance --freeform-tags '{ "<tag_key>":"<value>" }'
```

To specify defined tags when creating a job:

```
dts job create --bucket <bucket_name> --compartment-id <compartment_id> --display-name <display_name>
--device-type appliance --defined-tags '{ "<tag_namespace>": { "<tag_key>":"<value>" }}'
```

Note

Tag namespaces and tag keys are created by a user with the required permissions and must already exist before you can specify them when creating a job. See Working with Defined Tags for details.

To specify multiple tags, comma separate the json-formatted additional key/value pairs:

```
dts job create --bucket <bucket_name> --compartment-id <compartment_id> --display-name <display_name>
--device-type appliance --freeform-tags '{ "<tag_key>":"<value>" }', '{ "<tag_key>":"<value>" }'
```

Performing Other Transfer Job Tasks

Tip

You can use the Console or the Data Transfer Utility to perform other transfer job-related tasks.

Displaying the List of Transfer Jobs

To display the list of transfer jobs using the Console

Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.

To display the list of transfer jobs using the Data Transfer Utility

At the command prompt on the host, run `dts job list` to display the list of transfer jobs.

```
dts job list --compartment-id <compartment_id>
```

When you use the Data Transfer Utility to list jobs, tagging details are also included in the output if you specified tags.

Displaying the Details of a Transfer Job

To display the details of a transfer job using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the transfer job for which you want to display the details.
3. Click the Actions icon (three dots), and then click **View Details**.

To display the details of a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job show` to display the details of a transfer job.

```
dts job show --job-id <job_id>
```

When you use the Data Transfer Utility to display the details of a job, tagging details are also included in the output if you specified tags.

Editing the name of a Transfer Job

To edit the name of a transfer job using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.

2. Find the data transfer job that you want to edit.
3. Click the Actions icon (three dots), and then click **Edit**.
4. Edit the name of the transfer job.
   Avoid entering confidential information in the transfer job name.
5. Click **Save**.

To edit the name of a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job update` to edit the name (`--display-name`) of a transfer job. The *<display_name>* is the new name of the transfer job. Avoid entering confidential information in the transfer job name.

```
dts job update --job-id <job_id> --display-name <display_name>
```

To edit the tags associated with a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job update` to edit the tags associated with a transfer job. The Data Transfer Utility **replaces** any existing tags with the new key/value pairs you specify.

To edit free-form tags, provide the replacement key/value pairs:

```
dts job update --job-id <job_id> --freeform-tags '{ "<tag_key>":"<value>" }'
```

To edit defined tags, provide the replacement key value pairs:

```
dts job update --job-id <job_id> --defined-tags '{ "<tag_namespace>": { "<tag_key>":"<value>" }}'
```

To delete the tags associated with a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job update` to delete the tags associated with a transfer job. The Data Transfer Utility **replaces** any existing tags with the new key/value pairs you specify. If you want to delete some of the tags, you would specify new tag string that does not contain the key/value pair you want to delete.

Partial tag deletion is handled in the same way as you editi tags:

- To edit free-form tags, provide the replacement key/value pairs:

```
dts job update --job-id <job_id> --freeform-tags '{ "<tag_key>":"<value>" }'
```

- To edit defined tags, provide the replacement key value pairs:

```
dts job update --job-id <job_id> --defined-tags '{ "<tag_namespace>": { "<tag_key>":"<value>" }}'
```

To delete all free-form tags:

```
dts job update --job-id <job_id> --freeform-tags '{}'
```

To delete all defined tags:

```
dts job update --job-id <job_id> --defined-tags '{}'
```

Deleting a Transfer Job

You can only delete a transfer job early in the transfer process. For example, you initiated the data transfer by creating a transfer job, but changed your mind. If you want to delete a transfer job after you requested transfer appliances, you must first delete those appliance requests.

To delete a transfer job using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the data transfer job that you want to delete.

3. Click the Actions icon (three dots), and then click **Delete**.
   Alternatively, you can delete a transfer job from the **View Details** page.
4. Confirm the deletion when prompted.

To delete a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job delete` to delete a transfer job.

```
dts job delete --job-id <job_id>
```

Requesting a Transfer Appliance

Tip

You can use the Console or the Data Transfer Utility to request a transfer appliance.

Oracle Cloud Infrastructure customers can use data transfer appliances to migrate data for free. You are only charged for Object Storage usage once the data is successfully transferred to your designated bucket. All appliance requests still require approval from Oracle.

Tip

We recommend that you identify the data you intend to upload and make data copy preparations before requesting the transfer appliance.

Creating a transfer appliance request returns an Oracle-assigned appliance label. For example:

```
XA8XM27EVH
```

To request a transfer appliance using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
   Choose the transfer job that you want to request a transfer appliance for.
2. Under **Transfer Appliances**, click **Request Transfer Appliance**.
3. In the **Request Transfer Appliance** dialog box, provide the shipping address details where you want the appliance sent.
   - **Company Name:** Required. Specify the name of the company that owns the data being migrated to Oracle Cloud Infrastructure.
   - **Recipient Name:** Required. Specify the name of the recipient to send the appliance to.
   - **Recipient Phone Number:** Required. Specify the recipient's phone number.
   - **Recipient Email Address:** Required. Specify the recipient's email address.
   - **Care Of:** Optional intermediary party responsible for transferring the appliance shipment from the delivery vendor to the intended recipient.
   - **Address Line 1:** Required. Specify the street address to send the appliance to.
   - **Address Line 2:** Optional identifying address details like building, suite, unit, or floor information.
   - **City/Locality:** Required. Specify the city or locality.
   - **State/Province/Region:** Required. Specify the state, province, or region.
   - **Zip/Postal Code:** Specify the zip code or postal code.
   - **Country:** Required. Select the country.
4. Click **Request Transfer Appliance**.

To request a transfer appliance using the Data Transfer Utility

At the command prompt on the host, run `dts appliance request` to request a data transfer appliance.

Here are the minimum requirements for the transfer appliance request:

```
dts appliance request --job-id <job_id> --addressee <addressee> --address1 <address_line1> --city-or-
locality <city_or_locality> --state-or-region <state_or_region> --country <country> --zip-code <zip>
```

In addition, you can specify these optional fields in the request:

```
--care-of <care_of>
--address2 <address_line2>, --address3 <address_line3>, and --address4 <address_line4>
--email <email_address>
--phone-number <phone_number>
--profile <profile>
```

When you submit an appliance request, Oracle generates a unique label (name) to identify the transfer appliance and your request is sent to Oracle for approval and processing.

Monitoring the Status of Your Request for a Transfer Appliance

The time it takes to approve, prepare, and ship your transfer appliance request varies and depends on various factors, including current available inventory. Oracle provides status updates daily throughout the transfer appliance request and ship process.

To monitor the status of your transfer appliance request using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find and select the transfer job for which you want to monitor associated appliance requests.
3. Under **Transfer Appliances**, find the appliance label Oracle assigned to your data transfer appliance request and look at the **Status** field.

Here are the key status values to look for when monitoring your transfer appliance request:

- **Requested**: You successfully completed your request for a transfer appliance. The status displays **Requested** until Oracle approves your transfer appliance request.
- **Rejected**: Oracle denied your transfer appliance request.

> **Important**
>
> If your appliance request is denied and you have questions, contact your Sales Representative or file a Service Request (SR).

- **Oracle Preparing**: Oracle approved your transfer appliance request. The status displays **Oracle Preparing** until the transfer appliance is shipped to you.
- **Shipping**: Oracle completed the necessary preparations and shipped your transfer appliance. When the appliance is shipped, Oracle provides the serial number of the appliance, the shipping vendor, and the tracking number in the **Transfer Appliance Details**. The status displays **Shipping** until the appliance is delivered to you.
- **Delivered**: The shipping vendor delivered your transfer appliance. When the appliance is delivered, Oracle provides the date and time the appliance was received in the **Transfer Appliance Details**. The status displays **Delivered**.

To monitor the status of your transfer appliance request using the Data Transfer Utility

At the command prompt on the host, run `dts appliance show` to monitor your transfer appliance request.

```
dts appliance show --job-id <job_id> --appliance-label <label>
```

See Data Transfer Appliance Statuses for an explanation of all transfer appliance statuses.

Performing Other Transfer Appliance Tasks

Tip

You can use the Console or the Data Transfer Utility to perform other transfer appliance-related tasks.

Displaying the Details of a Transfer Appliance

To display the details of a transfer appliance using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the transfer job for which you want to display the details of an associated transfer appliance.
   The list of transfer appliances is displayed below the transfer job details.
3. Find the transfer appliance for which you want to display the details.
4. Click the Actions icon (three dots), and then click **View Details**.

To display the details of a transfer appliance using the Data Transfer Utility

At the command prompt on the host, run `dts appliance show` to display the details of a transfer appliance.

```
dts appliance show --job-id <job_id> --appliance-label <label>
```

Editing the Appliance Request Shipping Information

You can only edit the shipping information when the status is **Requested**.

To edit the appliance request shipping information using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the **Requested** transfer appliance that you want to edit the shipping information.
3. Click the Actions icon (three dots), and then click **Edit**.
4. Edit the shipping information for the transfer appliance.
5. Click **Save**.

To edit the appliance request shipping information using the Data Transfer Utility

At the command prompt on the host, run `dts appliance update` to edit the shipping information for the transfer appliance.

```
dts appliance update-shipping-address --job-id <job_id> --appliance-label <label> <changed_fields>
```

The *<changed_fields>* variable represents one or more of the following shipping address fields that you want to update:

```
--addressee <addressee> --careOf <care_of> --address1 <street_address> --city <city> --state
<addressee> --zip <zip> --country <country> --phone <phone>
```

Deleting a Transfer Appliance Request

You can delete a transfer appliance request before Oracle approves the request—the status must be **Requested**. For example, you initiated the transfer by creating a transfer job and requested a transfer appliance, but changed your mind.

To delete a transfer appliance request using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the data transfer job and transfer appliance request that you want to delete.

3. Click the Actions icon (three dots), and then click **Delete**.
   Alternatively, you can delete a transfer appliance request from the **Transfer Appliance Details** page.
4. Confirm the deletion when prompted.

To delete a transfer appliance request using the Data Transfer Utility

At the command prompt on the host, run `dts appliance delete` to delete a transfer appliance.

```
dts appliance delete --job-id <job_id> --appliance-label <label>
```

Unpacking and Preparing Your Transfer Appliance

When the shipping vendor delivers your transfer appliance, Oracle updates the status as **Delivered** and provides the date and time the appliance was received in the **Transfer Appliance Details**.

Important

Your transfer appliance arrives in a transit case with a telescoping handle and wheels. The case amenities allow for easy movement to the location where you intend to place the appliance to upload your data.

Retain all packaging materials! When shipping the transfer appliance back to Oracle, you must package the appliance in the same manner and packaging in which the appliance was received.

Here are the tasks involved in unpacking and getting your transfer appliance ready to configure.

1. Inspect the tamper-evident security tie on the transit case.
   If the appliance was tampered with during transit, the tamper-evident security tie serves to alert you.

   Warning

   If the security tie is damaged or is missing, do not plug the appliance into your network! Immediately file a Service Request (SR).

2. Remove and compare the number on the security tie with the number logged by Oracle.

To see the security tie number logged by Oracle using the Console

a. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
b. Find the transfer job and transfer appliance associated with the removed security tie.
c. Click the **Actions** icon (•••), and then click **View Details**.
d. Look at the contents of the **Send Security Tie ID** field in the **Transfer Appliance Details** and compare that number with the number on the physical tag.

To see the security tie number logged by Oracle using the Data Transfer Utility

At the command prompt on the host, run `dts appliance show` to delete a transfer appliance.

```
dts appliance show --job-id <job_id> --appliance-label <label>
```

Warning

If the number on the physical security tie does not match the number logged by Oracle, do not plug the appliance into your network! Immediately file a Service Request (SR).

3. Open the transit case and ensure that the case contains the following items:
    - Appliance unit and power cable (two types of power cables provided: C14 and C13 to 14)
    - USB to DB-9 serial cable
    - Return shipping instructions (retain these instructions)
    - Return shipping label, label sleeve, tie-on tag, and zip tie
    - Return shipment tamper-evident security tie (use this tie to ensure secure transit case back to Oracle)
4. Compare the number on the return shipment security tie with the number logged by Oracle.

To see the security tie number logged by Oracle using the Console

a. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.

b. Find the transfer job and transfer appliance associated with the return shipment security tie.

c. Click the Actions icon (three dots), and then click **View Details**.

d. Look at the contents of the **Return Security Tie ID** field in the **Transfer Appliance Details** and compare that number with the number on the physical tag.

To see the security tie number logged by Oracle using the Data Transfer Utility

At the command prompt on the host, run `dts appliance show` to the security tie number associated with the transfer appliance.

```
dts appliance show --job-id <job_id> --appliance-label <label>
```

Warning

If the number on the return security tie does not match the number logged by Oracle, file a Service Request (SR). These security tie numbers must match or Oracle cannot upload data from your returned transfer appliance.

5. Remove the transfer appliance from the case and place the appliance on a solid surface or in a rack.

Warning

We recommend assistance lifting the transfer appliance out of the transit case and placing the appliance in a rack or on a desk top. The total shipping weight is about 64 lbs (29.0299 kg) and appliance weight is 38 lbs (17.2365 kg).

6. Connect the appliance to your local network using one of the following:
   - 10GBase-T: Standard RJ-45
   - SFP+: The transceiver must be compatible with Intel X520 NICs.

7. Attach one of the provided power cords to the appliance and plug the other end into a grounded power source.
8. Turn on the appliance by flipping the power switch on the back of the appliance.
9. Connect the appliance to your host computer using the provided USB to DB-9 serial cable.

Note

You might need to download the driver for this cable on your host computer: https://www.cablestogo.com/product/26887/5ft-usb-to-db9-male-serial-rs232-adapter-cable#support

Configuring Your Transfer Appliance Networking

When the appliance boots up, an appliance serial console configuration menu is displayed on the terminal emulator on the host machine. It can take up to 5 minutes for the serial console menu to display.

The transfer appliance supports a single active network interface on any of the 10-Gbps network ports. If only one interface is cabled and active, that interface is chosen automatically. If multiple interfaces are active, you are given the choice to select the interface to use.

To configure your transfer appliance networking

1. Using the terminal emulator on the host machine, select **Configure Networking** from the appliance serial console menu.

2. Provide the required networking information when prompted:
   - **IP Address:** IP address of the transfer appliance.
   - **Subnet Mask Length:** The count of leading 1 bits in the subnet mask. For example, if the subnet mask is 255.255.255.0 then the length is 24.
   - **Default Gateway:** Default gateway for network communications.

   For example:

```
Configure Networking:
^C to cancel

Configuring IP address, subnet mask length, gateway
Example:
IP Address : 10.0.0.2
Subnet Mask Length : 24
Gateway : 10.0.0.1
Subnet mask length 24 <=> 255.255.255.0IP

Address: 10.0.0.1
Subnet Mask Length: 24
Gateway: 10.0.0.1

Configuring IP address 10.0.0.1 netmask 255.255.255.0 default gateway 10.0.0.1
Enabling enp0s3
Now trying to restart the network

Network configuration is complete

New authentication material created.

Client access token                  : 4iH1gw1okPJO
Appliance certificate MD5 fingerprint : BF:C6:49:9B:25:FE:9F:64:06:7E:DF:F5:F9:E5:C6:56
Press ENTER to return...
```

When you configure a network interface, the appliance software generates a new client access token and appliance X.509/SSL certificate. The access token is used to authorize your host machine to communicate with the Data Transfer Appliance's Management Service. The x.509/SSL certificate is used to encrypt communications with the Data Transfer Appliance's Management Service over the network. You will need provide the access token and SSL

certificate fingerprint values displayed here when you use the Data Transfer Utility to initialize authentication on your host machine.

You can change the selected interface, network information, and reset the authentication material at any time by selecting **Configure Networking** again from the appliance serial console menu.

Setting Up Your Host Machine

This topic describes the tasks required to set up your host machine to communicate with the transfer appliance using the Data Transfer Appliance Management Service. This Management Service controls all functional aspects of the transfer appliance.

Tip

You can only use the Data Transfer Utility to set up your host machine.

Step 1: Initializing Authentication

Initialize authentication to allow the host machine to communicate with the data transfer appliance. Use the values returned from the **Configure Networking** command. See Configuring Your Transfer Appliance Networking for details.

To initialize authentication

At the command prompt on the host, run `dts physical-appliance initialize-authentication` to initialize authentication.

```
dts physical-appliance initialize-authentication --appliance-cert-fingerprint="<fingerprint>" --
appliance-ip="<ip_address>"
```

For example:

```
dts physical-appliance initialize-authentication --appliance-cert-
fingerprint="F7:1B:D0:45:DA:04:0C:07:1E:B2:23:82:E1:CA:1A:E9" --appliance-ip="10.0.0.1"
```

When prompted, supply the access token and system Java keystore password. The appliance access token is stored in the Data Transfer Utility configuration and the x.509/SSL certificate is stored in the system Java keystore. Ask your administrator or vendor what the password is for your system Java keystore. For example:

```
Access token ('q' to quit): p5jZuonkmYsz1mhI
The X.509/SSL certificate for the appliance must be added to the local Java Keystore.
Continue? [y/n] y
Java Keystore password ('q' to quit): <keystore_password>
Running Java keytool to delete any appliance certificate from the keystore ...
Running Java keytool to add appliance certificate to the keystore ...
Appliance certificate added.
```

The host machine can now communicate with the transfer appliance.

To show the status of and storage details about the connected appliance

At the command prompt on the host, run `dts physical-appliance show` to show the status of the connected appliance.

```
dts physical-appliance show
```

For example:

```
Appliance Info :
 encryptionConfigured : true
 lockStatus : NOT_LOCKED
 finalizeStatus : NOT_FINALIZED
 totalSpace : 64.56 GB
 availableSpace : 64.53 GB
```

Step 2: Configuring Appliance Encryption

You must configure the appliance to use encryption. Oracle Cloud Infrastructure creates a strong passphrase for each appliance. The Data Transfer Utility securely collects the strong passphrase from Oracle Cloud Infrastructure and sends that passphrase to the Data Transfer service.

If your environment requires Internet-aware applications to use network proxies, ensure that you set up the required Linux environment variables. See the HTTP proxy information in the Data Transfer Utility topic.

Important

If you are working with multiple appliances at the same time, be sure the job ID and appliance label you specify in this step matches the physical appliance you are currently working with. You can get the serial number associated with the job ID and appliance label using the Data Transfer Utility or the Console. You can find the serial number of the physical appliance on the back of the device on the agency label.

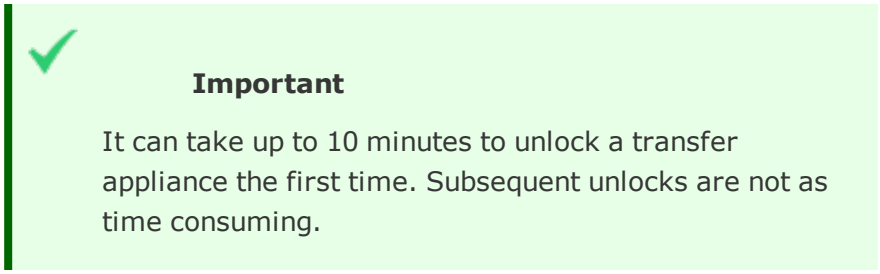
To configure transfer appliance encryption

At the command prompt on the host, run `dts physical-appliance configure-encryption` to configure appliance encryption.

```
dts physical-appliance configure-encryption --job-id <job_id> --appliance-label <label>
```

For example:

```
dts physical-appliance configure-encryption --job-id
"ocid1.datatransferjob.region1.phx..exampleuniqueID" --appliance-label "XA8XM27EVH"
```



Step 3: Unlocking the Transfer Appliance

Before you can write data to the transfer appliance, you must unlock the appliance. Unlocking the transfer appliance requires the strong passphrase that is created by Oracle Cloud Infrastructure for each appliance. Unlocking can be accomplished in two different ways:

- If you provide the `--job-id` and `--appliance-label` when running the `unlock` command, the Data Transfer Utility retrieves the passphrase from Oracle Cloud

Infrastructure and sends it to the transfer appliance during the unlock operation.

- You can query Oracle Cloud Infrastructure for the passphrase and provide that passphrase when prompted during the unlock operation.

Important

It can take up to 10 minutes to unlock a transfer appliance the first time. Subsequent unlocks are not as time consuming.

To have the Data Transfer Utility retrieve the passphrase to unlock the transfer appliance

At the command prompt on the host, run `dts physical-appliance unlock` with `--job-id` and `--appliance-label` to unlock the appliance.

```
dts physical-appliance unlock --job-id <job_id> --appliance-label <label>
```

For example:

```
dts physical-appliance unlock --job-id
"ocid1.datatransferjob.region1.phx.exampleccsoazstiksiyurk7f5xhveazrbzdpwhqiwwuklxw3g5hb4movoa" --
appliance-label "XA8XM27EVH"
```

To query Oracle Cloud Infrastructure for the passphrase to provide to unlock the transfer appliance

At the command prompt on the host, run `dts appliance get-passphrase` to obtain the passphrase from the Oracle Cloud Infrastructure.

```
dts appliance get-passphrase --job-id <job_id> --appliance-label <label>
```

Then, run `dts physical-appliance unlock` without `--job-id` and `--appliance-label` and supply the passphrase when prompted.

```
dts physical-appliance unlock
```

Writing Data to the Transfer Appliance

Appliance data transfer supports NFS-v3 to write data to the appliance. In preparation for writing data, create and configure a dataset to write to. A dataset is a collection of files that are treated similarly. You can write up to 100 million files onto the appliance for transfer. We currently support one dataset per transfer appliance.

Important

Files written to the appliance must be world readable and the directories must be world readable and world executable. If files and directories do not match this criteria, you will not be able to seal the appliance.

You can only copy regular files to transfer appliances. Special files (for example, links, sockets, and pipes) cannot be copied directly. To transfer special files, create a tar archive of these files and copy the tar archive to the transfer appliance.

Tip

You can only use the Data Transfer Utility to create, configure, and allow access to a dataset over NFS.

Step 1: Creating an NFS dataset

To create an NFS dataset

At the command prompt on the host, run `dts nfs-dataset create` to create an NFS dataset.

```
dts nfs-dataset create --name <dataset_name>
```

For example:

```
dts nfs-dataset create --name nfs-ds-1
```

Step 2: Configuring export settings on the dataset

To configure export settings on an NFS dataset

At the command prompt on the host, run `dts nfs-dataset set-export` to configure export settings on an NFS dataset.

```
dts nfs-dataset set-export --name <dataset_name> --rw=true --world=true
```

For example:

```
dts nfs-dataset set-export --name nfs-ds-1 --rw=true --world=true
```

Here is another example of creating the export to give read/write access to a subnet:

```
dts nfs-dataset set-export --name nfs-ds-1 --ip=10.0.0.0 --subnet-mask-length=24 --rw=true --world=false
```

Step 3: Activating the dataset

Activation creates the NFS export, making the dataset accessible to NFS clients.

To activate the NFS dataset

At the command prompt on the host, run `dts nfs-dataset activate` to activate the NFS dataset.

```
dts nfs-dataset activate --name <dataset_name>
```

For example:

```
dts nfs-dataset activate --name nfs-ds-1
```

Step 4: Confirming that the NFS share is visible

To confirm that the NFS share is visible

At the command prompt on the host, use the `showmount` command to confirm that the NFS share is visible.

```
showmount -e <appliance_ip>
```

For example:

```
showmount -e 10.0.0.1
Export list for 10.0.0.1:
/data/nfs-ds-1 *
```

Step 5: Mounting the NFS share

To mount the NFS share

At the command prompt on the host, use the `mount` command to mount the NFS share.

```
mount -t nfs <appliance_ip>:/data/<dataset_name> <mountpoint>
```

For example:

```
mount -t nfs 10.0.0.1:/data/nfs-ds-1 /mnt/nfs-ds-1
```

After the NFS share is mounted, you can write data to the share.

Step 6: Writing data to the share

Copy your data to the transfer appliance using normal file system tools.

Important

Files written to the appliance must be world readable and the directories must be world readable and world executable. If files and directories do not match this criteria, you will not be able to seal the appliance.

Step 7: Deactivating the dataset

After you are done writing data, deactivate the dataset. Deactivation removes the NFS export on the dataset, disallowing any further writes.

To deactivate the NFS dataset

At the command prompt on the host, run `dts nfs-dataset deactivate` to deactivate the NFS dataset.

```
dts nfs-dataset deactivate --name <dataset_name>
```

For example:

```
dts nfs-dataset deactivate --name nfs-ds-1
```

Step 8: Sealing the dataset

Sealing a dataset stops all writes to the dataset. Sealing a dataset is a long running process that can take some time to complete. The completion time depends upon the number of files and total amount of data that was copied to the transfer appliance.

If you issue the `seal` command without the `--wait` option, the seal operation is triggered and runs in the background. You are returned to the command prompt and can use the `seal-status` command to monitor the sealing status. If you issue the `seal` command with the `--wait` option, the seal operation is triggered and continues to provide status updates until sealing completion.

Important

Files written to the appliance must be world readable and the directories must be world readable and world executable. If files and directories do not match this criteria, you will not be able to seal the appliance.

The sealing operation generates a manifest across all files in the dataset. The manifest contains an index of all of the copied files and generated data integrity hashes.

If the seal process fails with reasons like `Failed to walk filesystem - java.nio.file.AccessDeniedException: /data/la-rc-ds/dir1/dir2` or `Number of files with no read perms : 1`, reactivate the dataset and correct permissions for the files and directories.

To seal the NFS dataset

At the command prompt on the host, run `dts nfs-dataset seal` to seal the NFS dataset.

```
dts nfs-dataset seal --name <dataset_name> [--wait]
```

For example:

```
dts nfs-dataset seal --name nfs-ds-1
Seal initiated. Please use seal-status command to get progress.
```

To monitor the dataset sealing process

At the command prompt on the host, run `dts nfs-dataset seal-status` to monitor the dataset sealing process.

```
dts nfs-dataset seal-status --name <dataset_name>
```

For example, here is the status that is issued upon sealing completion:

```
dts nfs-dataset seal-status --name nfs-ds-1

Seal Status :
```

```
success           : true
failureReason     : *** none ***
startTime         : 2018/07/10 18:24:05 EDT
endTime           : 2018/07/10 18:24:06 EDT
numFilesToProcess : 2000
numFilesProcessed : 2000
bytesToProcess    : 1.95 GB
bytesProcessed    : 1.95 GB
```

Finalizing the Transfer Appliance

Tip

You can only use the Data Transfer Utility to finalize the transfer appliance.

Finalizing an appliance tests and copies the following to the transfer appliance:

- Upload user configuration credentials
- Private PEM key details
- Name of the upload bucket

The credentials, certificate, and bucket are required for Oracle to be able to upload your data to Oracle Cloud Infrastructure Object Storage. When you finalize a transfer appliance, you can no longer access the appliance for dataset operations unless you unlock the appliance. See Reopening a Dataset if you need to unlock an appliance that was finalized.

Important

If you are working with multiple appliances at the same time, be sure the job ID and appliance label you specify in this step matches the physical appliance you are currently working with. You can get the serial number associated with the job ID and appliance label using the Data Transfer Utility or the Console. You can find the serial number of the physical appliance on the back of the device on the agency label.

To finalize the appliance

1. Deactivate and seal the dataset before finalizing the appliance.
2. At the command prompt on the host, run `dts physical-appliance finalize` to finalize a transfer appliance.

```
dts physical-appliance finalize --job-id <job_id> --appliance-label <label>
```

For example:

```
dts physical-appliance finalize --job-id "ocid1.datatransferjob.region1.phx..exampleuniqueID" --
appliance-label "XA8XM27EVH"
```

Reopening a Dataset

Tip

You can only use the Data Transfer Utility to reopen a dataset.

If changes are necessary after sealing a dataset or finalizing an appliance, you must reopen the dataset to modify the contents. Make the required changes and again seal the dataset. Resealing the dataset generates a new manifest.

Note

If an appliance is rebooted or power cycled, follow the instructions in this topic to reopen the dataset.

Step 1: Unlocking the Transfer Appliance

Before you can write data to the transfer appliance, you must unlock the appliance. Unlocking the transfer appliance requires the strong passphrase that is created by Oracle Cloud Infrastructure for each appliance. Unlocking can be accomplished in two different ways:

- If you provide the `--job-id` and `--appliance-label` when running the `unlock` command, the Data Transfer Utility retrieves the passphrase from Oracle Cloud Infrastructure and sends it to the transfer appliance during the unlock operation.
- You can query Oracle Cloud Infrastructure for the passphrase and provide that passphrase when prompted during the unlock operation.

To have the Data Transfer Utility retrieve the passphrase to unlock the transfer appliance

At the command prompt on the host, run `dts physical-appliance unlock` with `--job-id` and `--appliance-label` to unlock the appliance.

```
dts physical-appliance unlock --job-id <job_id> --appliance-label <label>
```

For example:

```
dts physical-appliance unlock --job-id
"ocid1.datatransferjob.region1.phx.exampleccsoazstiksiyurk7f5xhveazrbzdpwhqiwwuklxw3g5hb4movoa" --
appliance-label "XA8XM27EVH"
```

To query Oracle Cloud Infrastructure for the passphrase to provide to unlock the transfer appliance

At the command prompt on the host, run `dts appliance get-passphrase` to obtain the passphrase from the Oracle Cloud Infrastructure.

```
dts appliance get-passphrase --job-id <job_id> --appliance-label <label>
```

Then, run `dts physical-appliance unlock` without `--job-id` and `--appliance-label` and supply the passphrase when prompted.

```
dts physical-appliance unlock
```

Step 2: Reopening the Transfer Appliance

Reopen the dataset to write data to the transfer appliance again.

To reopen an NFS dataset

At the command prompt on the host, run `dts nfs-dataset reopen` to reopen an NFS dataset.

```
dts nfs-dataset reopen --name <dataset_name>
```

Step 3: Repeat Steps to Write Data to the Appliance

Repeat the same tasks you performed when you originally wrote data to the appliance beginning with activating the dataset in the Writing Data to the Transfer Appliance section.

Shutting Down the Transfer Appliance

Shut down the appliance before packing up and shipping the appliance back to Oracle.

To shut down the appliance

Using the terminal emulator on the host machine, select **Shutdown** from the appliance serial console.

Packing and Shipping Transfer Appliance to Oracle

Return the appliance to Oracle within 30 days. If you need the transfer appliance beyond the standard 30-day window, you can file a Service Request (SR) to ask for an extension of up to 60 days.

Important

Review and follow the instructions that were provided in the transit case with the appliance.

To pack and ship the appliance

1. Unplug the power cord from the power source and detach the other end of the cord from the appliance.
2. Disconnect the appliance from your network.
3. Remove the return shipment tamper-evident security tie from the transit case.
4. Place the transfer appliance, power cord, and serial cable in the transit case.

Warning

We recommend assistance lifting and placing the transfer appliance back into the transit case. The total shipping weight is about 64 lbs (29.0299 kg) and appliance weight is 38 lbs (17.2365 kg).

5. Close and secure the transit case with the return tamper-evident security tie.
6. Loop the top of the plastic tie-on tag with return shipping label through the handle of the transit case. Remove the protective tape from the back of the tie-on tag, exposing the adhesive area to secure the tag onto itself. Use the provided zip tie to secure the tie-on

tag to the handle.

7. Return the transit case to FedEx by doing one of the following:
   - Drop off the packed, sealed, and labeled transit case to an FedEx Authorized ShipCenter location or a nearby FedEx Office location. *Obtain a receipt from the vendor to certify transfer of custody.*
   - Schedule a pickup with FedEx at your location. Ensure that the transit case is packed, sealed, and labeled before FedEx arrives for pickup.

   The shipping vendor notifies Oracle when the transfer appliance is shipped back to Oracle for upload to Oracle Cloud Infrastructure Object Storage.

Canceling a Transfer Appliance

If you change your mind about uploading your data to Oracle Cloud Infrastructure, you must cancel the transfer appliance. You can only cancel a transfer appliance after you ship the appliance back to Oracle. You can cancel one transfer appliance, while allowing the file upload from other appliances.

Oracle does not process canceled transfer appliances. Oracle retains the canceled transfer appliance and wipes all the data from the device.

To cancel a transfer device using the Data Transfer Utility

At the command prompt on the host, run `dts appliance cancel` to cancel a transfer device.

```
dts appliance cancel --job-id <job_id> --appliance-label <label>
```

Monitoring the Status of Your Transfer Appliance Return Shipment

The shipping vendor notifies Oracle when your transfer appliance is picked up and shipped back for upload to Oracle Cloud Infrastructure Object Storage.

To monitor the status of your transfer appliance return shipment using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the transfer job and transfer appliance that you shipped back to Oracle for data upload.
3. Under **Transfer Appliances**, look at the **Status** field.

Here are the key status values to look for when monitoring your transfer appliance return shipment:

- **Return Shipped**: You shipped your transfer appliance back to Oracle. The status displays **Return Shipped** until Oracle receives your transfer appliance.
- **Oracle Received**: Oracle received your transfer appliance shipment. The status displays **Oracle Received** until Oracle processes and uploads the data from your transfer appliance.
- **Oracle Received Canceled**: You canceled your transfer appliance after you shipped the appliance back to Oracle. Oracle received your canceled transfer appliance. Oracle does *not* upload the appliance data.
- **Processing**: Oracle is processing and uploading data from your transfer appliance. The status displays **Processing** until the transfer appliance upload is complete.
- **Complete**: Oracle completed your transfer appliance data upload. Your data is available in your designated bucket in Oracle Cloud Infrastructure Object Storage.

Reviewing the Transfer Appliance Log Files

Oracle creates transfer log files for each transfer appliance uploaded. The logs are placed in the bucket where the transfer device data was uploaded. The log file compares the transfer appliance's manifest file to the contents of the target Oracle Cloud Infrastructure Object Storage bucket after file upload.

> **Note**
>
> If you chose to upload your data to an Archive Storage bucket, you must first restore the log file object before you can download that file for review.

The top of the log report summarizes the overall file processing status:

```
P - Present: The file is present in both the device and the target bucket
M - Missing: The file is present in the device but not the target bucket. It was likely uploaded and
then deleted by another user before the summary was generated.
C - Name Collision: The file is present in the manifest but a file with the same name but different
contents is present in the target bucket.
U - Unreadable: The file is not readable from the disk
N - Name Too Long: The file name on disk is too long and could not be uploaded
```

Complete file upload details follow the summary.

```
##########################################################################################################################################
########################################  SUMMARY FOR DISK [WDH0B87L] ####################################################
Generated    2017-09-08 19:46:36
TOTAL : 1110
### P present:       1110
### M missing:       0
### C name collision: 0
### U unreadable:    0
### N nameTooLong:   0
##########################################################################################################################################################################################
|    STATUS     |                        NAME                        |        LAST_MODIFIED          |    SIZE(MB)    |            MD5             |                ETag                |
|    present    |                   small/01/T6QHX                   |  Fri Sep 08 19:04:54 UTC 2017 |     10.00      |  8clkXbwU793H2KMiaF8m6w==  |  58B2F70D1C874AAAE053824310ACAC52   |
|    present    |                   small/01/FAFUK                   |  Fri Sep 08 19:12:20 UTC 2017 |     10.00      |  8clkXbwU793H2KMiaF8m6w==  |  58B2ECE4616E46D8E053824310AC6DF6   |
|    present    |                   small/01/EVPFD                   |  Fri Sep 08 19:02:42 UTC 2017 |     10.00      |  8clkXbwU793H2KMiaF8m6w==  |  58B2ECDFA74946D6E053824310AC383A   |
|    present    |                   small/01/2UO2W                   |  Fri Sep 08 19:13:06 UTC 2017 |     10.00      |  8clkXbwU793H2KMiaF8m6w==  |
```

If you upload more than 100,000 files, the upload details are broken into multiple pages. You can only download the first page from the Console. Download the rest of the pages directly from the Object Storage bucket. The subsequent pages have the same object name as the first page, but have an enumerated suffix.

Closing a Transfer Job

Tip

You can use the Console or the Data Transfer Utility to close a transfer job.

Typically, you would close a transfer job when no further transfer job activity is required or possible. Closing a transfer job requires that the status of all associated transfer appliances be returned, canceled, or deleted.

To close a transfer job using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find the data transfer package for which you want to display the details.
3. Click the Actions icon (three dots), and then click **View Details**.
   Alternatively, click the hyper-linked name of the transfer job.
4. Click **Close Transfer Job**.

To close a transfer job using the Data Transfer Utility

At the command prompt on the host, run `dts job close` to close a transfer job.

```
dts job close --job-id <job_id>
```

Data Transfer Appliance Statuses

Oracle provides status updates daily throughout the transfer appliance request, ship, return ship, and data upload processes.

Tip

You can use the Console or the Data Transfer Utility to monitor transfer appliance-related status.

Monitoring Transfer Appliance Status

To monitor the status of your transfer appliance using the Console

1. Open the navigation menu. Under **Core Infrastructure**, go to **Object Storage** and click **Data Transfer**.
2. Find and select the transfer job for which you want to monitor transfer appliance status.
3. Under **Transfer Appliances**, look at the **Status** field.

To monitor the status of your transfer appliance using the Data Transfer Utility

At the command prompt on the host, run `dts appliance show` to monitor a transfer appliance status.

```
dts appliance show --job-id <job_id> -appliance <label>
```

Transfer Appliance Status Values

Here are the transfer appliance status values, listed in alphabetic order:

CANCELED

You can change your mind about uploading your data to Oracle Cloud Infrastructure Object Storage and cancel your transfer appliance. Ship the appliance back to Oracle and then cancel the appliance. Oracle always uses secure wipe tools on the boot and data areas whenever a transfer appliance is returned.

COMPLETE

Oracle completed your transfer appliance data upload. Your data is available in your designated bucket in Oracle Cloud Infrastructure Object Storage.

CUSTOMER LOST

You have not returned a data transfer appliance within the required 90 days.

DELIVERED

Oracle received a delivery confirmation from the shipping vendor that your transfer appliance was delivered. When the appliance is delivered, Oracle provides the date and time the appliance was received in the transfer appliance details. Appliance usage tracking begins.

ERROR

Oracle encountered an unrecoverable error trying to process your transfer appliance. Oracle cannot upload your data from the appliance. To protect your data, Oracle uses secure wipe tools on the boot and data areas any transfer appliance that cannot be processed.
Complete another request for a transfer appliance.

ORACLE PREPARING

Oracle approved your transfer appliance request. The status displays preparing until the transfer appliance is shipped to you.

ORACLE RECEIVED

Oracle received your transfer appliance shipment. The status displays Oracle received until Oracle begins processing and uploading your transfer appliance.

ORACLE RECEIVED CANCELED

You canceled your transfer appliance after you shipped the appliance back to Oracle. Oracle received your canceled transfer appliance. Oracle does *not* upload the appliance data.

PREPARING

You activated your transfer appliance. You can now copy your data onto the transfer appliance. The status displays preparing until you ship the transfer appliance back to Oracle.

PROCESSING

Oracle is processing and uploading the data from your transfer appliance. The status displays the processing status until Oracle completes uploading your data from your transfer appliance.

REJECTED

Oracle denied your transfer appliance request.

Important

If your appliance request is denied and you have questions, contact your Sales Representative or file a Service Request (SR).

REQUESTED

You successfully completed your request for a transfer appliance. The status displays requested until Oracle approves your transfer appliance request.

RETURN SHIPPED

Oracle received confirmation from the shipping vendor that you shipped your transfer appliance back to Oracle. The status displays return shipped until Oracle receives your transfer appliance.

RETURN SHIPPED CANCELED

You canceled your transfer appliance after the appliance was delivered to you or after you shipped the appliance back to Oracle. Oracle received confirmation from the shipping

vendor that your canceled transfer appliance is on the way back to Oracle. The status displays return shipped canceled until Oracle receives your transfer appliance.

SHIPPING

Oracle completed the necessary preparations and shipped your transfer appliance. When the appliance is shipped, Oracle provides the serial number of the appliance, the shipping vendor, and the tracking number in the appliance details. The status displays shipping until the appliance is delivered to you.

CHAPTER 9 Database

This chapter explains how to launch a DB System and manage databases on DB Systems.

Overview of the Database Service

The Database service offers autonomous and user-managed Oracle Database solutions. Autonomous databases are preconfigured, fully-managed environments that are suitable for either transaction processing or for data warehouse workloads. User-managed solutions are bare metal, virtual machine, and Exadata DB systems that you can customize with the resources and settings that meet your needs.

You can quickly provision a user-managed DB system or autonomous database. You have full access to the features and operations available with the database, but Oracle owns and manages the infrastructure.

For details about each offering, start with the following overview topics:

DB Systems

- Exadata DB Systems
- Bare Metal and Virtual Machine DB Systems

Autonomous Databases

The Database service offers Oracle's Autonomous Database with transaction processing and data warehouse workload types.

License Types and Bring Your Own License (BYOL) Availability

Oracle Cloud Infrastructure supports a licensing model with two license types. With **License included**, the cost of the cloud service includes a license for the Database service. With **Bring Your Own License (BYOL)**, Oracle Database customers can use existing licenses with Oracle Cloud Infrastructure. Note that Oracle Database customers remain responsible for

complying with license restrictions applicable to their BYOL licenses, as defined in their program order for those licenses.

You do not need separate on-premises licenses and cloud licenses. BYOL databases support all advanced Database service manageability functionality, including backing up and restoring a DB system, patching, and Oracle Data Guard.

You can choose BYOL when you launch an Oracle Cloud Infrastructure database or DB system. Choosing BYOL impacts how the usage data for the instance is metered and subsequent billing.

Note that on some provisioning dialogs in the Console, the BYOL option is labeled **My Organization Already Owns Oracle Database Software Licenses**.

For additional information about license pricing and features, see https://cloud.oracle.com/database/pricing.

Resource Identifiers

Most types of Oracle Cloud Infrastructure resources have a unique, Oracle-assigned identifier called an Oracle Cloud ID (OCID). For information about the OCID format and other ways to identify your resources, see Resource Identifiers.

Ways to Access Oracle Cloud Infrastructure

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see Software Development Kits and Command Line Interface.

To access the Console, you must use a supported browser. Oracle Cloud Infrastructure supports the latest desktop versions of Google Chrome, Microsoft Edge, Internet Explorer 11, Safari, Firefox, and Firefox ESR. Note that private browsing mode is not supported for Firefox, Internet Explorer, or Edge. Mobile browsers are not supported.

For more information on tenancies and compartments, see "Key Concepts and Terminology" in the *Oracle Cloud Infrastructure Getting Started Guide*. For general information about using the API, see REST APIs.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to write policies that provide stricter access to database resources, see Details for the Database Service.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

For common policies used to authorize Oracle Cloud Infrastructure Database users, see Common Policies.

For in-depth information on granting users permissions for the Database service, see Details for the Database Service in the IAM policy reference.

Limits on the Database Service

See Service Limits for a list of applicable limits and instructions for requesting a limit increase.

Many Database API operations are subject to throttling.

Exadata DB Systems

Exadata DB systems allow you to leverage the power of Exadata within the Oracle Cloud Infrastructure. An Exadata DB system consists of a quarter rack, half rack, or full rack of compute nodes and storage servers, tied together by a high-speed, low-latency InfiniBand network and intelligent Exadata software. You can configure automatic backups, optimize for different workloads, and scale up the system to meet increased demands.

Note

Exadata DB systems launched on or after March 14, 2019 run Oracle Linux 7 (OL7). Previously launched systems are running Oracle Linux 6 (OL6). See OS Updates for important information about updating existing Exadata DB system operating systems.

Supported Database Edition and Versions

Exadata DB systems require Enterprise Edition - Extreme Performance. This edition provides all the features of Oracle Database Enterprise Edition, plus all the database enterprise management packs and all the Enterprise Edition options, such as Oracle Database In-Memory and Oracle Real Application Clusters (RAC).

Exadata DB systems support the following software releases:

- Oracle Database 18c Release 1 (18.0)
- Oracle Database 12c Release 2 (12.2)
- Oracle Database 12c Release 1 (12.1)
- Oracle Database 11g Release 2 (11.2)

Subscription Types

The only subscription type available for Exadata DB systems is the Monthly Flex purchase model under Universal Credit Pricing. See https://www.oracle.com/cloud/bring-your-own-license/faq/universal-credit-pricing.html for more information.

Metering Frequency

For each Exadata DB system you provision, you are billed for the infrastructure for the first month, and then by the hour after that. Each OCPU you add to the system is billed by the hour from the time you add it.

Scaling an Exadata DB System

Two kinds of scaling operations are supported for an Exadata DB system:

- Scaling within an Exadata DB system lets you modify compute node processing power within the system.
- Scaling across Exadata DB system configurations lets you move to a different configuration, for example, from a quarter rack to a half rack.

Scaling Within an Exadata System

If an Exadata DB system requires more compute node processing power, you can scale up the number of enabled CPU cores in the system. For a non-metered Exadata DB system, you can temporarily modify the compute node processing power (bursting) or add compute node processing power on a more permanent basis. For a metered Exadata DB system, you can simply modify the number of enabled CPU cores.

You can provision an X7 Exadata DB system with zero CPU cores, or scale the DB system down to zero cores after you provision it. With zero cores, you are billed only for the infrastructure until you scale up the system. For detailed information about pricing, see https://cloud.oracle.com/iaas/database/exadata/pricing.

For information on CPU cores per configuration, see System Configuration. To learn how to scale a system, see To scale an Exadata DB system.

Scaling Across Exadata DB System Configurations

Scaling across Exadata DB system configurations enables you to move to a different system configuration. This is useful when a database deployment requires:

- Processing power that is beyond the capacity of the current system configuration.
- Storage capacity that is beyond the capacity of the current system configuration.
- A performance boost that can be delivered by increasing the number of available compute nodes.
- A performance boost that can be delivered by increasing the number of available Exadata Storage Servers.

Scaling from a quarter rack to a half rack, or from a half rack to a full rack, requires that the data associated with your database deployment is backed up and restored on a different Exadata DB system, which requires planning and coordination between you and Oracle. To start the process, submit a service request to Oracle.

System Configuration

Exadata DB systems are offered in quarter rack, half rack or full rack configurations, and each configuration consists of compute nodes and storage servers. The compute nodes are each configured with a Virtual Machine (VM). You have root privilege for the compute node VMs, so you can load and run additional software on them. However, you do not have administrative access to the Exadata infrastructure components, including the physical compute node hardware, network switches, power distribution units (PDUs), integrated lights-out management (ILOM) interfaces, or the Exadata Storage Servers, which are all administered by Oracle.

You have full administrative privileges for your databases, and you can connect to your databases by using Oracle Net Services from outside the Oracle Cloud Infrastructure. You are responsible for database administration tasks such as creating tablespaces and managing

database users. You can also customize the default automated maintenance set up, and you control the recovery process in the event of a database failure.

The following two tables provide the details for each shape's configuration.

Exadata X7 Shapes

Property	Quarter Rack	Half Rack	Full Rack
Shape Name	Exadata.Quarter2.92	Exadata.Half2.184	Exadata.Full2.368
Number of Compute Nodes	2	4	8
Total Minimum Number of Enabled CPU Cores	0	0	0
Total Maximum Number of Enabled CPU Cores	92	184	368
Total RAM Capacity	1440 GB	2880 GB	5760 GB
Number of Exadata Storage Servers	3	6	12
Total Raw Flash Storage Capacity	76.8 TB	153.6 TB	307.2 TB
Total Usable Storage Capacity	106 TB	212 TB	424 TB

Exadata X7 shapes provide 1 TB of user disk space for database homes.

Exadata X6 Shapes

Property	Quarter Rack	Half Rack	Full Rack
Shape Name	Exadata.Quarter1.84	Exadata.Half1.168	Exadata.Full1.336
Number of Compute Nodes	2	4	8
Total Minimum (Default) Number of Enabled CPU Cores	22	44	88
Total Maximum Number of Enabled CPU Cores	84	168	336
Total RAM Capacity	1440 GB	2880 GB	5760 GB
Number of Exadata Storage Servers	3	6	12
Total Raw Flash Storage Capacity	38.4 TB	76.8 TB	153.6 TB
Total Usable Storage Capacity	84 TB	168 TB	336 TB

Exadata X6 shapes provide 200 GB of user disk space for database homes.

Storage Configuration

When you launch an Exadata DB system, the storage space inside the Exadata storage servers is configured for use by Oracle Automatic Storage Management (ASM). By default, the following ASM disk groups are created:

- The DATA disk group is intended for the storage of Oracle Database data files.
- The RECO disk group is primarily used for storing the Fast Recovery Area (FRA), which is an area of storage where Oracle Database can create and manage various files related to backup and recovery, such as RMAN backups and archived redo log files.
- The DBFS and ACFS disk groups are system disk groups that support various operational purposes. The DBFS disk group is primarily used to store the shared clusterware files (Oracle Cluster Registry and voting disks), while the ACFS disk groups are primarily used to store Oracle Database binaries. Compared to the DATA and RECO disk groups, the system disk groups are so small that they are typically ignored when discussing the overall storage capacity. You should not store Oracle Database data files or backups inside the system disk groups.

The disk group names contain a short identifier string that is associated with your Exadata Database machine environment. For example, the identifier could be C2, in which case the DATA disk group would be named DATAC2, the RECO disk group would be named RECOC2, and so on.

In addition, you can create a SPARSE disk group. A SPARSE disk group is required to support Exadata snapshots. Exadata snapshots enable space-efficient clones of Oracle databases that can be created and destroyed very quickly and easily. Snapshot clones are often used for development, testing, or other purposes that require a transient database.

Impact of Configuration Settings on Storage

If you choose to perform database backups to the Exadata storage, or to create a sparse disk group, or to do both, your choices profoundly affect how storage space in the Exadata storage servers is allocated to the ASM and sparse disk groups.

The table that follows shows the approximate percentages of storage allocated for DATA, RECO, and SPARSE disk groups for each possible configuration.

Configuration Settings	DATA Disk Group	RECO Disk Group	SPARSE Disk Group
Database backups on Exadata storage: No **Sparse disk group: No**	80 %	20 %	0 %
Database backups on Exadata storage: Yes **Sparse disk group: No**	40 %	60 %	0 %
Database backups on Exadata storage: No **Sparse disk group: Yes**	60 %	20 %	20 %
Database backups on Exadata storage: Yes **Sparse disk group: Yes**	35 %	50 %	15 %

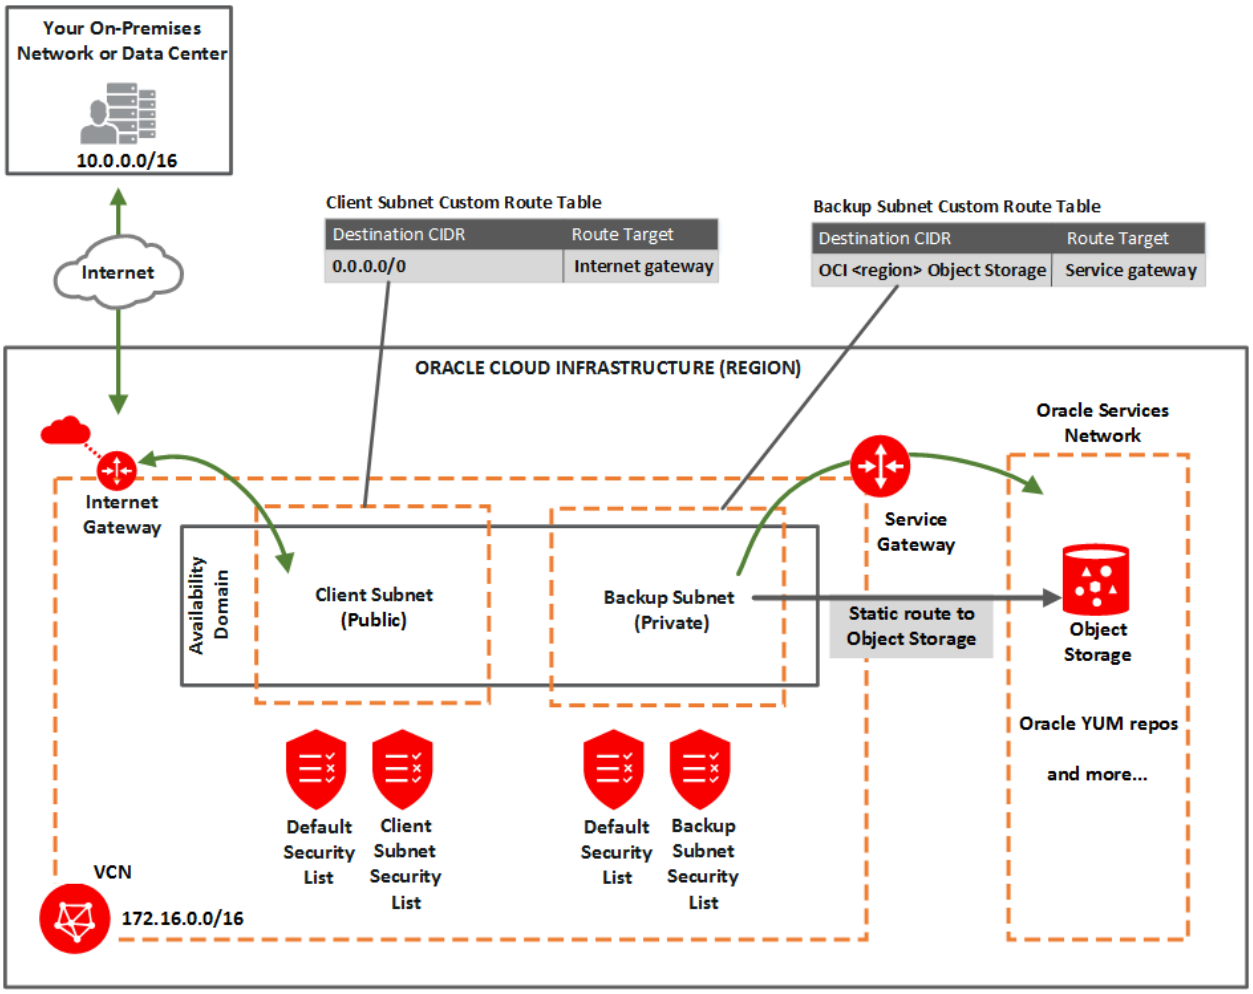
Network Setup for Exadata DB Systems

Before you set up an Exadata DB system, you must set up a virtual cloud network (VCN) and other Networking service components. This topic describes the recommended configuration for the VCN and several related requirements for the Exadata DB system.

VCN and Subnets

To launch an Exadata DB system, you must have:

- A VCN in the region where you want the DB system
- At least two subnets in the VCN. The two subnets are:



- Client subnet
- Backup subnet

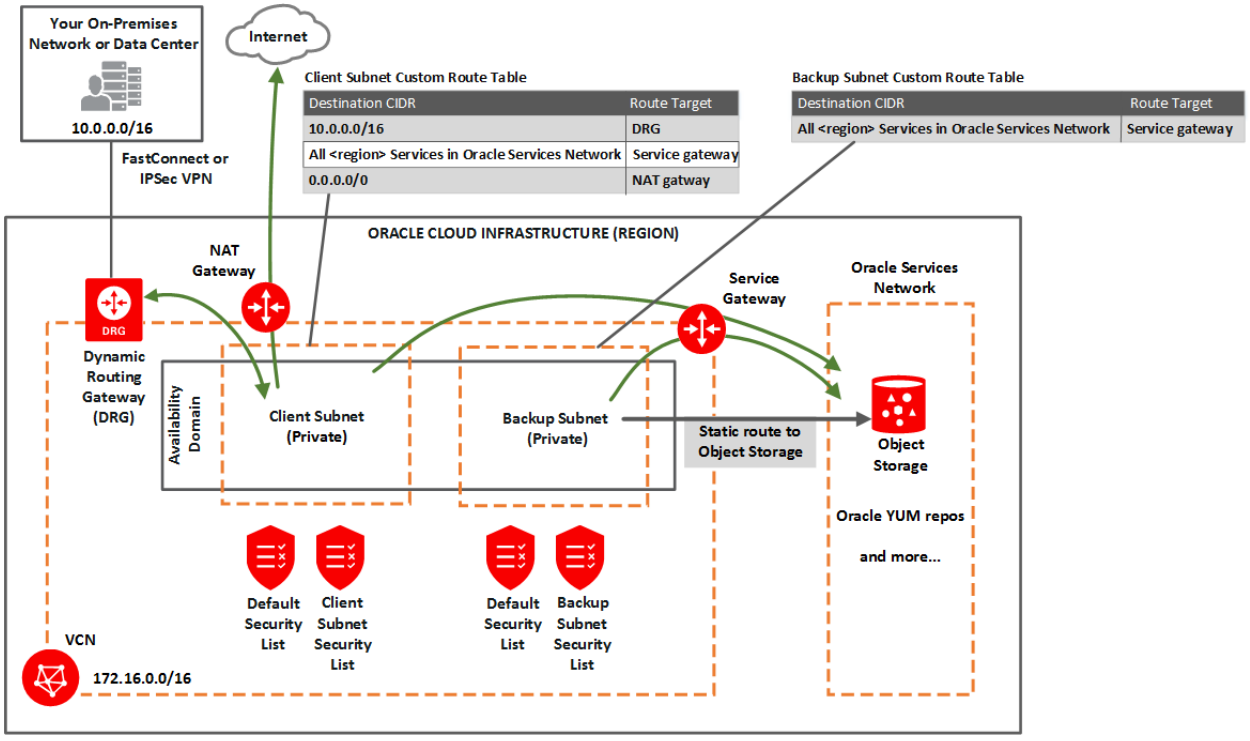
In general, Oracle recommends using regional subnets, which span all availability domains in the region. If you instead use AD-specific subnets, both the client and backup subnets must be in the same availability domain. The important thing to know for your DB system is that the resources you create in the two subnets must be in the same availability domain. For more information, see About Regional Subnets.

You will create custom route tables and security lists for each subnet. More information follows about that.

Option 1: Public Client Subnet with Internet Gateway

This option can be useful when doing a proof-of-concept or development work. You can use this setup in production if you want to use an internet gateway with the VCN, or if you have services that run only on a public network and need access to the database. See the following diagram and description.

You set up:



- Subnets:
  - *Public* client subnet (*public* means that the resources in the subnet can have public IP addresses at your discretion).

    - Private backup subnet (*private* means that the resources in the subnet cannot have public IP addresses and therefore cannot receive incoming connections from the internet).
- Gateways for the VCN:
    - Internet gateway (for use by the client subnet).
    - Service gateway (for use by the backup subnet). Also see Option 1: Service Gateway Access Only to Object Storage.
- Route tables:
    - Custom route table for the public client subnet, with a route for 0.0.0.0/0, and target = the internet gateway.
    - Separate custom route table for the private backup subnet, with a route rule for the service CIDR label called **OCI *<region>* Object Storage**, and target = the service gateway. Also see Option 1: Service Gateway Access Only to Object Storage.
- Security lists:
    - Default security list (with its default rules) for both the public client subnet and private backup subnet. **This security list contains several basic rules that are necessary for the DB system (such as ingress SSH access to the DB system, and general egress from the DB system).**
    - Custom security list for the public client subnet only. For the rules to use, see Rules for Client Subnet's Custom Security List.
    - Separate custom security list for the private backup subnet only. For the rules to use, see Rule for Backup Subnet's Custom Security List.
- Static route on the DB system's compute nodes (to enable access to Object Storage by way of the backup subnet).

> **Important**
>
> See this known issue for information about configuring route rules with *service gateway* as the target on route tables associated with public subnets.

OPTION 2: PRIVATE SUBNETS

This option is recommended for a production system. Both subnets are private and cannot be reached from the internet. See the following diagram and description.

You set up:

- Subnets:
  - *Private* client subnet.
  - Private backup subnet.
- Gateways for the VCN:
  - Dynamic routing gateway (DRG), with a FastConnect or IPSec VPN to your on-premises network (for use by the client subnet).
  - Service gateway (for use by the backup subnet to reach Object Storage, and for use by the client subnet to reach the Oracle YUM repo for OS updates). Also see Option 2: Service Gateway Access to Both Object Storage and YUM Repos.
  - NAT gateway (for use by the client subnet to reach public endpoints not supported by the service gateway).
- Route tables:
  - Custom route table for the private client subnet, with two rules:
    - A rule for the on-premises network's CIDR, and target = DRG.
    - A rule for the service CIDR label called **All *<region>* Services in Oracle Services Network**, and target = the service gateway. The *Oracle Services Network* is a conceptual network in Oracle Cloud Infrastructure that is reserved for Oracle services. The rule enables the client subnet to reach the regional Oracle YUM repo for OS updates. Also see Option 2: Service Gateway Access to Both Object Storage and YUM Repos.
    - A rule for 0.0.0.0/0, and target = NAT gateway.
  - Separate custom route table for the private backup subnet, with one rule:
    - The same rule as for the client subnet: for the service CIDR label called **All *<region>* Services in Oracle Services Network**, and target = the service gateway. This rule enables the backup subnet to reach the regional Object Storage for backups.
- Security lists:

- Default security list (with its default rules) for both the private client subnet and private backup subnet. **This security list contains several basic rules that are necessary for the DB system (such as ingress SSH access to the DB system, and general egress from the DB system).**
- Custom security list for the private client subnet only. For the rules to use, see Rules for Client Subnet's Custom Security List.
- Separate custom security list for the private backup subnet only. For the rules to use, see Rule for Backup Subnet's Custom Security List.

- Static route on the DB system's compute nodes (to enable access to Object Storage by way of the backup subnet).

Requirements for IP Address Space

If you're setting up Exadata DB systems (and thus VCNs) in more than one region, make sure the IP address space of the VCNs does not overlap. This is important if you want to set up disaster recovery with Oracle Data Guard.

The two subnets you create for the Exadata DB system must not overlap with 192.168.128.0/20.

The following table lists the *minimum* required subnet sizes, depending on the Exadata rack size. For the client subnet, each node requires two IP addresses, and in addition, three addresses are reserved for Single Client Access Names (SCANs). For the backup subnet, each node requires one address.

Tip

The Networking service reserves three IP addresses in each subnet. Allocating a larger space for the subnet than the minimum required (for example, at least /25 instead of /28) can reduce the relative impact of those reserved addresses on the subnet's available space.

Rack Size	Client Subnet: # Required IP Addresses	Client Subnet: Minimum Size	Backup Subnet: # Required IP Addresses	Backup Subnet: Minimum Size
Quarter	(2 addresses * 2 nodes) + 3 for SCANs + 3 reserved in subnet = 10	/28 (16 IP addresses)	(1 address * 2 nodes) + 3 reserved in subnet = 5	/29 (8 IP addresses)
Half	(2 * 4 nodes) + 3 + 3 = 14	/28 (16 IP addresses)	(1 * 4 nodes) + 3 = 7	/29 (8 IP addresses)
Full	(2* 8 nodes) + 3 + 3 = 22	/27 (32 IP addresses)	(1 * 8 nodes) + 3 = 11	/28 (16 IP addresses)

VCN Creation Wizard: Not for Production

The Networking section of the Console includes a handy wizard that creates a VCN along with related resources. It can be useful if you just want to try launching an instance. However, the wizard automatically chooses the address ranges and creates public subnets and an internet gateway. You may not want this for your production network, so Oracle recommends you create the VCN and other resources individually yourself instead of using the wizard.

DNS: Short Names for the VCN, Subnets, and DB System

For the nodes to communicate, the VCN must use the Internet and VCN Resolver. It enables hostname assignment to the nodes, and DNS resolution of those hostnames by resources in the VCN. It enables round robin resolution of the database's SCANs. It also enables resolution of important service endpoints required for backing up databases, patching, and updating the cloud tooling on an Exadata DB system. The Internet and VCN Resolver is the VCN's default choice for DNS in the VCN. For more information, see DNS in Your Virtual Cloud Network and also DHCP Options.

When you create the VCN, subnets, and Exadata, you must carefully set the following identifiers, which are related to DNS in the VCN:

- VCN domain label
- Subnet domain label
- Hostname prefix for the Exadata DB system

These values make up the node's fully qualified domain name (FQDN):

<hostname_prefix>-######.*<subnet_domain_label>*.*<vcn_domain_label>*.oraclevcn.com

For example:

exacs-abcde1.clientpvtad1.acmevcniad.oraclevcn.com

In this example, you assign `exacs` as the hostname prefix when you create the Exadata DB system. The Database service automatically appends a hyphen and a five-letter string with the node number at the end. For example:

- Node 1: `exacs-abcde1.clientpvtad1.acmevcniad.oraclevcn.com`
- Node 2: `exacs-abcde2.clientpvtad1.acmevcniad.oraclevcn.com`
- Node 3: `exacs-abcde3.clientpvtad1.acmevcniad.oraclevcn.com`
- And so on

Requirements for the hostname prefix:

- Maximum 12 characters
- Cannot be the string *localhost*

Requirements for the VCN and subnet domain labels:

- Recommended maximum: 14 characters each. The actual underlying requirement is a total of 28 characters *across both domain labels* (excluding the period between the labels). For example, both of these are acceptable: `subnetad1.verylongvcnphx` or `verylongsubnetad1.vcnphx`. For simplicity, the recommendation is 14 characters each.
- No hyphens.

- Recommended: include the region name in the VCN's domain label, and include the availability domain name in the subnet's domain label.

<12_chars_max>-######.*<14_chars_max>*.*<14_chars_max>*.oraclevcn.com

In general, the FQDN has a maximum total limit of 63 characters.

The preceding maximums are not enforced when you create the VCN and subnets. However, if the labels exceed the maximum, the Exadata deployment fails.

DNS: Between On-Premises Network and VCN

To enable the use of hostnames when on-premises hosts and VCN resources communicate with each other, you have two options:

- Set up an instance in the VCN to be a custom DNS server. For an example of an implementation of this scenario with the Oracle Terraform provider, see Hybrid DNS Configuration.
- Manage hostname resolution yourself manually.

Node Access to Object Storage: Static Route

Access to Oracle Cloud Infrastructure Object Storage is required for backing up databases, patching, and updating the cloud tooling on an Exadata DB system. Regardless of how you set up the VCN with that access (for example, with a service gateway), you must configure a static route to Object Storage on each of the compute nodes in the cluster. This is required because, by default, all traffic in an Exadata DB system is routed through the data network. You need the traffic destined for Object Storage to be routed instead through the backup interface (BONDETH1).

Important

You must configure a static route for Object Storage access *on each compute node* in an Exadata DB system. Otherwise, attempts to back up databases, patch, or update tooling on the system might fail.

Object Storage IP allocations

Oracle Cloud Infrastructure Object Storage uses the CIDR block IP range 134.70.0.0/17 for all regions. This range was introduced in April and May of 2018.

As of June 1, 2018, Object Storage no longer supports the following discontinued IP ranges. Oracle recommends that you remove these older IP addresses from your access-control lists, firewall rules, and other rules after you have adopted the new IP ranges.

The **discontinued** IP ranges are:

- eu-frankfurt-1: 130.61.0.0/16
- uk-london-1: 132.145.0.0/16
- us-ashburn-1: 129.213.0.0/16
- us-phoenix-1: 129.146.0.0/16

To configure a static route for Object Storage access

1. SSH to a compute node in the Exadata DB system.

   ```
   ssh -i <private_key_path> opc@<node_ip_address>
   ```

2. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the root user's profile.

   ```
   login as: opc

   [opc@dbsys ~]$ sudo su -
   ```

3. Identify the gateway configured for the BONDETH1 interface.

   ```
   [root@dbsys ~]# grep GATEWAY /etc/sysconfig/network-scripts/ifcfg-bondeth1 |awk -F"=" '{print
   $2}'

   10.0.4.1
   ```

4. Add the following static rule for BONDETH1 to the `/etc/sysconfig/network-scripts/route-bondeth1` file:

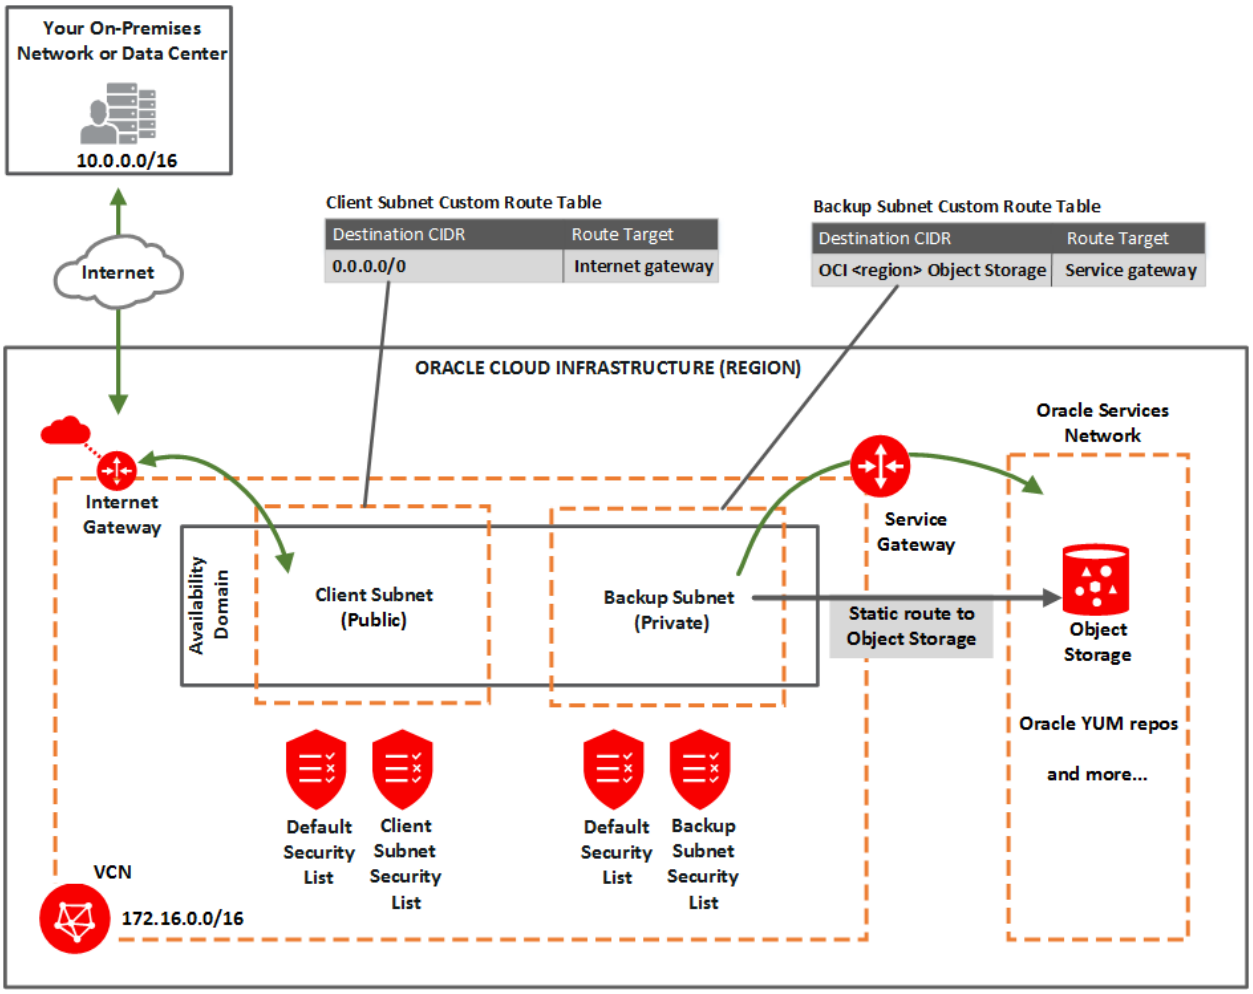
```
10.0.X.0/XX dev bondeth1 table 211
default via <gateway> dev bondeth1 table 211
134.70.0.0/17 via <gateway_from_previous_step> dev bondeth1
```

5. Restart the interface.

   ```
   [root@dbsys ~]# ifdown bondeth1; ifup bondeth1;
   ```

   The file changes from the previous step take effect immediately after the ifdown and ifup commands run.

6. Repeat the preceding steps on *each* compute node in the Exadata DB system.



Service Gateway for the VCN

Your VCN needs access to both Object Storage for backups and Oracle YUM repos for OS updates.

Depending on whether you use option 1 or option 2 described previously, you use the service gateway in different ways. See the next two sections.

Option 1: Service Gateway Access Only to Object Storage

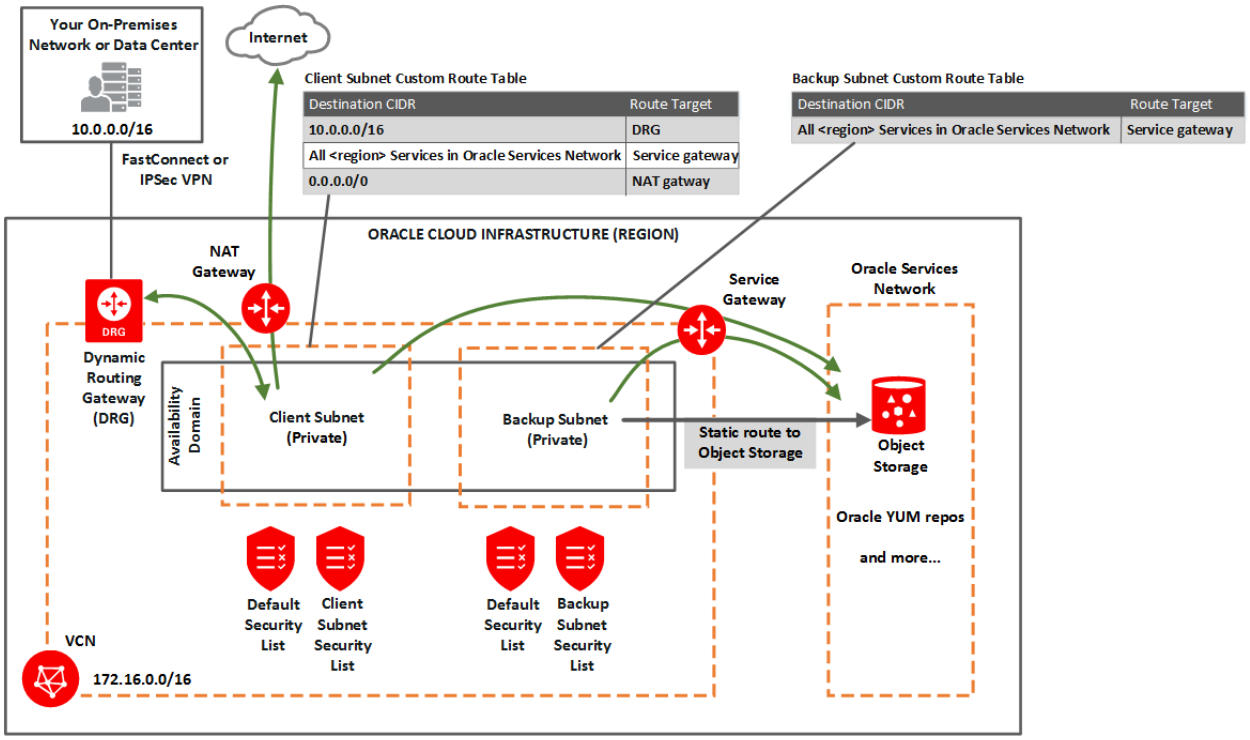
You configure the *backup subnet* to use the service gateway for access only to Object Storage. As a reminder, here's the diagram for option 1:

In general, you must:

- Perform the tasks for setting up a service gateway on a VCN, and specifically enable the service CIDR label called **OCI *<region>* Object Storage**.
- In the task for updating routing, add a route rule to the *backup* subnet's custom route table. For the destination service, use **OCI *<region>* Object Storage** and target = the service gateway.

- In the optional task for updating security lists in the subnet, perform the task on the *backup* subnet's custom security list. Set up a security list rule with the destination service set to **OCI *<region>* Object Storage**. See Rule for Backup Subnet's Custom Security List.

Option 2: Service Gateway Access to Both Object Storage and YUM Repos



You configure *both the client subnet and backup subnet* to use the service gateway for access to the Oracle Services Network, which includes both Object Storage and the Oracle YUM repos.

Important

See this known issue for information about accessing Oracle YUM services through the service gateway.

As a reminder, here's the diagram for option 2:

In general, you must:

- Perform the tasks for setting up a service gateway on a VCN, and specifically enable the service CIDR label called **All *<region>* Services in Oracle Services Network**.
- In the task for updating routing in each subnet, add a rule to each subnet's custom route table. For the destination service, use **All *<region>* Services in Oracle Services Network** and target = the service gateway.
- In the optional task for updating security lists in the subnet, perform the task on the *backup* subnet's custom security list. Set up a security list rule with the destination service set to **OCI *<region>* Object Storage**. See Rule for Backup Subnet's Custom Security List. Note that the client subnet already has a broad egress rule that covers access to the YUM repos.

Here are a few additional details about using the service gateway for option 2:

- Both the client subnet and backup subnet use the service gateway, but to access different services. You cannot enable both the **OCI *<region>* Object Storage** service CIDR label and the **All *<region>* Services in Oracle Services Network** for the service gateway. To cover the needs of both subnets, you must enable **All *<region>* Services in Oracle Services Network** for the service gateway. The VCN can have only a single service gateway.
- Any route rule that targets a given service gateway must use an enabled service CIDR label and not a CIDR block as the destination for the rule. That means for option 2, the route tables for both subnets must use **All *<region>* Services in Oracle Services Network** for their service gateway rules.
- Unlike route rules, security list rules can use either *any* service CIDR label (whether the VCN has a service gateway or not) or a CIDR block as the source or destination CIDR for the rule. Therefore, although the backup subnet has a route rule that uses **All *<region>* Services in Oracle Services Network**, the subnet can have a security list rule that uses **OCI *<region>* Object Storage**. See Rule for Backup Subnet's Custom Security List.

Security Lists for the Subnets

Oracle recommends that you use at least two security lists with each of the subnets.

For the client subnet:

- VCN's default security list (with all its default rules). **This security list contains several basic rules that are necessary for the DB system (such as ingress SSH access to the DB system, and general egress from the DB system).**
- Custom security list specifically for the client subnet (see Rules for Client Subnet's Custom Security List).

For the backup subnet:

- VCN's default security list (with all its default rules).
- Custom security list specifically for the backup subnet (see Rule for Backup Subnet's Custom Security List).

You must create the two custom security lists yourself. The VCN's default security list is automatically created when you create the VCN. When you create a subnet, you can choose which security lists the subnet will use, or you can choose the security lists after the subnet is created.

Warning

Do not remove the default egress rule from the default security list. If you do, make sure to instead include a replacement egress rule in the client subnet's security list, like so:

- **Stateless:** No (all rules must be stateful)
- **Destination Type:** CIDR
- **Destination CIDR:** 0.0.0.0/0
- **IP Protocol:** All

Rules for Client Subnet's Custom Security List

Create the following security list rules in the client subnet's custom security list and associate the security list with the client subnet.

Ingress rule 1: Allows ONS and FAN traffic from within the client subnet

The first rule is recommended and enables the Oracle Notification Services (ONS) to communicate about Fast Application Notification (FAN) events.

- **Stateless:** No (all rules must be stateful)
- **Source Type:** CIDR

- **Source CIDR:** Client subnet's CIDR
- **IP Protocol:** TCP
- **Source Port Range:** All
- **Destination Port Range:** 6200

Ingress rule 2: Allows SQL*NET traffic from within the client subnet

This rule is for SQL*NET traffic and is required in these cases:

- If you need to enable client connections to the database
- If you plan to use Oracle Data Guard

- **Stateless:** No (all rules must be stateful)
- **Source Type:** CIDR
- **Source CIDR:** Client subnet's CIDR
- **IP Protocol:** TCP
- **Source Port Range:** All
- **Destination Port Range:** 1521

Important

The two preceding rules only cover connections initiated from within the client subnet. If you have a client that resides *outside the VCN*, Oracle recommends setting up two *additional* similar rules that instead have the **Source CIDR** set to the public IP address of the client.

The next four rules (two ingress, two egress) allow TCP and ICMP traffic inside the client subnet and enable the nodes to communicate with each other. If TCP connectivity fails across the nodes, the Exadata DB system fails to provision.

Ingress rule 3: Allows all TCP traffic inside the client subnet

- **Stateless:** No (all rules must be stateful)
- **Source Type:** CIDR
- **Source CIDR:** Client subnet's CIDR
- **IP Protocol:** TCP
- **Source Port Range:** All
- **Destination Port Range:** All

Ingress rule 4: Allows all ICMP traffic inside the client subnet

- **Stateless:** No (all rules must be stateful)
- **Source Type:** CIDR
- **Source CIDR:** Client subnet's CIDR
- **IP Protocol:** ICMP
- **Type and Code:** All

Egress rule 1: Allows all TCP traffic inside the client subnet

- **Stateless:** No (all rules must be stateful)
- **Destination Type:** CIDR
- **Destination CIDR:** Client subnet's CIDR
- **IP Protocol:** TCP
- **Source Port Range:** All
- **Destination Port Range:** All

Egress rule 2: Allows all ICMP traffic inside the client subnet

- **Stateless:** No (all rules must be stateful)
- **Destination Type:** CIDR
- **Destination CIDR:** Client subnet's CIDR
- **IP Protocol:** ICMP
- **Type and Code:** All

The next egress rule is redundant with the default egress rule in the default security list. It is optional but recommended in case the default security list's egress rule is inadvertently changed. The rule is important because it allows connections to the Oracle YUM repos.

Egress rule 3: Allows all egress traffic

- **Stateless:** No (all rules must be stateful)
- **Destination Type:** CIDR
- **Destination CIDR:** 0.0.0.0/0
- **IP Protocol:** All

Rule for Backup Subnet's Custom Security List

The following rule enables the DB system to communicate with Object Storage through the service gateway. It is redundant with the default egress rule in the default security list. It is optional but recommended in case the default security list's rules are inadvertently changed.

Put this rule in the backup subnet's custom security list and associate the security list with the backup subnet.

Egress rule: Allows access to Object Storage

- **Stateless:** No (all rules must be stateful)
- **Destination Type:** Service

- **Destination Service:** The service CIDR label called **OCI *<region>* Object Storage**
- **IP Protocol:** TCP
- **Source Port Range:** All
- **Destination Port Range:** 443 (HTTPS)

Managing Exadata DB Systems

This topic explains how to launch, start, stop, terminate, scale, manage licenses for, and check the status of an Exadata DB system. It also describes how to configure required access to the Oracle Cloud Infrastructure Object Storage service and set up DNS.

When you launch an Exadata DB system using the Console or the API, the system is provisioned to support Oracle databases. The service creates an initial database based on the options you provide and some default options described later in this topic.

Warning

Avoid entering confidential information when assigning descriptions, tags, or friendly names to your cloud resources through the Oracle Cloud Infrastructure Console, API, or CLI.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let database admins manage database systems lets the specified group do everything with databases and related Database resources.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for databases, see Details for the Database Service.

Prerequisites

- The public key, in OpenSSH format, from the key pair that you plan to use for connecting to the DB System via SSH. A sample public key, abbreviated for readability, is shown below.

  ```
  ssh-rsa AAAAB3NzaC1yc2EAAAABJQAA....lo/gKMLVM2xzc1xJr/Hc26biw3TXWGEakrK1OQ== rsa-key-20160304
  ```

  For more information, see Managing Key Pairs on Linux Instances.
- A correctly configured virtual cloud network (VCN) to launch the DB system in. Its related networking resources (gateways, route tables, security lists, DNS, and so on) must also be configured as necessary for the DB system. For more information, see Network Setup for Exadata DB Systems.

Default Options for the Initial Database

To simplify launching a DB system in the Console and when using the API, the following default options are used for the initial database.

- **Console Enabled:** False
- **Create Container Database:** False for version 11.2.0.4 databases. Otherwise, true.
- **Create Instance Only (for standby and migration):** False
- **Database Home ID:** Creates a database home
- **Database Language:** AMERICAN
- **Database Sizing Template:** odb2
- **Database Storage:** Automatic Storage Management (ASM)
- **Database Territory:** AMERICA
- **Database Unique Name:** The user-specified database name and a system-generated suffix, for example, dbtst_phx1cs.
- **PDB Admin Name:** pdbuser (Not applicable for version 11.2.0.4 databases.)

For a list of the database options that you can set in the Console, see To launch an Exadata DB system.

Using the Console

To launch an Exadata DB system

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
3. Click **Launch DB System**.
4. In the **Launch DB System** dialog, enter the following:

   DB System Information

   - **Compartment:** By default, the DB system launches in your current compartment and you can use the network resources in that compartment. Click the **click here** link in the dialog box if you want to enable compartment selection for the DB system, network, and subnet resources.
   - **Display Name:** A friendly, display name for the DB system. The name doesn't need to be unique. An Oracle Cloud Identifier (OCID) will uniquely identify the DB system.
   - **Availability Domain:** The availability domain in which the DB system resides.
   - **Shape Type:** The type of shape to use to launch the DB system. The shape type filters the list of available shapes to select from.
   - **Shape:** The shape to use to launch the DB system. The shape determines the type of DB system and the resources allocated to the system.

     ### Exadata shapes

     Exadata X6 shapes:

     - **Exadata.Quarter1.84:** Provides a 2-node Exadata DB system with 22 enabled CPU cores, with up to 62 additional CPU cores, and 84 TB of usable storage.

- **Exadata.Half1.168:** Provides a 4-node Exadata DB system with 44 enabled CPU cores, with up to 124 additional CPU cores, and 168 TB of usable storage.
- **Exadata.Full1.336:** Provides an 8-node Exadata DB system with 88 enabled CPU cores, with up to 248 additional CPU cores, and 336 TB of usable storage.

Exadata X7 shapes:

- **Exadata.Quarter2.92:** Provides a 2-node Exadata DB system with up to 92 CPU cores, and 106 TB of usable storage.
- **Exadata.Half2.184:** Provides a 4-node Exadata DB system with up to 184 CPU cores, and 212 TB of usable storage.
- **Exadata.Full2.368:** Provides an 8-node Exadata DB system with up to 368 CPU cores, and 424 TB of usable storage.

All Exadata shapes provide 720 GB RAM per node and unlimited I/O, and support only Enterprise Edition - Extreme Performance. For more details about Exadata shapes, see System Configuration.

- **Cluster Name:** A unique cluster name for a multi-node DB system. The name must begin with a letter and contain only letters (a-z and A-Z), numbers (0-9) and hyphens (-). The cluster name can be no longer than 11 characters and is not case sensitive.
- **Total Node Count:** The number of nodes in the DB system. The number depends on the shape you select.
- **Oracle Database Software Edition:** The database edition supported by the DB system. For bare metal systems, you can mix supported database releases on the DB system to include older database versions, but not editions. The database edition cannot be changed and applies to all the databases in this DB system. Virtual machine systems support only one database.
- **CPU Core Count:** The number of CPU cores for the DB system. Displays only if

you select a shape that allows you to configure the number of cores. The text below the field indicates the acceptable values for that shape. For a multi-node DB system, the core count is evenly divided across the nodes.

You can increase the CPU cores to accommodate increased demand after you launch the DB system.

For an Exadata X7 DB system, you can specify zero (0) cores when you launch the system. This will provision the system and immediately stop it. See Scaling Within an Exadata System for information about CPU core scaling and the impact on billing.

- **License Type:** The type of license you want to use for the DB system. Your choice affects metering for billing.
  - **License included** means the cost of the cloud service includes a license for the Database service.
  - **Bring Your Own License (BYOL)** means you are an Oracle Database customer with an Unlimited License Agreement or Non-Unlimited License Agreement and want to use your license with Oracle Cloud Infrastructure. This removes the need for separate on-premises licenses and cloud licenses.
- **SSH Public Key:** The public key portion of the key pair you want to use for SSH access to the DB system. To provide multiple keys, paste each key on a new line. Make sure each key is on a single, continuous line. The length of the combined keys cannot exceed 10,000 characters.
- **Storage Allocation:** The configuration settings that determine the percentage of storage assigned to DATA, RECO, and optionally, SPARSE disk:
  - **Database Backups on Exadata Storage:** Select this option if you intend to perform database backups to the local Exadata storage within your Exadata DB system environment. If you select this option, more space is allocated to the RECO disk group, which is used to store backups on Exadata storage. If you do not select this option, more space is allocated to the DATA disk group, which enables you to store more information in your

databases.

- **Create Sparse Disk Group:** Select this configuration option if you intend to use snapshot functionality within your Exadata DB system environment. If you select this option, the SPARSE disk group is created, which enables you to use Exadata DB system snapshot functionality for PDB sparse cloning. If you do not select this option, the SPARSE disk group is not created and Exadata DB system snapshot functionality will not be available on any database deployments that are created in the environment.

Important

Creating a sparse disk group impacts the storage available for the ASM disk groups (DATA and RECO) and you cannot change the storage allocation configuration after you provision your DB system. For information about the percentage of storage that will be assigned to DATA, RECO, and SPARSE disk based on your configuration, see Impact of Configuration Settings on Storage. Similar information will display under the options in the Console dialog.

- **Disk Redundancy:** *(Available when you select Show Advanced Options)* The type of redundancy configured for the DB system.
  - **Normal** is 2-way mirroring, recommended for test and development systems. This option is not available for Exadata DB systems.
  - **High** is 3-way mirroring, recommended for production systems.
- **Time Zone:** *(Available when you select Show Advanced Options)* The default time zone for the DB system is UTC, but you can specify a different time zone. The

time zone options are those supported in both the Java.util.TimeZone class and the Oracle Linux operating system. For more information, see DB System Time Zone.

Tip

If you want to set a time zone other than UTC or the browser-detected time zone and if you do not see the time zone you are interested in, try selecting "Miscellaneous" as the time zone prefix.

NETWORK INFORMATION

- **Virtual Cloud Network Compartment:** The compartment containing the network in which to launch the DB system.
- **Virtual Cloud Network:** The VCN in which to launch the DB system.
- **Subnet Compartment:** The compartment containing a subnet within the cloud network to attach the DB system to.
- **Client Subnet:** The subnet to which the Exadata DB system should attach.
  Do not use a subnet that overlaps with 192.168.128.0/20. This restriction applies to both the client subnet and backup subnet.
- **Backup Subnet:** The subnet to use for the backup network , which is typically used to transport backup information to and from Oracle Cloud Infrastructure Object Storage, and for Data Guard replication.
  Do not use a subnet that overlaps with 192.168.128.0/20. This restriction applies to both the client subnet and backup subnet.
  If you plan to back up databases to Object Storage, see the network prerequisites in Backing Up an Exadata Database.

- **Hostname Prefix:** Your choice of host name for the Exadata DB system. The host name must begin with an alphabetic character, and can contain only alphanumeric characters and hyphens (-). The maximum number of characters allowed for an Exadata DB system is 12.

  Important

  The host name must be unique within the subnet. If it is not unique, the DB system will fail to provision.

- **Host Domain Name:** The domain name for the DB system. If the selected subnet uses the Oracle-provided Internet and VCN Resolver for DNS name resolution, this field displays the domain name for the subnet and it can't be changed. Otherwise, you can provide your choice of a domain name. Hyphens (-) are not permitted.

  If you plan to store database backups in Object Storage, Oracle recommends using a VCN Resolver for DNS name resolution for the client subnet as it automatically resolves the Swift endpoints used for backups.
- **Host and Domain URL:** Combines the host and domain names to display the fully qualified domain name (FQDN) for the database. The maximum length is 64 characters.

DATABASE INFORMATION

- **Database Name:** The name for the database. The database name must begin with an alphabetic character and can contain a maximum of eight alphanumeric characters. Special characters are not permitted.
- **Database Version:** The version of the initial database created on the DB system when it is launched. After the DB system is active, you can create additional databases on it. You can mix database versions on the DB system, but not

editions.

- **PDB Name:** *Not applicable to version 11.2.0.4.* The name of the pluggable database. The PDB name must begin with an alphabetic character, and can contain a maximum of 8 alphanumeric characters. The only special character permitted is the underscore (_).
- **Database Admin Password:**
  A strong password for SYS, SYSTEM, TDE wallet, and PDB Admin. The password must be 9 to 30 characters and contain at least 2 uppercase, 2 lowercase, 2 numeric, and 2 special characters. The special characters must be _, #, or -. The password must not contain the username (SYS, SYSTEM, and so on) or the word "oracle" either in forward or reversed order and regardless of casing.
- **Confirm Database Admin Password:** Re-enter the Database Admin Password you specified.
- **Database Workload:**
  Select the workload type that best suits your application.
  - **Online Transactional Processing (OLTP)** configures the database for a transactional workload, with a bias towards high volumes of random data access.
  - **Decision Support System (DSS)** configures the database for a decision support or data warehouse workload, with a bias towards large data scanning operations.
- **Character Set:** The character set for the database. The default is AL32UTF8.
- **National Character Set:** The national character set for the database. The default is AL16UTF16.
- **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your

administrator.

5. Click **Launch DB System**.
   The DB system appears in the list with a status of Provisioning. The DB system's icon changes from yellow to green (or red to indicate errors).
6. Wait for the DB system's icon to turn green, with a status of Available, and then click the highlighted DB system name.
   Details about the DB system are displayed.

Note

An X7 Exadata DB system launched with zero cores will be in a Stopped state until you scale it up.

7. Note the IP addresses; you'll need the private or public IP address, depending on network configuration, to connect to the DB system.

To check the status of an Exadata DB system

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB systems, find the system you're interested in and check its icon. The color of the icon and the text below it indicates the status of the system.
   - **Provisioning:** Yellow icon. Resources are being reserved for the DB system, the system is booting, and the initial database is being created. Provisioning can take several minutes. The system is not ready to use yet.
   - **Available:** Green icon. The DB system was successfully provisioned. A few minutes after the system enters this state, you can SSH to it and begin using it.

- **Terminating:** Gray icon. The DB system is being deleted by the terminate action in the Console or API.
- **Terminated:** Gray icon. The DB system has been deleted and is no longer available.
- **Failed:** Red icon. An error condition prevented the provisioning or continued operation of the DB system.

To view the status of a database node, under Resources, click **Nodes** to see the list of nodes. In addition to the states listed for a DB system, a node's status can be one of the following:

- **Starting:** Yellow icon. The database node is being powered on by the start or reboot action in the Console or API.
- **Stopping:** Yellow icon. The database node is being powered off by the stop or reboot action in the Console or API.
- **Stopped:** Yellow icon. The database node was powered off by the stop action in the Console or API.

You can also check the status of DB systems and database nodes using the ListDbSystems or ListDbNodes API operations, which return the `lifecycleState` attribute.

To start, stop, or reboot an Exadata DB system

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB systems, find the DB system you want to stop or start, and then click its name to display details about it.
4. In the list of nodes, click the Actions icon (three dots) for a node and then click one of the following actions:
   - **Start:** Restarts a stopped node. After the node is restarted, the **Stop** action is enabled.

- **Stop:** Shuts down the node. After the node is powered off, the **Start** action is enabled.
- **Reboot:** Shuts down the node, and then restarts it.

Note

- For billing purposes, the **Stop** state has no effect on the resources you consume. Billing continues for nodes that you stop, and related resources continue to apply against any relevant quotas. You must **Terminate** a DB system to remove its resources from billing and quotas.
- After you restart or reboot a node, the floating IP address might take several minutes to be updated and display in the Console.

To scale an Exadata DB system

If an Exadata DB system requires more compute node processing power, you can scale up (burst) the number of enabled CPU cores in the system.

You can also scale an X7 Exadata DB system down to zero CPU cores to temporarily stop the system and be charged only for the hardware infrastructure. For more information about scaling down, see Scaling Within an Exadata System.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB systems, find the system you want to scale and click its highlighted

name.
The system details are displayed.

4. Click **Scale Up/Down** and then change the number in **Total CPU Core Count**. The text below the field indicates the acceptable values, based on the shape used when the DB system was launched.
5. Click **Scale Up/Down DB System**.

Note

If you scale an X7 Exadata DB system down to zero CPU cores, the floating IP address of the nodes might take several minutes to be updated and display in the Console.

To terminate an Exadata DB system

Terminating a DB system permanently deletes it and any databases running on it.

Note

The database data is local to the DB system and is lost when the system is terminated. Oracle recommends that you back up any data in the DB system before terminating it.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
A list of DB systems is displayed.

3. For the DB system you want to terminate, click the Actions icon (three dots), and then click **Terminate**.
4. Confirm when prompted.
   The DB system's icon indicates Terminating.

At this point, you cannot connect to the system and any open connections are terminated.

To manage your BYOL database licenses

If you want to control the number of database licenses that you run at any given time, you can scale up or down the number of OCPUs on the instance. These additional licenses are metered separately.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB systems, find the system you want to scale and click its highlighted name.
   The system details are displayed.
4. Click **Scale Up/Down OCPU** and then change the number.

To manage tags for your DB systems and database resources

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Find the DB system or database resource you're interested in, and click the name.
4. Click the **Tags** tab to view or edit the existing tags. Or click **Apply Tag(s)** to add new tags.

For more information, see Resource Tags.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage DB system components.

DB systems:

- GetDbSystem
- LaunchDbSystem
- ListDbSystems
- TerminateDbSystem

Database homes:

- GetDbHome
- ListDbHomes

Databases:

- GetDatabase
- ListDatabases

Nodes:

- DbNodeAction: Use this operation to power cycle a node in the DB system.
- ListDbNodes
- GetDbNode

Shapes and database versions:

- ListDbSystemShapes
- ListDbVersions

Configuring a Static Route for Accessing the Object Store

All the traffic in an Exadata DB system is, by default, routed through the data network. To route backup traffic to the backup interface (BONDETH1), you need to configure a static route on *each* of the compute nodes in the cluster. For instructions, see Node Access to Object Storage: Static Route.

Setting Up DNS for a DB System

DNS lets you use hostnames instead of IP addresses to communicate with a DB system. You can use the *Internet and VCN Resolver* (the DNS capability built into the VCN) as described in DNS in Your Virtual Cloud Network. Oracle recommends using a VCN Resolver for DNS name resolution for the client subnet. It automatically resolves the Swift endpoints required for backing up databases, patching, and updating the cloud tooling on an Exadata DB system.

Managing Exadata DB System I/O Resources

This topic explains the I/O Resource Management (IORM) feature and how to enable it, modify the IORM settings, and disable it by using the Console.

About IORM

The I/O Resource Management (IORM) feature allows you to manage how multiple databases share the I/O resources of an Oracle Exadata DB system.

On an Exadata DB system, all databases share dedicated storage servers which include flash storage. By default, the databases are given equal priority with respect to these resources. The Exadata storage management software uses a first come, first served approach for query processing. If a database executes a major query that overloads I/O resources, overall system performance can be slowed down.

IORM allows you to assign priorities to your databases to ensure critical queries are processed first when workloads exceed their resource allocations. You assign priorities by creating directives that specify the number of shares for each database. The number of shares corresponds to a percentage of resources given to that database when I/O resources are stressed.

Directives work together with an overall optimization objective you set for managing the resources. The following objectives are available:

- **Auto** - Recommended. IORM determines the optimization objective and continuously and dynamically determines the optimal settings, based on the workloads observed, and resource plans enabled.
- **Balanced** - For critical OLTP and DSS workloads. This setting balances low disk latency and high throughput. This setting limits disk utilization of large I/Os to a lesser extent than low latency to achieve a balance between good latency and good throughput.
- **High throughput** - For critical DSS workloads that require high throughput.
- **Low latency** - For critical OLTP workloads. This setting provides the lowest possible latency by significantly limiting disk utilization.

For more information about IORM, see Exadata System Software User's Guide.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let database admins manage database systems lets the specified group do everything with databases and related Database resources.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for databases, see Details for the Database Service.

Using the Console

To enable IORM on your Exadata DB system

Enabling IORM includes specifying an optimization objective and configuring your resource

plan directives.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
3. In the list of DB systems, find the Exadata DB system for which you want to enable IORM, and click its highlighted name.
   The system details are displayed, showing the IORM status as "Disabled."
4. Cick **Enable IORM**.
   It might take a minute for the Enable I/O Resource Management dialog to retrieve the DB system information.
5. Select the objective to apply to the resource plan:
   - **Auto** - (Recommended) Dynamically changes the objective based on the resource plan and observed workloads.
   - **Balanced** - Weighs high throughput and low latency evenly.
   - **High throughput** - Provides the best throughput for DSS workloads.
   - **Low latency** - Provides the best latency for critical OLTP workloads.
6. Configure the resource plan default directive by setting the number of shares. This number of shares is assigned to each database not associated with a specific directive.
7. In the Resource Plan Directives section, add a directive for each database you want to assign a greater or lesser number of shares than the default directive.
   To add a directive, click **+ Additional Directive**, then specify the database and the number of shares for that database.
8. When you are done adding directives, click **Enable**.
   While the IORM configuration settings are being applied, the system details page shows the IORM status as "Updating." The update might take several minutes to complete but should have no impact on your ability to perform normal operations on your DB system. After a successful update, the IORM status shows as "Enabled."

To modify the IORM configuration on your Exadata DB system

Use this procedure to change your IORM settings or to disable IORM.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
3. In the list of DB systems, find the Exadata DB system for which you want to modify the IORM configuration, and click its highlighted name.
   The system details are displayed, showing the IORM status as "Enabled."
4. Click **Update IORM**.
5. In the Update I/O Resource Management dialog, take one of the following actions:
   - Change your settings - Specify a new objective and adjust your directives, as applicable, and then click **Update**.
   - Disable IORM - Click **Disable IORM**. Disabling IORM removes all your resource plan directives and restores a basic objective for I/O resource management.

   While the new IORM configuration settings are being applied, the system details page shows the IORM status as "Updating." The update might take several minutes to complete but should have no impact on your ability to perform normal operations on your DB system. After a successful update, the IORM status shows as "Enabled" or "Disabled," depending on the action you took.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage the I/O resources of your Exadata DB system.

- ListDbSystems
- GetDbSystem
- GetExadataIormConfig
- UpdateExadataIormConfig

Connecting to an Exadata DB System

This topic explains how to connect to an Exadata DB System using SSH or SQL Developer. How you connect depends on how your cloud network is set up. You can find information on various networking scenarios in Overview of Networking, but for specific recommendations on how you should connect to a database in the cloud, contact your network security administrator.

Prerequisites

For SSH access to a compute node in an Exadata DB System, you'll need the following:

- The full path to the file that contains the private key associated with the public key used when the system was launched.
- The public or private IP address of the DB System. Use the private IP address to connect to the DB system from your on-premises network, or from within the virtual cloud network (VCN). This includes connecting from a host located on-premises connecting through a VPN or FastConnect to your VCN, or from another host in the same VCN. Use the DB System's public IP address to connect to the system from outside the cloud (with no VPN). You can find the IP addresses in the Oracle Cloud Infrastructure Console on the **Database** page.

Connecting to a Compute Node with SSH

You can connect to the compute nodes in an Exadata DB System by using a Secure Shell (SSH) connection. Most UNIX-style systems (including Linux, Solaris, BSD, and OS X) include an SSH client by default. For Windows, you can download a free SSH client called PuTTY from http://www.putty.org.

To connect from a UNIX-style system

Use the following SSH command to access a compute node:

```
$ ssh -i <private key> opc@<DB System IP address>
```

<private key> is the full path and name of the file that contains the private key associated with the Exadata DB System you want to access.

Use the private or public IP address depending on your network configuration. For more information, see Prerequisites.

To connect from a Windows system

1. Open `putty.exe`.
2. In the **Category** pane, select **Session** and enter the following fields:
   - **Host Name (or IP address):** `opc@`*`<ip_address>`*
     Use the compute node's private or public IP address depending on your network configuration. For more information, see Prerequisites.
   - **Connection type:** SSH
   - **Port:** 22
3. In the **Category** pane, expand **Connection**, expand **SSH**, and then click **Auth**, and browse to select your private key.
4. Optionally, return to the **Session** category screen and save this session information for reuse later.
5. Click **Open** to start the session.

To access a database after you connect to the compute node

1. Log in as opc and then sudo to the root user.

```
login as: opc

[opc@ed1db01 ~]$ sudo su -
```

2. Set the environment to the ASM instance. Depending on which node you are connecting to, the ASM instance ID will vary, for example, +ASM1 , +ASM2, and so on.

```
[root@ed1db01 ]# . oraenv
ORACLE_SID = [root] ? +ASM1
The Oracle base has been set to /u01/app/grid
```

3. List the databases on the system.

```
root@ed1db01 ]# srvctl config database -v

cdbm01 /u02/app/oracle/product/12.1.0/dbhome_2 12.1.0.2.0
exadb /u02/app/oracle/product/11.2.0/dbhome_2 11.2.0.4.0
mmdb /u02/app/oracle/product/12.1.0/dbhome_3 12.1.0.2.0
```

4. Connect as the oracle user and get the details about one of the databases using srvctl command.

```
[root@ed1db01 ~]# su - oracle
[oracle@ed1db01 ~]$ . oraenv
ORACLE_SID = [oracle] ? cdbm01
The Oracle base has been set to /u02/app/oracle
[oracle@ed1db01 ~]$ srvctl config database -d cdbm01
Database unique name: cdbm01 <<== DB unique name
Database name:
Oracle home: /u02/app/oracle/product/12.1.0/dbhome_2
Oracle user: oracle
Spfile: +DATAC1/cdbm01/spfilecdbm01.ora
Password file: +DATAC1/cdbm01/PASSWORD/passwd
Domain: data.customer1.oraclevcn.com
Start options: open
Stop options: immediate
Database role: PRIMARY
Management policy: AUTOMATIC
Server pools:
Disk Groups: DATAC1,RECOC1
Mount point paths:
Services:
Type: RAC
Start concurrency:
Stop concurrency:
OSDBA group: dba
OSOPER group: racoper
Database instances: cdbm011,cdbm012 <<== SID
```

```
Configured nodes: ed1db01,ed1db02
Database is administrator managed
```

Connecting to a Database with SQL Developer

You can connect to a database with SQL Developer by using one of the following methods:

- Create a temporary SSH tunnel from your computer to the database. This method provides access only for the duration of the tunnel. (When you are done using the database, be sure to close the SSH tunnel by exiting the SSH session.)
- Open port 1521 for the Oracle default listener by updating the security list used for the DB System. This method provides more durable access to the database. For more information, see Updating the Security List.

After you've created an SSH tunnel or opened port 1521 as described above, you can connect to a Exadata DB System using SCAN IP addresses or public IP addresses, depending on how your network is set up and where you are connecting from. You can find the IP addresses in the Console, in the **Database** details page.

To connect using SCAN IP addresses

You can connect to the database using the SCAN IP addresses if your client is on-premises and you are connecting using a FastConnect or VPN connection. You have the following options:

- Use the private SCAN IP addresses, as shown in the following `tnsnames.ora` example:

```
testdb=
  (DESCRIPTION =
    (ADDRESS_LIST=
      (ADDRESS = (PROTOCOL = TCP)(HOST = <scanIP1>)(PORT = 1521))
      (ADDRESS = (PROTOCOL = TCP)(HOST = <scanIP2>)(PORT = 1521)))
    (CONNECT_DATA =
      (SERVER = DEDICATED)
      (SERVICE_NAME = <dbservice.subnetname.dbvcn.oraclevcn.com>)
    )
  )
```

- Define an external SCAN name in your on-premises DNS server. Your application can resolve this external SCAN name to the DB System's private SCAN IP addresses, and then the application can use a connection string that includes the external SCAN name. In the following `tnsnames.ora` example, `extscanname.example.com` is defined in the on-premises DNS server.

```
testdb =
  (DESCRIPTION =
    (ADDRESS = (PROTOCOL = TCP)(HOST = <extscanname.example.com>)(PORT = 1521))
    (CONNECT_DATA =
      (SERVER = DEDICATED)
      (SERVICE_NAME = <dbservice.subnetname.dbvcn.oraclevcn.com>)
    )
  )
```

To connect using public IP addresses

You can use the node's public IP address to connect to the database if the client and database are in different VCNs, or if the database is on a VCN that has an internet gateway. However, there are important implications to consider:

- When the client uses the public IP address, the client bypasses the SCAN listener and reaches the node listener, so server side load balancing is not available.
- When the client uses the public IP address, it cannot take advantage of the VIP failover feature. If a node becomes unavailable, new connection attempts to the node will hang until a TCP/IP timeout occurs. You can set client side sqlnet parameters to limit the TCP/IP timeout.

The following `tnsnames.ora` example shows a connection string that includes the CONNECT_TIMEOUT parameter to avoid TCP/IP timeouts.

```
test=
  (DESCRIPTION =
    (CONNECT_TIMEOUT=60)
    (ADDRESS_LIST=
      (ADDRESS = (PROTOCOL = TCP)(HOST = <publicIP1>)(PORT = 1521))
```

```
      (ADDRESS = (PROTOCOL = TCP)(HOST = <publicIP2>)(PORT = 1521))
    )
    (CONNECT_DATA =
      (SERVER = DEDICATED)
      (SERVICE_NAME = <dbservice.subnetname.dbvcn.oraclevcn.com>)
    )
  )
```

Updating an Exadata DB System

This topic covers how to update the operating system and the tooling on the database server nodes (also known as "compute nodes") of an Exadata DB system. Review all of the information carefully before you begin the updates.

OS Updates

Important

Starting on March 14, 2019, Exadata DB system images run Oracle Linux 7 (OL7). Previously launched systems are running Oracle Linux 6 (OL6). The underlying infrastructure of existing Exadata DB systems will be patched in the April 2019 time frame. This patch will allow you to upgrade the DB system operating system to OL7.

After you receive notification that your infrastructure patch update is complete, follow the instructions in Patching an Exadata DB System to patch the Oracle Grid Infrastructure and the databases, and then update the OS. Review the minimum software requirements and other details in How to update the Exadata System Software (DomU) to 19c on the Exadata Cloud Service in OCI (Doc ID 2521053.1) before you perform the OS update tasks.

You update the operating systems of Exadata compute nodes by using the `patchmgr` tool. This utility manages the entire update of one or more compute nodes remotely, including running pre-reboot, reboot, and post-reboot steps. You can run the utility from either an Exadata compute node or a non-Exadata server running Oracle Linux. The server on which you run the utility is known as the "driving system." You cannot use the driving system to update itself. Therefore, if the driving system is one of the Exadata compute nodes on a system you are updating, you must run a separate operation on a different driving system to update that server.

The following two scenarios describe typical ways of performing the updates:

Scenario 1: Non-Exadata Driving System

The simplest way to run the update the Exadata system is to use a separate Oracle Linux server to update all Exadata compute nodes in the system.

Scenario 2: Exadata Node Driving System

You can use one Exadata compute node to drive the updates for the rest of the compute nodes in the system, and then use one of the updated nodes to drive the update on the original Exadata driver node.

For example: You are updating a half rack Exadata system, which has four compute nodes - node1, node2, node3, and node4. First, use node1 to drive the updates of node2, node3, and node4. Then, use node2 to drive the update of node1.

The driving system requires root user `SSH` access to each compute node the utility will update.

PREPARING FOR THE OS UPDATES

Warning

Do not install NetworkManager on the DB system. Installing this package and rebooting the system results in severe loss of access to the system.

- Before you begin your updates, review *Exadata Cloud Service Software Versions* (Doc ID 2333222.1) to determine the latest software version and target version to use.
- Some steps in the update process require you to specify a YUM repository. The YUM repository URL is:

  ```
  http://yum-<region_key>.oracle.com/repo/EngineeredSystems/exadata/dbserver/<latest_version>/base/x86_64.
  ```

  Region keys are three-letter abbreviations, for example PHX.
  You can run the following `curl` command to determine the latest version of the YUM repository for your DB system region:

  ```
  curl -s -X GET http://yum-<region_key>.oracle.com/repo/EngineeredSystems/exadata/dbserver/index.html |egrep "18.1."
  ```

This example returns the most current version of the YUM repository for the us-phoenix-1:

```
curl -s -X GET http://yum-phx.oracle.com/repo/EngineeredSystems/exadata/dbserver/index.html
|egrep "18.1."
<a href="18.1.4.0.0/">18.1.4.0.0/</a> 01-Mar-2018 03:36 -
```

- To apply OS updates, the DB system's VCN must be configured to allow access to the YUM repository. For more information, see Security Lists for the Subnets.

To update the OS on all compute nodes of an Exadata DB system

This example procedure assumes the following:

- The system has two compute nodes, `node1` and `node2`.
- The target version is 18.1.4.0.0.180125.3.
- Each of the two nodes is used as the driving system for the update on the other one.

1. Gather the environment details.
   a. `SSH` to `node1` as `root` and run the following command to determine the version of Exadata:

      ```
      [root@node1]# imageinfo -ver
      12.2.1.1.4.171128
      ```

   b. Switch to the grid user, and identify all computes in the cluster.

      ```
      [root@node1]# su - grid
      [grid@node1]$ olsnodes
      node1
      node1
      ```

2. Configure the driving system.
   a. Switch back to the root user on `node1`, check whether a root ssh key pair (`id_rsa` and `id_rsa.pub`) already exists. If not, then generate it.

      ```
      [root@node1 .ssh]#  ls /root/.ssh/id_rsa*
      ls: cannot access /root/.ssh/id_rsa*: No such file or directory
      [root@node1 .ssh]# ssh-keygen -t rsa
      ```

```
Generating public/private rsa key pair.
Enter file in which to save the key (/root/.ssh/id_rsa):
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /root/.ssh/id_rsa.
Your public key has been saved in /root/.ssh/id_rsa.pub.
The key fingerprint is:
93:47:b0:83:75:f2:3e:e6:23:b3:0a:06:ed:00:20:a5
root@node1.fraad1client.exadataclientne.oraclevcn.com
The key's randomart image is:
+--[ RSA 2048]----+
|o..     + .      |
|o.     o *       |
|E     . o o      |
| . .     =       |
|  o .   S =      |
|   +     = .     |
|    +   o o      |
|   . .   + .     |
|      ...        |
+-----------------+
```

b. Distribute the public key to the target nodes, and verify this step. In this example, the only target node is `node2`.

```
[root@node1 .ssh]# scp -i ~opc/.ssh/id_rsa ~root/.ssh/id_rsa.pub opc@node2:/tmp/id_
rsa.node1.pub
id_rsa.pub

[root@node2 ~]# ls -al /tmp/id_rsa.node1.pub
-rw-r--r-- 1 opc opc 442 Feb 28 03:33 /tmp/id_rsa.node1.pub
[root@node2 ~]# date
Wed Feb 28 03:33:45 UTC 2018
```

c. On the target node (`node2`, in this example), add the root public key of `node1` to the root `authorized_keys` file.

```
[root@node2 ~]# cat /tmp/id_rsa.node1.pub >> ~root/.ssh/authorized_keys
```

d. Download `dbserver.patch.zip` as `p21634633_12*_Linux-x86-64.zip` onto the driving system (`node1`, in this example), and unzip it. See *dbnodeupdate.sh and*

dbserver.patch.zip: Updating Exadata Database Server Software using the DBNodeUpdate Utility and patchmgr (Doc ID 1553103.1) for information about the files in this .zip.

```
[root@node1 patch]# mkdir /root/patch
[root@node1 patch]# cd /root/patch
[root@node1 patch]# unzip p21634633_181400_Linux-x86-64.zip

  inflating: dbserver_patch_5.180228.2/fwverify
```

e. Create the `dbs_group` file that contains the list of compute nodes to update. Include the nodes listed after running the `olsnodes` command in step 1 except for the driving system node. In this example, `dbs_group` should include only `node2`.

```
[root@node1 patch]# cd /root/patch/dbserver_patch_5.180228
[root@node1 dbserver_patch_5.180228]# cat dbs_group
node2
```

3. Run a patching precheck operation.

```
patchmgr -dbnodes dbs_group -precheck -yum_repo <yum_repository> -target_version <target_version>
-nomodify_at_prereq
```

Important

You must run the precheck operation with the `-nomodify_at_prereq` option to prevent any changes to the system that could impact the backup you take in the next step. Otherwise, the backup might not be able to roll back the system to its original state, should that be necessary.

The output should look like the following example:

```
[root@node1 dbserver_patch_5.180228]# ./patchmgr -dbnodes dbs_group -precheck -yum_repo
http://yum-phx.oracle.com/repo/EngineeredSystems/exadata/dbserver/18.1.4.0.0/base/x86_64 -target_
version 18.1.4.0.0.180125.3  -nomodify_at_prereq

2018-02-28 21:35:50 +0000        :SUCCESS: DONE: Initiate backup on 1 node(s).
```

5. Remove all custom RPMs from the target compute nodes that will be updated. Custom RPMs are reported in precheck results. They include RPMs that were manually installed after the system was provisioned.

Note

- If you are updating the system from version 12.1.2.3.4.170111, and the precheck results include `krb5-workstation-1.10.3-57.el6.x86_64`, remove it. (This item is considered a custom RPM for this version.)
- Do **not** remove `exadata-sun-vm-computenode-exact` or `oracle-ofed-release-guest`. These two RPMs are handled automatically during the update process.

6. Run the `nohup` command to perform the update.

```
nohup patchmgr -dbnodes dbs_group -upgrade -nobackup -yum_repo <yum_repository> -target_version
<target_version> -allow_active_network_mounts &
```

The output should look like the following example:

```
[root@node1 dbserver_patch_5.180228]# nohup ./patchmgr -dbnodes dbs_group -upgrade -nobackup  -
yum_repo  http://yum-phx.oracle.com/repo/EngineeredSystems/exadata/dbserver/18.1.4.0.0/base/x86_
64 -target_version 18.1.4.0.0.180125.3  -allow_active_network_mounts &

2018-02-28 21:57:42 +0000        :SEEMS ALREADY UP TO DATE: node2
2018-02-28 21:57:43 +0000        :SUCCESS: DONE: Initiate update on node(s)
```

7. After the update operation completes, verify the version of the kernel on the compute node that was updated.

```
[root@node2 ~]# imageinfo -ver
18.1.4.0.0.180125.3
```

8. If the driving system is a compute node that needs to be updated (as in this example), repeat steps 2 through 7 of this procedure using an updated compute node as the driving system to update the remaining compute node. In this example update, you would use `node2` to update `node1`.
9. On each compute node, run the `uptrack-install` command as root to install the available ksplice updates.

```
uptrack-install --all -y
```

Updating Tooling on an Exadata DB System

You can update the cloud-specific tooling included on an Exadata DB system compute node by downloading and applying an RPM file containing the latest version of the tools.

Note

Oracle highly recommends that you maintain the same version of cloud tooling across your Exadata DB system environment. Perform the following procedure on every compute node in the Exadata DB system.

PREREQUISITE

The compute nodes in the Exadata DB system must be configured to access the Oracle Cloud Infrastructure Object Storage service. For more information, see Node Access to Object Storage: Static Route.

UPDATING THE CLOUD TOOLING ON EACH COMPUTE NODE

The method for updating the tooling depends on the tooling release that is currently installed on the compute node. Regardless of the method you use, be sure to repeat the update process on each compute node in the cluster.

To check the installed tooling release

1. Connect to the compute node as the opc user.
2. Start a root-user command shell.

```
$ sudo -s
#
```

3. Use the following command to display information about the installed cloud tooling and note the release label, shown in red in the example that follows.

```
# rpm -qa|grep -i dbaastools_exa

dbaastools_exa-1.0-1+18.1.2.1.0_180511.0801.x86_64
```

In this example, the release version is **18.1.2.1.0_180511.0801**.

To update the tooling if the release label is higher than 17430

1. Check whether any cloud tooling updates are available.

```
# /var/opt/oracle/exapatch/exadbcpatchsm -list_tools
                                    :
          'current_version' => '18.1.2.1.180511',
          'last_async_precheck_patch_id' => ' ',
          'current_patch' => '180511',
          'last_async_apply_patch_id' => ' ',
          'patches' => [
                                     :

                            'patchid' => '18.1.4.1.0_180716.0000',
                            'last_precheck_txnid' => '',
                            'description' => 'DBAAS Tools for Oracle Public Cloud'
                          },
                          {
                            'patchid' => '18.1.4.1.0_180718.0000',
                            'last_precheck_txnid' => '',
                            'description' => 'DBAAS Tools for Oracle Public Cloud'
                          }
```

```
                    ]
        };
```

2. Examine the command response and determine the patch ID of the available cloud tooling update.

   The patch ID is listed in the patches group as the `patchid` value.

   Cloud tooling updates are cumulative. So if multiple updates are available (as in the example in step 1), you can simply install the latest update. There is no need to install all of the updates in order.

3. If an available patch is newer than the currently installed tools, download and apply the patch containing the cloud tooling update.

   ```
   # /var/opt/oracle/exapatch/exadbcpatchsm -toolsinst_async <patchid>
   ```

   where `patchid` is the patch ID that you located in the previous step.

   For example, the following command applies the latest patch available from the results in step 1:

   ```
   # /var/opt/oracle/exapatch/exadbcpatchsm -toolsinst_async 18.1.4.1.0_180718.0000
   ```

4. Repeat the previous steps on each compute node in the Exadata DB system.

Note

The `exadbcpatchsm` utility runs as a background process which outputs a transaction ID and immediately returns control to the user. Command output is written to a log file. You can monitor the progress of operations by executing:

```
# /var/opt/oracle/exapatch/exadbcpatchsm -get_status
transactionid
```

To update the tooling if the release label is 17430 or lower

1. Download the RPM file using the Swift object storage API endpoint URL for your region.

   ```
   wget <swift_API_endpoint>/v1/exadata/patches/dbaas_patch/shome/dbaastools_exa.rpm
   ```

   The following example downloads the RPM file from the us-phoenix-1.

   ```
   wget https://swiftobjectstorage.us-phoenix-1.oraclecloud.com/v1/exadata/patches/dbaas_
   patch/shome/dbaastools_exa.rpm
   ```

   See API Reference and Endpoints for the Swift API endpoint for your region.

2. Apply the RPM file.

   ```
   # rpm -ev dbaastools_exa
   # rpm -ivh dbaastools_exa.rpm
   ```

3. Repeat the previous steps on each compute node in the Exadata DB system.

Patching an Exadata DB System

This topic explains how to use the `exadbcpatchmulti` utility to perform patching operations for Oracle Grid Infrastructure and Oracle Database on an Exadata DB system. The `exadbcpatchmulti` utility is located in `/var/opt/oracle/exapatch` on every compute node. The utility requires root administration privileges.

Note

You must update the cloud specific tooling on all the compute nodes in your Exadata DB system before performing the following procedures. For more information, see Updating an Exadata DB System.

Prerequisites

Patches are stored in Oracle Cloud Infrastructure Object Storage, so the Exadata DB system

requires access to that service. To enable this access, Oracle recommends using a service gateway with the VCN. For more information, see Network Setup for Exadata DB Systems. In that topic, pay particular attention to:

- Service Gateway for the VCN
- Node Access to Object Storage: Static Route
- Rule for Backup Subnet's Custom Security List

Managing Patches

To list available patches

You can produce a list of available patches using the `exadbcpatchmulti` command:

1. Connect to the compute node as the `opc` user.
   For detailed instructions, see Connecting to an Exadata DB System.
2. Start a root-user command shell:

   ```
   $ sudo -s
   #
   ```

3. Execute the `exadbcpatchmulti` command with the `-list_patches` action:

   ```
   # /var/opt/oracle/exapatch/exadbcpatchmulti -list_patches
   -sshkey=sshkey_file -oh=hostname:oracle_home
   ```

   where:

   - `-sshkey` specifies the location of the SSH private key of the `opc` user, which is used to connect to compute nodes in the cluster. This is an optional parameter.
     `-oh` specifies a compute node and Oracle home directory for which you want to list the available patches. In this context, an Oracle home directory may be an Oracle Database home directory or the Oracle Grid Infrastructure home directory.

   For example:

   ```
   # /var/opt/oracle/exapatch/exadbcpatchmulti -list_patches -oh=exaverify-
   73z1v1:/u02/app/oracle/product/12.1.0/dbhome_2 -sshkey=/root/y.priv
   INFO: non async case
   ```

```
INFO: cmd is:  /var/opt/oracle/exapatch/exadbcpatchsm  -list_patches  -
oh=/u02/app/oracle/product/12.1.0/dbhome_2
INFO: non async case
INFO: cmd is: /var/opt/oracle/exapatch/exadbcpatch -list_patches -patch_
homes=/u02/app/oracle/product/12.1.0/dbhome_2
Starting EXADBCPATCH
Logfile is /var/opt/oracle/log/exadbcpatch/exadbcpatch_2017-07-03_19:40:49.log
Config file is /var/opt/oracle/exapatch/exadbcpatch.cfg
     INFO: dbversion detected : 12102
     INFO: patching type : psu
     INFO: using default values for oci_user
     INFO: using default value for oci_passwd
     INFO: images available for patching
     12.1.0.2.170117, ee
     $VAR1 = {
          'last_async_precheck_txn_id' => ' ',
          'last_async_apply_txn_id' => ' ',
          'errmsg' => 'no applicable patches found',
          'err' => '-1',
          'current_version' => '12.1.0.2.170117',
          'last_async_precheck_patch_id' => '',
          'current_patch' => '24968615',
          'last_async_apply_patch_id' => '',
          'patches' => []
          };
<json begin>{"last_async_precheck_txn_id":" ","last_async_apply_txn_id":" ","err":"-
1","errmsg":"no applicable patches found","current_version":"12.1.0.2.170117","last_async_
precheck_patch_id":"","current_patch":"24968615","last_async_apply_patch_id":"","patches":
[]}<json end>
```

Note

The list of available patches is determined by interrogating the database to establish the patches that have already been applied. When a patch is applied, the corresponding database entry is made as part of the SQL patching operation, which is executed at the end of the patch workflow. Therefore, the list of available patches may include partially applied patches along with patches that are currently being applied.

4. Exit the root-user command shell.

```
# exit
$
```

To check prerequisites before applying a patch

You can perform the prerequisites-checking operation using the `exadbcpatchmulti` command as follows:

1. Connect to the compute node as the `opc` user.
2. Start a root-user command shell:

```
$ sudo -s
#
```

3. Execute the `exadbcpatchmulti` command with the `-precheck_async` action:

```
# /var/opt/oracle/exapatch/exadbcpatchmulti -precheck_async patchid
-sshkey=sshkey_file
-instance1=hostname:oracle_home1[,oracle_home2 ...]
[-instance2=hostname:oracle_home1[,oracle_home2 ...] ...]
```

where:

- `patchid` identifies the patch to be pre-checked.
- `-sshkey` specifies the location of the SSH private key of the `opc` user, which is used to connect to compute nodes in the cluster.
- `-instanceN` specifies a compute node and one or more Oracle home directories that are subject to the patching operation. In this context, an Oracle home directory may be an Oracle Database home directory or the Oracle Grid Infrastructure home directory.

For example:

```
# /var/opt/oracle/exapatch/exadbcpatchmulti -precheck_async 12345678
-sshkey=/home/opc/.ssh/id_rsa
-instance1=hostname1:/u01/app/12.1.0.2/grid,/u01/app/oracle/product/12.1.0.2/dbhome_1
```

4. Exit the root-user command shell:

```
# exit
$
```

To apply a patch

You can apply a patch by using the `exadbcpatchmulti` command.

The patching operation:

- Can be used to patch some or all of your compute nodes using one command.
- Coordinates multi-node patching in a rolling manner.
- Can execute patch-related SQL after patching all the compute nodes in the cluster.

You can perform a patching operation using the `exadbcpatchmulti` command as follows:

1. Connect to the compute node as the `opc` user.
2. Start a root-user command shell:

```
$ sudo -s
#
```

3. Execute the `exadbcpatchmulti` command with the `-apply_async` action:

```
# /var/opt/oracle/exapatch/exadbcpatchmulti -apply_async patchid
-sshkey=sshkey_file
-instance1=hostname:oracle_home1 [, oracle_home2 ...]
[-instance2=hostname:oracle_home1 [,oracle_home2 ...] ...]
[-run_datasql=1]
```

where:

- `patchid` identifies the patch to be applied.
- `-sshkey` specifies the location of the SSH private key of the `opc` user, which is used to connect to compute nodes in the cluster.
- `-instance`*N* specifies a compute node and one or more Oracle home directories that are subject to the patching operation. In this context, an Oracle home directory may be an Oracle Database home directory or the Oracle Grid Infrastructure home directory.
- `-run_datasql=1` instructs the `exadbcpatchmulti` command to execute patch-related SQL commands.

Note

- Patch-related SQL should only be executed after all of the compute nodes are patched. Therefore, take care not to specify this argument if you are patching a subset of nodes and further nodes remain to be patched.
- This argument can only be specified in conjunction with a patching operation on a set of compute nodes. Therefore, if you have patched all of your nodes and you did not specify this argument, you will need to manually execute the SQL commands associated with the patch. Refer to the patch documentation for further details.

For example:

```
# /var/opt/oracle/exapatch/exadbcpatchmulti -apply_async 23456789
-sshkey=/home/opc/.ssh/id_rsa
-instance1=hostname1:/u01/app/oracle/product/12.1.0.2/dbhome_1
-instance2=hostname2:/u01/app/oracle/product/12.1.0.2/dbhome_1
-run_datasql=1
```

4. Exit the root-user command shell:

```
# exit
$
```

To list applied patches

You can produce a list of applied patches to determine which patches have been applied.

You can use the `opatch` utility to determine the patches that have been applied to an Oracle Database or Grid Infrastructure installation.

To produce a list of applied patches for an Oracle Database installation:

1. Connect to a compute node as the `oracle` user.
2. Set the ORACLE_HOME variable to the location of the Oracle Database installation you wish to examine. For example:

```
$ export ORACLE_HOME=/u01/app/oracle/product/12.1.0.2/dbhome_1
```

3. Execute the `opatch` command with the `lspatches` option:

```
$ $ORACLE_HOME/OPatch/opatch lspatches
```

To produce a list of applied patches for Oracle Grid Infrastructure:

1. Connect to a compute node as the `opc` user.
2. Become the `grid` user:

```
$ sudo -s
# su - grid
```

3. Execute the `opatch` command with the `lspatches` option:

```
$ $ORACLE_HOME/OPatch/opatch lspatches
```

To roll back a patch

You can roll back a patch or failed patch attempt on a by using the `exadbcpatchmulti` command.

The patch rollback operation:

- Can be used to roll back a patch on some or all of your compute nodes using one command.
- Coordinates multi-node operations in a rolling manner.

- Can execute rollback-related SQL after rolling back the patch on all the compute nodes in the cluster.

You can perform a patch rollback operation using the `exadbcpatchmulti` command as follows:

1. Connect to the compute node as the `opc` user.
2. Start a root-user command shell:

   ```
   $ sudo -s
   #
   ```

3. Execute the `exadbcpatchmulti` command with the `-rollback_async` action:

   ```
   # /var/opt/oracle/exapatch/exadbcpatchmulti -rollback_async patchid
   -sshkey=sshkey_file
   -instance1=hostname:oracle_home1[,oracle_home2 ...]
   [-instance2=hostname:oracle_home1[,oracle_home2 ...] ...]
   [-run_datasql=1]
   ```

   where:

   - `patchid` identifies the patch to be rolled back.
   - `-sshkey` specifies the location of the SSH private key of the `opc` user, which is used to connect to compute nodes in the cluster.
   - `-instanceN` specifies a compute node and one or more Oracle home directories that are subject to the rollback operation. In this context, an Oracle home directory may be an Oracle Database home directory or the Oracle Grid Infrastructure home directory.
   - `-run_datasql=1` instructs the `exadbcpatchmulti` command to execute rollback-related SQL commands.

Note

- Rollback-related SQL should only be executed after all of the compute nodes are rolled back. Therefore, take care not to specify this argument if you are rolling back a subset of nodes and further nodes remain to be rolled back.
- This argument can only be specified in conjunction with a rollback operation on a set of compute nodes. Therefore, if you have rolled back all of your nodes and you did not specify this argument, you will need to manually execute the SQL commands associated with the rollback operation. Refer to the patch documentation for further details.

For example:

```
# /var/opt/oracle/exapatch/exadbcpatchmulti -rollback_async 34567890
-sshkey=/home/opc/.ssh/id_rsa
-instance1=hostname1:/u01/app/12.1.0.2/grid
-instance2=hostname2:/u01/app/12.1.0.2/grid
-run_datasql=1
```

4. Exit the root-user command shell:

```
# exit
$
```

Monitoring a Database on an Exadata DB System

This topic explains how to access Enterprise Manager Database Express and Enterprise Manager Database Control, which are web-based tools for managing Oracle Database.

Accessing Enterprise Manager Database Express 12c

Enterprise Manager Database Express 12c (EM Express) is available on Exadata DB system database deployments created using Oracle Database 12c Release 1 (12.1) or later.

How you access EM Express depends on whether you want to manage a CDB or PDB.

- **To manage the CDB.** When a database deployment is created, Database automatically sets port 5500 on the deployment's compute nodes for EM Express access to the CDB.
- **To manage a PDB.** For an Oracle Database 12.2 or later deployment, a single port (known as the global port) is automatically set on the deployment's compute nodes. The global port lets you use EM Express to connect to all of the PDBs in the CDB using the HTTPS port for the CDB.
  For an Oracle Database 12.1 deployment, you must manually set a port on the deployment's compute nodes for each PDB you want to manage using EM Express.

For both CDBs and PDBs, you must add the port to a security list as described in Updating the Security List.

To confirm the port that is in use for a specific database, connect to the database as a database administrator and execute the query shown in the following example:

```
SQL> select dbms_xdb_config.getHttpsPort() from dual;

DBMS_XDB_CONFIG.GETHTTPSPORT()
------------------------------
                          5502
```

Setting the Port for EM Express to Manage a PDB (Oracle Database 12.1 Only)

In Oracle Database 12c Release 1, a unique HTTPS port must be configured for the root container (CDB) and each PDB that you manage using EM Express.

To configure a HTTPS port so that you can manage a PDB with EM Express:

1. Invoke SQL*Plus and log in to the PDB as the SYS user with SYSDBA privileges.
2. Execute the `DBMS_XDB_CONFIG.SETHTTPSPORT` procedure.

```
SQL> exec dbms_xdb_config.sethttpsport(port-number)
```

ACCESSING EM EXPRESS

Before you access EM Express, add the port to the security list. See Updating the Security List.

After you update the security list, you can access EM Express by directing your browser to the URL `https://<node-ip-address>:<port>/em`, where `node-ip-address` is the public IP address of the compute node hosting EM Express, and `port` is the EM Express port used by the database.

Accessing Enterprise Manager 11g Database Control

Enterprise Manager 11g Database Control (Database Control) is available on Exadata DB system database deployments created using Oracle Database 11g Release 2. Database Control is allocated a unique port number for each database deployment. By default, access to Database Control is provided using port 1158 for the first deployment. Subsequent deployments are allocated ports in a range starting with 5500, 5501, 5502, and so on.

You can confirm the Database Control port for a database by searching for `REPOSITORY_URL` in the `$ORACLE_HOME/host_sid/sysman/config/emd.properties` file.

Before you access Database Control, add the port for the database to the security list associated with the Exadata DB system's client subnet. For more information, see Updating the Security List.

After you update the security list, you can access Database Control by directing your browser to the URL `https://<node-ip-address>:<port>/em`, where `node-ip-address` is the public IP address of the compute node hosting Database Control, and `port` is the Database Control port used by the database.

Updating the Security List

Before you can access EM Express or Database Control, you must add the port for the database to the security list associated with the Exadata DB system's data (client) subnet. To update an existing security list, complete the following steps using the Console:

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Locate the DB system in the list.
4. Note the DB system's **Client Subnet** name and click its **Virtual Cloud Network**.
5. Locate the subnet in the list, and then click its security list under **Security Lists**.
6. Click **Edit All Rules** and add an ingress rule with source type=CIDR, source CIDR=*<source CIDR>*, protocol=TCP, and port=*<port number or port range>*.
   The source CIDR should be the CIDR block that includes the ports you open for the client connection.

For detailed information about creating or updating a security list, see Security Lists.

Managing Exadata Databases

When you launch an Exadata DB system, an initial database is created in that system. You can create additional databases in that DB system at any time by using the Console or the Oracle Cloud Infrastructure API.

When you add a database to an Exadata DB system, the database versions you can select from depend on the current patch level of that DB system. You might have to patch your DB system to add later database versions. For information about patching the DB system, see Patching an Exadata DB System.

Each new database is created in a separate database home.

Warning

Avoid entering confidential information when assigning descriptions, tags, or friendly names to your cloud resources through the Oracle Cloud Infrastructure Console, API, or CLI.

You can also add and remove databases, and perform other management tasks on a database by using command line utilities. For information and instructions on how to use these utilities, see Managing Exadata Databases Manually.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let database admins manage database systems lets the specified group do everything with databases and related Database resources.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for databases, see Details for the Database Service.

Note

See Known Issues for information about using the Oracle Cloud Infrastructure Console, API, or CLI to manage Exadata DB systems if your system was provisioned before June 15, 2018.

Using the Console

To create a new database in an existing Exadata DB system

Note

If IORM is enabled on the DB system, the default

directive will apply to the new database and system performance might be impacted. Oracle recommends that you review the IORM settings and make applicable adjustments to the configuration after the new database is provisioned.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB systems, find the Exadata DB system in which you want to create the database, and then click its name to display details about it.
4. Click **Create Database**.
5. In the **Create Database** dialog, enter the following:
   - **Database Name:** The name for the database. The database name must begin with an alphabetic character and can contain a maximum of eight alphanumeric characters. Special characters are not permitted.
   - **Database Version:** The version of the database. You can mix database versions on the Exadata DB system.
   - **PDB Name** (Optional) For version 12.1.0.2 and later, you can specify the name of the pluggable database. The PDB name must begin with an alphabetic character, and can contain a maximum of 8 alphanumeric characters. The only special character permitted is the underscore (_).
   - **Admin Password:** A strong password for SYS, SYSTEM, TDE wallet, and PDB Admin. The password must be nine to thirty characters and contain at least two uppercase, two lowercase, two numeric, and two special characters. The special characters must be _, #, or -. In addition, this password must not contain the name of the tenancy or any reserved words, such as "Oracle" or "Table," regardless of casing.
   - **Confirm Admin Password:** Re-enter the database admin password.

- **Database Workload:** Select the workload type that best suits your application.
  - **Online Transactional Processing (OLTP)** configures the database for a transactional workload, with a bias towards high volumes of random data access.
  - **Decision Support System (DSS)** configures the database for a decision support or data warehouse workload, with a bias towards large data scanning operations.

6. Optionally, you can specify the character set and/or national character set for this database. Click **Show Advanced Options** to set these parameters. The defaults are AL32UTF8 and AL16UTF16, respectively.
7. Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
8. Click **Create Database**.

When the database creation is complete, the status changes from Provisioning to Available.

To terminate a database

Oracle recommends that you create a final backup before you terminate any production (non-test) database. See Backing Up an Exadata Database to learn how to back up an Exadata database.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB Systems, find the DB System that contains the database you want to terminate, and then click its name to display details about it.
4. In the list of databases, find the database, click the Actions icon (three dots) and then

click **Terminate**.

5. Type the name of the database to confirm the termination.
6. Click **Terminate Database**.
   The database's status indicates Terminating.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage databases.

Database homes:

- ListDbHomes
- GetDbHome
- CreateDbHome
- DeleteDbHome

Databases:

- ListDatabases
- GetDatabase

For the complete list of APIs for the Database service, see Database Service API.

Managing Exadata Databases Manually

Exadata DB systems include these command line tools for performing various tasks to manage individual databases:

- `dbaasapi` - For adding and removing databases from the Exadata DB system. See Using dbaasapi.

- `dbaascli` - For a variety of life-cycle and administration operations such as:
    - Starting and stoping a database
    - Starting and stoping the Oracle Net listener
    - Viewing information about Oracle Homes
    - Moving a database to another Oracle Home
    - Deleting an unused Oracle Home
    - Performing database configuration changes
    - Managing Oracle Database software images
    - Managing pluggable databases (PDBs)
    - Performing database recovery
    - Rotating the master encryption key

  For details about how to use this CLI, see The dbaascli Utility.

Using dbaasapi

You can use the `dbaasapi` command line utility to create and delete databases on an Exadata DB system. The utility operates like a REST API. It reads a JSON request body and produces a JSON response body in an output file.

The utility is located in the `/var/opt/oracle/dbaasapi/` directory on the compute nodes and must be run as the root user.

To learn how to add or remove Exadata databases by using the Oracle Cloud Infrastructure Console or API instead, see Managing Exadata Databases.

Note

You must update the cloud-specific tooling on all the compute nodes in your Exadata DB system before performing the following procedures. For more information, see Updating an Exadata DB System.

Only one `dbaasapi` operation can execute at a given time. Oracle recommends that you check the status of an operation to ensure it completed before you run another operation.

Prerequisites

If you plan to create a database and store its backups in the Oracle Cloud Infrastructure Object Storage, refer to the prerequisites in Backing Up an Exadata Database, and ensure that the system meets the networking requirements for backing up to Object Storage. Review the Create Database Parameters and gather the information you'll need to supply in the input file you create for the `dbaasapi` operation.

Warning

Oracle recommends that you avoid specifying parameter values that include confidential information when you use the `dbaasapi` commands.

Creating a Database

The following procedure creates directory called `dbinput`, a sample input file called `myinput.json`, and a sample output file called `createdb.out`.

1. SSH to a compute node in the Exadata DB system.

```
ssh -i <private_key_path> opc@<node_ip_address>
```

2. Log in as opc and then sudo to the root user.

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. Make a directory for the input file and change to the directory.

```
[root@dbsys ~]# mkdir -p /home/oracle/dbinput
# cd /home/oracle/dbinput
```

4. Create the input file in the directory. The following sample file will create a database configured to store backups in an existing bucket in Object Storage. For parameter descriptions, see Create Database Parameters.

```
{
  "object": "db",
  "action": "start",
  "operation": "createdb",
  "params": {
    "nodelist":              "",
    "dbname":                "exadb",
    "edition":               "EE_EP",
    "version":               "12.1.0.2",
    "adminPassword":         "<password>",
    "sid":                   "exadb",
    "pdbName":               "PDB1",
    "charset":               "AL32UTF8",
    "ncharset":              "AL16UTF16",
    "backupDestination":     "OSS",
    "cloudStorageContainer": "https://swiftobjectstorage.<region_
name>.oraclecloud.com/v1/mycompany/DBBackups",
    "cloudStorageUser":      "<name@example.com>",
    "cloudStoragePwd":       "<auth_token>"
  },
  "outputfile": "/home/oracle/createdb.out",
  "FLAGS": ""
}
```

5. Run the utility and specify the input file.

```
[root@dbsys ~]# /var/opt/oracle/dbaasapi/dbaasapi -i myinput.json
```

6. Check the output file and note the ID.

```
[root@dbsys ~]# cat /home/oracle/createdb.out
{
   "msg" : "",
   "object" : "db",
   "status" : "Starting",
   "errmsg" : "",
   "outputfile" : "/home/oracle/createdb.out",
   "action" : "start",
   "id" : "170",
   "operation" : "createdb",
   "logfile" : "/var/opt/oracle/log/gsa1/dbaasapi/db/createdb/1.log"
}
```

7. Create a JSON file to check the database creation status. Note the action of `"status"`. Replace the ID and the dbname with the values from the previous steps.

```
{
  "object": "db",
  "action": "status",
  "operation": "createdb",
  "id": 170,
  "params": {
    "dbname": "exadb"
  },
  "outputfile": "/home/oracle/createdb.out",
  "FLAGS": ""
}
```

8. Run the utility with the status file as input and then check the utility output.
   Rerun the status action regularly until the response indicates that the operation succeeded or failed.

```
[root@dbsys ~]# /var/opt/oracle/dbaasapi/dbaasapi -i db_status.json

[root@dbsys ~]# cat /home/oracle/createdb.out

{
```

```

CREATE DATABASE PARAMETERS

Use the following parameters to create a database.

Parameter	Description
object	The value `"db"`.
action	The value `"start"`.
operation	The value `"createdb"`.
nodelist	The value `""` (an empty string). The database will be created across all nodes in the cluster.

Parameter	Description
dbname	The database name, in quotes.
edition	The value "EE_EP". (Only Enterprise Edition - Extreme Performance is supported .)
version	The database version as 18.0.0.0, 12.2.0.1, 12.1.0.2, or 11.2.0.4, in quotes.
adminPassword	The administrator (SYS and SYSTEM) password to use for the new database, in quotes. The password must be nine to thirty characters and contain at least two uppercase, two lowercase, two numeric, and two special characters. The special characters must be _, #, or -.
sid	The SID of the database, in quotes.
pdbName	The name of the pluggable database, in quotes.

Parameter	Description
charset	The database character set, in quotes. Allowed values AL32UTF8, AR8ADOS710, AR8ADOS720, AR8APTEC715, AR8ARABICMACS, AR8ASMO8X, AR8ISO8859P6, AR8MSWIN1256, AR8MUSSAD768, AR8NAFITHA711, AR8NAFITHA721, AR8SAKHR706, AR8SAKHR707, AZ8ISO8859P9E, BG8MSWIN, BG8PC437S, BLT8CP921, BLT8ISO8859P13, BLT8MSWIN1257, BLT8PC775, BN8BSCII, CDN8PC863, CEL8ISO8859P14, CL8ISO8859P5, CL8ISOIR111, CL8KOI8R, CL8KOI8U, CL8MACCYRILLICS, CL8MSWIN1251, EE8ISO8859P2, EE8MACCES, EE8MACCROATIANS, EE8MSWIN1250, EE8PC852, EL8DEC, EL8ISO8859P7, EL8MACGREEKS, EL8MSWIN1253, EL8PC437S, EL8PC851, EL8PC869, ET8MSWIN923, HU8ABMOD, HU8CWI2, IN8ISCII, IS8PC861, IW8ISO8859P8, IW8MACHEBREWS, IW8MSWIN1255, IW8PC1507, JA16EUC, JA16EUCTILDE, JA16SJIS, JA16SJISTILDE, JA16VMS, KO16KSCCS, KO16MSWIN949, LA8ISO6937, LA8PASSPORT, LT8MSWIN921, LT8PC772, LT8PC774, LV8PC1117, LV8PC8LR, LV8RST104090, N8PC865, NE8ISO8859P10, NEE8ISO8859P4, RU8BESTA, RU8PC855, RU8PC866, SE8ISO8859P3, TH8MACTHAIS, TH8TISASCII, TR8DEC, TR8MACTURKISHS, TR8MSWIN1254, TR8PC857, US7ASCII, US8PC437, UTF8, VN8MSWIN1258, VN8VN3, WE8DEC, WE8DG, WE8ISO8859P15, WE8ISO8859P9, WE8MACROMAN8S, WE8MSWIN1252, WE8NCR4970, WE8NEXTSTEP, WE8PC850, WE8PC858, WE8PC860, WE8ROMAN8, ZHS16CGB231280, ZHS16GBK, ZHT16BIG5, ZHT16CCDC, ZHT16DBT, ZHT16HKSCS, ZHT16MSWIN950, ZHT32EUC, ZHT32SOPS, ZHT32TRIS

Parameter	Description
ncharset	The database national character set. The value `AL16UTF16` or `UTF8`, in quotes.
backupDestination	The database backup destination, in quotes. You can configure the following backup destinations. `NONE` No backup destination is configured. `DISK` Configure database backups to the local disk Fast Recovery Area. `OSS` Configure database backups to an existing bucket in the Oracle Cloud Infrastructure Object Storage service. You must specify all the `cloudStorage` parameters. `BOTH` Configure database backups to both local disk and an existing bucket in Object Storage. You must specify all the `cloudStorage` parameters. For example: `"backupDestination":"BOTH"`

Parameter	Description
cloudStorageContainer= *<swift_url>*	Required if you specify a backup destination of `OSS` or `BOTH`. The Object Storage URL, your Oracle Cloud Infrastructure tenant, and an existing bucket in the object store to use as the backup destination, in the following format: `https://swiftobjectstorage.<region_name>.oraclecloud.com/v1/<tenant>/<bucket>` See Regions and Availability Domains to look up the region name string. For example: `"cloudStorageContainer":"https://swiftobjectstorage.<region_name>.oraclecloud.com/v1/<company_name>/DBBackups"`
cloudStorageUser= *<user_name>*	Required if you specify a backup destination of `OSS` or `BOTH`. The user name for the Oracle Cloud Infrastructure user account, for example: `"cloudStorageUser":"name@company.com"` This is the user name you use to sign in to the Console. The user name must be a member of the Administrators group, as described in Prerequisites.

Parameter	Description
cloudStoragePwd= *<auth_token>*	Required if you specify a backup destination of `OSS` or `BOTH`. The auth token generated by using the Console or IAM API, in quotes, for example: `"cloudStoragePwd":"<auth_token>"` For more information, see Managing User Credentials. This is **not** the password for the Oracle Cloud Infrastructure user.
outputfile	The absolute path for the output of the request, for example, `"outputfile":"/home/oracle/createdb.out"`.
FLAGS	The value `""` (an empty string).

Deleting a Database

Oracle recommends that you create a final backup before you delete any production (non-test) database. See Backing Up an Exadata Database to learn how to back up an Exadata database.

1. SSH to a compute node in the Exadata DB system.

```
ssh -i <private_key_path> opc@<node_ip_address>
```

2. Log in as opc and then sudo to the root user.

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. Make a directory for the input file and change to the directory.

```
[root@dbsys ~]# mkdir -p /home/oracle/dbinput

# cd /home/oracle/dbinput
```

4. Create the input file in the directory and specify the database name to delete and an output file. For more information, see Delete Database Parameters .

```
{
  "object":  "db",
  "action":  "start",
  "operation": "deletedb",
  "params": {
    "dbname": "exadb"
  },
   "outputfile":   "/home/oracle/delete_exadb.out",
   "FLAGS": ""
}
```

5. Run the utility and specify the input file.

```
[root@dbsys ~]# /var/opt/oracle/dbaasapi/dbaasapi -i myinput.json
```

6. Check the output file and note the ID.

```
[root@ed1db01 ~]# cat /home/oracle/delete_exadb.out

{
   "msg" : "",
   "object" : "db",
   "status" : "Starting",
   "errmsg" : "",
   "outputfile" : "/home/oracle/deletedb.out",
   "action" : "start",
   "id" : "17",
   "operation" : "deletedb",
   "logfile" : "/var/opt/oracle/log/exadb/dbaasapi/db/deletedb/17.log"
}
```

7. Create a JSON file to check the database deletion status. Note the action of "status" in the sample file below. Replace the ID and the dbname with the values from the previous steps.

```
{
  "object": "db",
  "action": "status",
  "operation": "deletedb",
```

```
  "id": 17,
  "params": {
    "dbname": "exadb"
  },
  "outputfile": "/home/oracle/deletedb.out",
  "FLAGS": ""
}
```

8. Run the utility with the status file as input and then check the utility output.
   Rerun the status action regularly until the response indicates that the operation succeeded.

```
[root@dbsys ~]#  /var/opt/oracle/dbaasapi/dbaasapi -i db_status.json

[root@dbsys ~]# cat /home/oracle/deletedb.out

{
   "msg" : "Using cmd : su - root -c \"/var/opt/oracle/ocde/assistants/dg/dgcc -dbname exadb -
action delete\" \\n\\n##Done executing dg\\nWARN: Could not register elogger_parameters:

nid=\"no\" -dbname=\"exadb\" -action=delete \\n",
   "object" : "db",
   "status" : "InProgress",
   "errmsg" : "",
   "outputfile" : "/home/oracle/deletedb.out",
   "action" : "start",
   "id" : "17",
   "operation" : "deletedb",
   "logfile" : "/var/opt/oracle/log/exadb/dbaasapi/db/deletedb/17.log"
}
```

DELETE DATABASE PARAMETERS

Use the following parameters to delete a database.

Parameter	Description
object	The value `"db"`.
action	The value `"start"`.
operation	The value `"deletedb"`.
dbname	The database name, in quotes.
outputfile	The absolute path for the output of the request, for example, `"/home/oracle/deletedb.out"`.
FLAGS	The value `""` (an empty string).

Backing Up an Exadata Database

You can back up databases on an Exadata DB system to an existing bucket in the Oracle Cloud Infrastructure Object Storage service and to the local disk Fast Recovery Area.

This topic explains how to:

- Create a backup configuration file that indicates the backup destination, when the backup should run, and how long backups are retained. If the backup destination is Object Storage, the file also contains the credentials to access the service.
- Associate the backup configuration file with a database. The database will be backed up as scheduled, or you can create an on-demand backup.

Note

You must update the cloud-specific tooling on all the compute nodes in your Exadata DB system before performing the following procedures. For more information, see Updating an Exadata DB System.

Prerequisites

- The Exadata DB system requires access to the Oracle Cloud Infrastructure Object Storage service. Oracle recommends using a service gateway with the VCN to enable this access. For more information, see Network Setup for Exadata DB Systems. In that topic, pay particular attention to:
  - Service Gateway for the VCN
  - Node Access to Object Storage: Static Route
  - Rule for Backup Subnet's Custom Security List
- An existing Object Storage bucket to use as the backup destination. You can use the Console or the Object Storage API to create the bucket. For more information, see Managing Buckets.
- An auth token generated by Oracle Cloud Infrastructure. You can use the Console or the IAM API to generate the password. For more information, see Working with Auth Tokens.
- The user name specified in the backup configuration file must have tenancy-level access to Object Storage. An easy way to do this is to add the user name to the Administrators group. However, that allows access to *all* of the cloud services. Instead, an administrator should create a policy like the following that limits access to only the required resources in Object Storage for backing up and restoring the database:

  ```
  Allow group <group_name> to manage objects in compartment <compartment_name> where
  target.bucket.name = '<bucket_name>'

  Allow group <group_name> to read buckets in compartment <compartment_name>
  ```

  For more information about adding a user to a group, see Managing Groups. For more information about policies, see Getting Started with Policies.

Default Backup Configuration

The backup configuration follows a set of Oracle best-practice guidelines:

- Full (level 0) backup of the database followed by rolling incremental (level 1) backups on a seven-day cycle (a 30-day cycle for the Object Storage destination).
- Full backup of selected system files.
- Automatic backups daily at a specific time set during the database deployment creation process.

Retention period:

- Both Object Storage and local storage: 30 days, with the 7 most recent days' backups available on local storage.
- Object Storage only: 30 days.
- Local storage only: Seven days.

Encryption:

- Both Object Storage and local storage: All backups to cloud storage are encrypted.
- Object Storage only: All backups to cloud storage are encrypted.

Managing Backups

To create a backup configuration file

Important

The following procedure must be performed on the first compute node in the Exadata DB system. To determine the first compute node, connect to any compute node as the `grid` user and execute the following command:

```
$ $ORACLE_HOME/bin/olsnodes -n
```

The first node has the number 1 listed beside the node name.

1. SSH to the first compute node in the Exadata DB system.

```
ssh -i <private_key_path> opc@<node_1_ip_address>
```

2. Log in as opc and then sudo to the root user.

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. Create a new backup configuration file in `/var/opt/oracle/ocde/assistants/bkup/` as shown in the sample configuration file below. This example uses the file name `bkup.cfg`, but you can provide your own file name. The following file schedules a backup to both local storage and an existing bucket in Object Storage.
   The parameters are described below this procedure.

```
[root@dbsys ~]# cd /var/opt/oracle/ocde/assistants/bkup/

vi bkup.cfg
bkup_disk=yes
bkup_oss=yes
bkup_oss_url=https://swiftobjectstorage.<region_name>.oraclecloud.com/v1/companyabc/DBBackups
bkup_oss_user=name@example.com
bkup_oss_passwd=<auth_token>
bkup_oss_recovery_window=7
bkup_daily_time=06:45
```

4. Change the permissions of the file.

```
[root@dbsys bkup]# chmod 600 bkup.cfg
```

5. Use the following command to install the backup configuration, configure the credentials, schedule the backup, and associate the configuration with a database name.

```
[root@dbsys bkup]# ./bkup -cfg bkup.cfg -dbname=<database_name>
```

   The backup is scheduled via cron and can be viewed at `/etc/crontab`.

When the scheduled backup runs, you can check its progress with the following command.

```
[root@dbsys bkup]# /var/opt/oracle/bkup_api/bkup_api bkup_status
```

The backup configuration file parameters are described in the following table:

Parameter	Description
bkup_disk=[yes|no]	Whether to back up locally to disk (Fast Recovery Area).
bkup_oss=[yes|no]	Whether to back up to Object Storage. If yes, you must also provide the parameters bkup_oss_url, bkup_oss_user, bkup_oss_passwd, and bkup_oss_recovery_window.

Parameter	Description
bkup_oss_url=*<swift_url>*	Required if bkup_oss=yes. The Object Storage URL including the tenant and bucket you want to use. The URL is: `https://swiftobjectstorage.<region_name>.oraclecloud.com/v1/<tenant>/<bucket>` where *<tenant>* is the *lowercase* tenant name (even if it contains uppercase characters) that you specify when signing in to the Console and *<bucket>* is the name of the existing bucket you want to use for backups. See Regions and Availability Domains to look up the region name string.

Parameter	Description
bkup_oss_user=*<oci_user_name>*	Required if bkup_oss=yes. The user name for the Oracle Cloud Infrastructure user account, which takes the form `name@example.com`. The user must be a member of the Administrators group, as described in Prerequisites. This is the user name you use to sign in to the Console.
bkup_oss_passwd=*<auth_token>*	Required if bkup_oss=yes. The auth token generated by using the Console or IAM API, as described in Prerequisites. This is **not** the password for the Oracle Cloud Infrastructure user.

Parameter	Description
bkup_oss_recovery_window=*n*	Required if bkup_oss=yes. The number of days for which backups and archived redo logs are maintained in the Object Storage bucket. Specify 1 to 30 days.
bkup_daily_time=*hh:mm*	The time at which the daily backup is scheduled, specified in hours and minutes (hh:mm), in 24-hour format.

To create an on-demand backup

You can use the `bkup_api` utility to create an on-demand backup of a database.

Warning

Oracle recommends that you avoid supplying values that include confidential information when you use the `bkup_api` command.

1. SSH to the first compute node in the Exadata DB system.

   ```
   ssh -i <private_key_path> opc@<node_1_IP_address>
   ```

   To determine the first compute node, connect to any compute node as the `grid` user and execute the following command:

   ```
   $ $ORACLE_HOME/bin/olsnodes -n
   ```

The first node has the number 1 listed beside the node name.

2. Log in as opc and then sudo to the root user.

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. You can let the backup follow the current retention policy, or you can create a long-term backup that persists until you delete it:
   - To create a backup that follows the current retention policy, enter the following command:

     ```
     # /var/opt/oracle/bkup_api/bkup_api bkup_start --dbname=<database_name>
     ```

   - To create a long-term backup, enter the following command:

     ```
     # /var/opt/oracle/bkup_api/bkup_api bkup_start --keep --dbname=<database_name>
     ```

4. Exit the root-user command shell and disconnect from the compute node:

```
# exit
$ exit
```

By default, the backup is given a timestamp-based tag. To specify a custom backup tag, add the `--tag` option to the `bkup_api` command; for example, to create a long-term backup with the tag "monthly", enter the following command:

```
# /var/opt/oracle/bkup_api/bkup_api bkup_start --keep --tag=monthly
```

After you enter a `bkup_api bkup_start` command, the `bkup_api` utility starts the backup process, which runs in the background. To check the progress of the backup process, enter the following command:

```
# /var/opt/oracle/bkup_api/bkup_api bkup_status --dbname=<database_name>
```

To remove the backup configuration

A backup configuration can contain the credentials to access the Object Storage bucket. For this reason, you might want to remove the file after successfully configuring the backup.

```
[root@dbsys bkup]# rm bkup.cfg
```

To delete a local backup

To delete a backup of a database deployment on the Exadata DB system, use the `bkup_api` utility.

1. Connect to the first compute node in your Exadata DB system as the `opc` user.
   To determine the first compute node, connect to any compute node as the `grid` user and execute the following command:

   ```
   $ $ORACLE_HOME/bin/olsnodes -n
   ```

   The first node has the number 1 listed beside the node name.
2. Start a root-user command shell:

   ```
   $ sudo -s#
   ```
3. List the available backups:

   ```
   # >/var/opt/oracle/bkup_api/bkup_api recover_list --dbname=<database_name>
   ```

   where `dbname` is the database name for the database that you want to act on.
   A list of available backups is displayed.
4. Delete the backup you want:

   ```
   # /var/opt/oracle/bkup_api/bkup_api bkup_delete --bkup=<backup_tag> --dbname=<database_name>
   ```

   where `backup_tag` is the tag of the backup you want to delete.
5. Exit the root-user command shell:

   ```
   # exit$
   ```

To delete a backup in Object Storage

Use the RMAN `delete backup` command to delete a backup from the Object Store.

WHAT NEXT?

If you used Object Storage as a backup destination, you can display the backup files in your bucket in the Console on the **Storage** page, by selecting **Object Storage**.

You can manually restore a database backup by using the RMAN utility. For information about using RMAN, see the *Oracle Database Backup and Recovery User's Guide* for Release 18.1, 12.2, 12.1, or 11.2.

Recovering an Exadata Database

Exadata DB systems provide a backup feature that backs up the Oracle database associated with a database deployment. This feature is built over Oracle Recovery Manager (RMAN).

You can manually restore a database backup by using the RMAN utility. For information about using RMAN, see the *Oracle Database Backup and Recovery User's Guide* for Release 18.1, 12.2, 12.1, or 11.2.

DB System Time Zone

Note

This topic applies only to Exadata DB systems.

The Time Zone field in the Console and in the API allows you to launch an Exadata DB system with a time zone other than UTC (the default). Although UTC is the recommended time zone to use, having a common time zone for your database clients and application hosts can simplify management and troubleshooting for the database administrator.

The time zone that you specify when you create the DB system applies to the host and to the Oracle Grid Infrastructure, and controls the time zone of the database log files. The time zone of the database itself is not affected, however, the database's time zone affects only the timestamp datatype. By default, it is set to UTC and although you can change it manually, Oracle recommends that you keep it as UTC to avoid data conversion and improve

performance when data is transferred among databases. This is especially important for distributed databases, replication, and exporting and importing.

Time Zone Options

Whether you use the Console or the API, the time zone options you can select from are represented in the named region format, for example, *America/Los_Angeles*. The Console allows you to select UTC, the time zone detected in your browser (if your browser supports time zone detection), or an alternate time zone.

To specify an alternate time zone (the **Select Another Time Zone** option), you first select a value in the Time Zone Prefix field to narrow the list of time zones from which to select in the Time Zone Suffix field. In the *America/Los_Angeles* example, *America* is the time zone prefix and *Los_Angeles* is the time zone suffix. The items you see in the Time Zone Prefix and Time Zone Suffix fields roughly correlate with the time zones supported in both the Java.util.TimeZone class and on the Linux operating system. If you do not see the time zone you are looking for, try selecting "Miscellaneous" as the time zone prefix.

Tip

If you are using the API and would like to see a list of supported time zones, you can examine the time zone options in the Console. These options appear in the **Launch DB System** dialog when you show advanced options after you select an Exadata DB system shape.

Changing Time Zones After Provisioning

Follow these steps if you need to change the time zone of the Exadata DB system, Oracle Grid Infrastructure, or database, after you launch the DB system:

To change the time zone of the DB system host

1. Log on to the host system as `root`.
2. Stop the CRS stack on all of the Exadata compute nodes.

```
#Grid_Home/bin/crsctl stop crs
```

3. Run the following commands to check the current time zone and to change it to the time zone you choose:

```
$ cat /etc/sysconfig/clock
ZONE="America/New_York"
$ cp -p /etc/sysconfig/clock /etc/sysconfig/clock.20160629

$ vi /etc/sysconfig/clock
ZONE="Europe/Berlin"

$ date
Wed Jun 29 10:35:17 EDT 2016
$ ln -sf /usr/share/zoneinfo/Europe/Berlin /etc/localtime
$ date
Wed Jun 29 16:35:27 CEST 2016
```

   In this example, the time zone was changed from *America/New_York* to *Europe/Berlin*.

Tip

To see a list of valid time zones on the host, you can run the `ls -l /usr/share/zoneinfo` command.

4. (Optional) Verify that `/opt/oracle.cellos/cell.conf` indicates the correct time zone. Using our example, the time zone entry in this file would be `<Timezone>Europe/Berlin</Timezone>`.
5. Restart the CRS stack on all of the Exadata compute nodes.

```
#Grid_Home/bin/crsctl start crs
```

To change the time zone of the Oracle Grid Infrastructure

The time zone of the Oracle Grid Infrastructure determines the time zone of the database log files. You can change this time zone by updating the `TZ` property in the `GRID_HOME/crs/install/s_crsconfig_<node_name>_env.txt` configuration file.

1. Ensure that you are logged onto the host as `root` and that the CRS stack is stopped on all of the Exadata compute nodes. See To change the time zone of the DB system host.
2. Inspect the current time zone value in the `GRID_HOME/crs/install/s_crsconfig_<node_name>_env.txt` file.

```
$ cat /u01/app/12.1.0.2/grid/crs/install/s_crsconfig_node1_env.txt
################################################################################
#This file can be used to set values for the NLS_LANG and TZ environment
#variables and to set resource limits for Oracle Clusterware and
#Database processes.
#1. The NLS_LANG environment variable determines the language and
#   characterset used for messages. For example, a new value can be
#   configured by setting NLS_LANG=JAPANESE_JAPAN.UTF8
#2. The Time zone setting can be changed by setting the TZ entry to
#   the appropriate time zone name. For example, TZ=America/New_York
#3. Resource limits for stack size, open files and number of processes
#   can be specified by modifying the appropriate entries.
#
#Do not modify this file except as documented above or under the
#direction of Oracle Support Services.
################################################################################
TZ=UTC
NLS_LANG=AMERICAN_AMERICA.WE8ISO8859P1
CRS_LIMIT_STACK=2048
CRS_LIMIT_OPENFILE=65536
CRS_LIMIT_NPROC=16384
TNS_ADMIN=
```

   In this example, the time zone is set to UTC.
3. Modify the time zone value, as applicable. Perform this task for all nodes in the cluster.

4. Restart the CRS stack on all of the Exadata compute nodes.

```
#Grid_Home/bin/crsctl start crs
```

For more information about changing the time zone of the Grid Infrastructure, see How To Change Timezone for Grid Infrastructure (Doc ID 1209444.1).

To change the time zone of a database

Use the `ALTER DATABASE SET TIME_ZONE` command to change the time zone of a database. This command takes either a named region such as America/Los_Angeles or an absolute offset from UTC.

This example sets the time zone to UTC:

```
ALTER DATABASE SET TIME_ZONE = '+00:00';
```

You must restart the database for the change to take effect. For more information, see Setting the Database Time Zone.

Bare Metal and Virtual Machine DB Systems

Oracle Cloud Infrastructure offers 1-node DB systems on either bare metal or virtual machines, and 2-node RAC DB systems on virtual machines.

You can manage these systems by using the Console, the API, the Oracle Cloud Infrastructure CLI, the Database CLI (DBCLI), Enterprise Manager, Enterprise Manager Express, or SQL Developer.

Note

This documentation is intended for Oracle database administrators and assumes familiarity with Oracle databases and tools. If you need additional information, see the product documentation available at http://docs.oracle.com/en/database/.

Supported Database Editions and Versions

All 1- node RAC DB systems support the following Oracle Database editions:

- Standard Edition
- Enterprise Edition
- Enterprise Edition - High Performance
- Enterprise Edition - Extreme Performance

2-node RAC DB systems require Oracle Enterprise Edition - Extreme Performance.

The supported database versions are:

- Oracle Database 18c
- Oracle Database 12c Release 2 (12.2)
- Oracle Database 12c Release 1 (12.1)
- Oracle Database 11g Release 2 (11.2)

Tip

Your DB system's operating system will periodically need to be updated, just as your Oracle Database software will need to be updated. Before attempting an OS update, be sure to read the information in Updating a DB System and back up your DB system's databases.

Availability of Older Database Versions for Virtual Machine DB Systems

For virtual machine DB systems, Oracle Cloud Infrastructure also supports the creation of DB systems using older database versions. For each shape, the latest version and recent prior versions of the release are available at provisioning.

Warning

If you need to launch your dbsystem with an older database version, see Critical Patch Updates for information on known security issues with your chosen database version. You will also need to analyze and patch known security issues for the operating system included with the older database version. See Securing Database for information on security best practices for databases in Oracle Cloud Infrastructure.

Bare Metal DB Systems

Bare metal DB systems consist of a single bare metal server running Oracle Linux 6.8, with locally attached NVMe storage. If the node fails, you can simply launch another system and restore the databases from current backups.

When you launch a bare metal DB system, you select a single Oracle Database Edition that applies to all the databases on that DB system. The selected edition cannot be changed. Each DB system can have multiple database homes, which can be different versions. Each database home can have only one database, which is the same version as the database home.

Shapes for Bare Metal DB Systems

When you launch a DB system, you choose a *shape*, which determines the resources allocated to the DB system. The available shapes for a bare metal DB system are:

- **BM.DenseIO2.52:** Provides a 1-node DB system (one bare metal server), with up to 52 CPU cores, 768 GB memory, and eight 6.4 TB locally attached NVMe drives (51.2 TB total) to the DB system.
- **BM.DenseIO1.36:** *Limited availability.* Provides a 1-node DB system (one bare metal server), with up to 36 CPU cores, 512 GB memory, and nine 3.2 TB locally attached NVMe drives (28.8 TB total) to the DB system.
  Note: BM.DenseO1.36 is available only to monthly universal credit customers existing on or before November 9th, 2018. This shape is available only in the us-phoenix-1, us-ashburn-1, and eu-frankfurt-1 regions.

Storage Considerations

The shape you choose for a bare metal DB system determines its total raw storage, but other options, like 2- or 3-way mirroring and the space allocated for data files, affect the amount of usable storage on the system. The following table shows how various configurations affect the usable storage for bare metal DB systems.

Shape	Raw Storage	Usable Storage with Normal Redundancy (2-way Mirroring)	Usable Storage with High Redundancy (3-way Mirroring)
BM.DenseIO2.52	51.2 TB NVMe	DATA 16 TB RECO 4 TB	DATA 9 TB RECO 2.3 TB
BM.DenseIO1.36 see note	28.8 TB NVMe	DATA 9.4 TB RECO 1.7 TB	DATA 5.4 TB RECO 1 TB

Note: BM.DenseIO1.36 availability is limited to monthly universal credit customers existing on or before November 9th, 2018, in the us-phoenix-1, us-ashburn-1, and eu-frankfurt-1 regions.

Virtual Machine DB Systems

There are two types of DB systems on virtual machines:

- A 1-node virtual machine DB system consists of one virtual machine.
- A 2-node virtual machine DB system consists of two virtual machines.

When you launch a virtual machine DB system, you select the Oracle Database Edition that applies to the database on that DB system. The selected edition cannot be changed. Unlike a bare metal DB system, a virtual machine DB system can have only a single database home, which in turn can have only a single database. The database can be a container database (CDB) with multiple pluggable databases (PDBs), if the edition is High Performance or Extreme Performance. The database will be the same version as the database home.

Virtual machine DB systems also differ from bare metal DB systems in the following ways:

- A virtual machine DB system database uses Oracle Cloud Infrastructure block storage instead of local storage. You specify a storage size when you launch the DB system, and you can scale up the storage as needed at any time.
- The number of CPU cores on an existing virtual machine DB system cannot be changed.

Fault Domain Considerations for 2-node Virtual Machine DB Systems

When you provision a 2-node RAC DB systems, the system assigns each node to a different fault domain by default. Using the **Advanced Options** link in the provisioning dialog, you can select the fault domain(s) to be used for your 2-node RAC DB systems and the system will assign the nodes to your selected fault domains. Oracle recommends that you place each node of a 2-node RAC DB system in a different fault domain. For more information on fault domains, see Fault Domains.

Shapes for Virtual Machine DB Systems

When you launch a DB system, you choose a *shape*, which determines the resources allocated to the DB system.

The following table shows the available shapes for a virtual machine DB system on X7.

Shape	CPU Cores	Memory
VM.Standard2.1	1	15 GB
VM.Standard2.2	2	30 GB
VM.Standard2.4	4	60 GB
VM.Standard2.8	8	120 GB
VM.Standard2.16	16	240 GB
VM.Standard2.24	24	320 GB

The following table shows the available shapes for a virtual machine DB system on X5.see note

Shape	CPU Cores	Memory
VM.Standard1.1see note	1	7 GB
VM.Standard1.2see note	2	14 GB

Shape	CPU Cores	Memory
VM.Standard1.4[see note]	4	28 GB
VM.Standard1.8[see note]	8	56 GB
VM.Standard1.16[see note]	16	112 GB

Note: X5-based shapes availability is limited to monthly universal credit customers existing on or before November 9th, 2018, in the us-phoenix-1, us-ashburn-1, and eu-frankfurt-1 regions.

Storage Options for Virtual Machine DB Systems

Virtual machine DB systems use Oracle Cloud Infrastructure block storage. The following table shows details of the storage options for a virtual machine DB system. Total storage includes available storage plus recovery logs.

Available Storage (GB)	Total Storage (GB)
256	712
512	968
1024	1480
2048	2656
4096	5116
6144	7572
8192	10032
10240	12488
12288	14944

Available Storage (GB)	Total Storage (GB)
14336	17404
16384	19860
18432	22320
20480	24776
22528	27232
24576	29692
26624	32148
28672	34608
30720	37064
32768	39520
34816	41980
36864	44436
38912	46896
40960	49352

For 2-node RAC virtual machine DB systems, storage capacity is shared between the nodes.

Network Setup for DB Systems

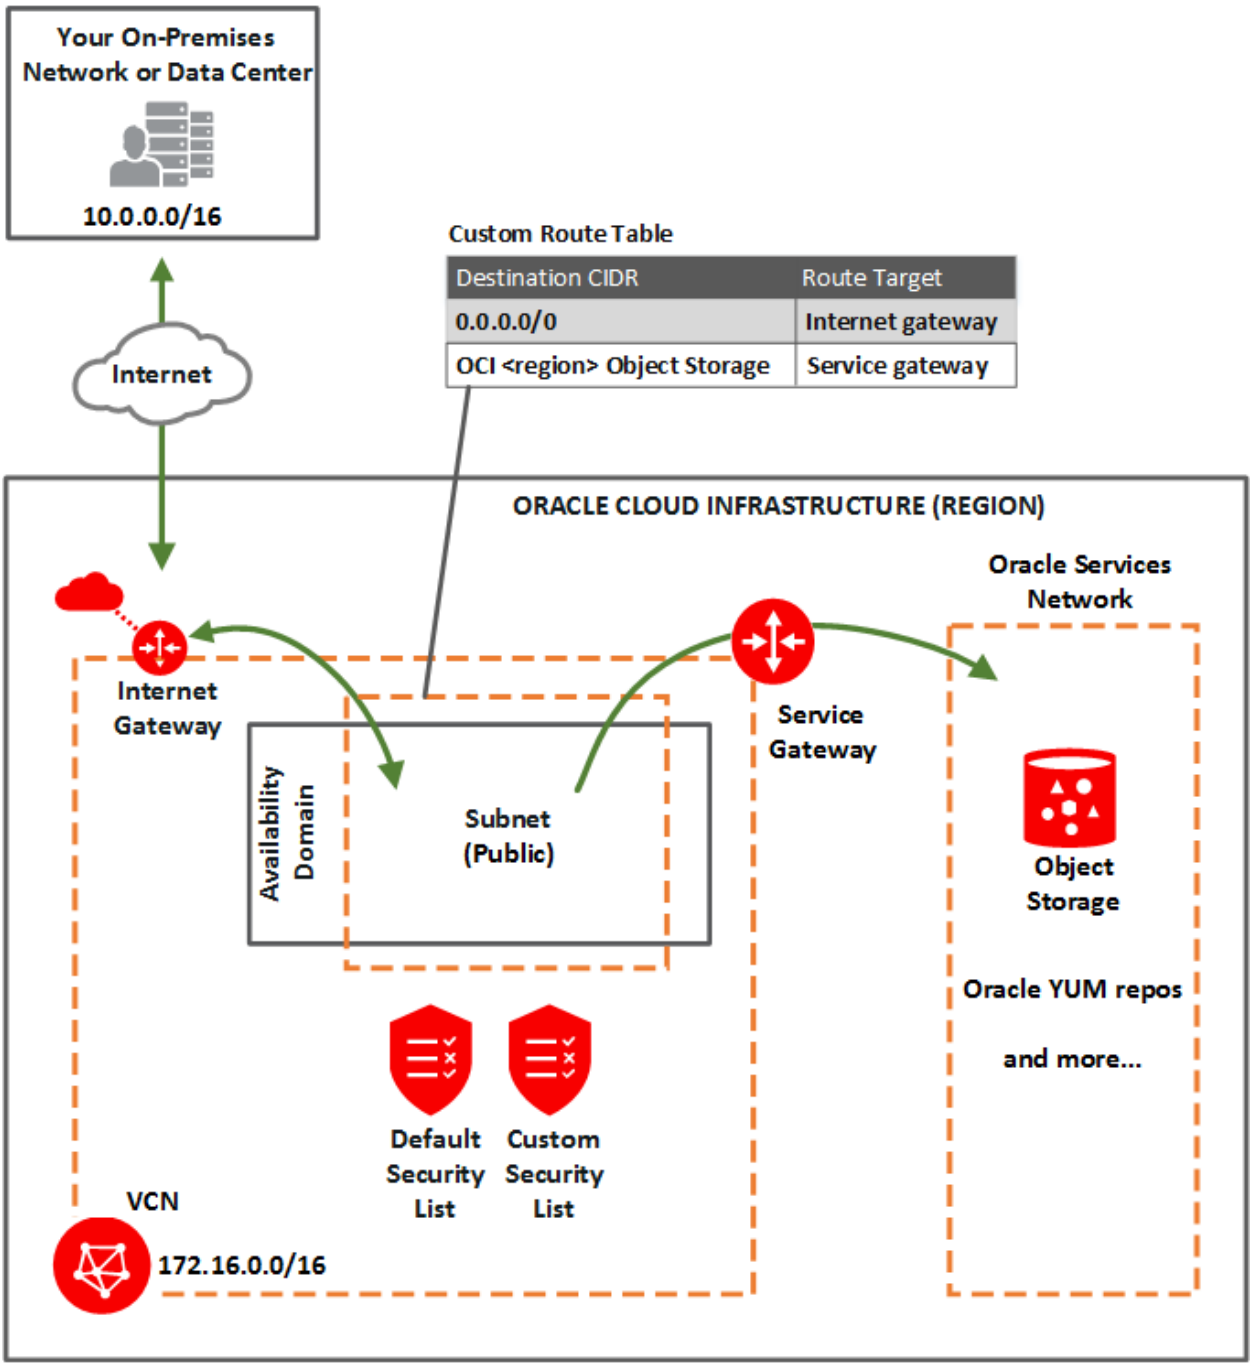
Note

This topic is not applicable to Exadata DB systems. For information on the network setup for an Exadata DB system, see Network Setup for Exadata DB Systems.

Before you set up a bare metal or virtual machine DB system, you must set up a virtual cloud network (VCN) and other Networking service components. This topic describes the recommended configuration for the VCN.

VCN and Subnets

To launch a DB system, you must have:



- A VCN in the region where you want the DB system
- At least one subnet in the VCN (either a public subnet or a private subnet)

In general, Oracle recommends using regional subnets, which span all availability domains in the region. For a bare metal or virtual machine DB system, either a regional subnet or AD-specific subnet works. For more information, see About Regional Subnets.

You will create a custom route table and security list for the subnet. More information follows about that.

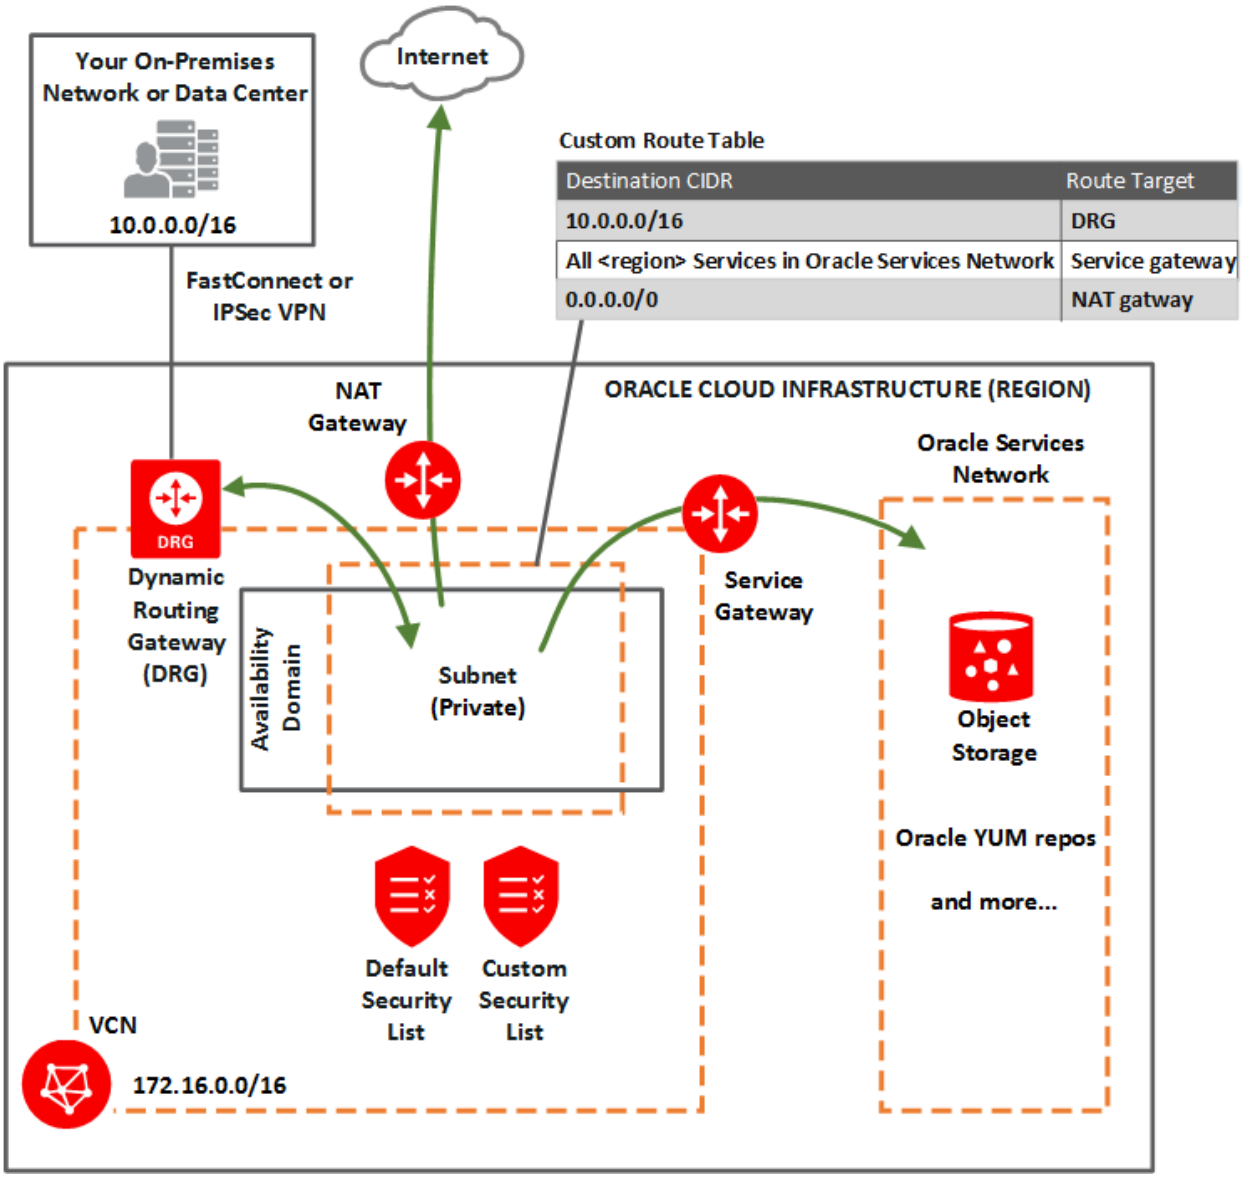
Option 1: Public Subnet with Internet Gateway

This option can be useful when doing a proof-of-concept or development work. You can use this setup in production if you want to use an internet gateway with the VCN, or if you have services that run only on a public network and need access to the database. See the following diagram and description.

Your On-Premises Network or Data Center
10.0.0.0/16
Internet
Custom Route Table
Destination CIDR
Route Target
0.0.0.0/0
Internet gateway
OCI <region> Object Storage
Service gateway
ORACLE CLOUD INFRASTRUCTURE (REGION)
Oracle Services Network
Internet Gateway
Service Gateway
Availability Domain
Subnet (Public)
Object Storage
Oracle YUM repos
and more...
Default Security List
Custom Security List
VCN
172.16.0.0/16

You set up:

- Public subnet.
- Internet gateway.
- Service gateway to reach Object Storage for database backups and patching. Also see Option 1: Service Gateway Access Only to Object Storage.
- Route table: A custom route table for the subnet, with two rules:
  - A rule for 0.0.0.0/0, and target = internet gateway.
  - A rule for the service CIDR label called **OCI *<region>* Object Storage**, and target = the service gateway. Also see Option 1: Service Gateway Access Only to Object Storage.
- Security lists:
  - Default security list (with its default rules) for the subnet. **This security list contains several basic rules that are necessary for the DB system (such as ingress SSH access to the DB system, and general egress from the DB system).**
  - Custom security list for the subnet. For the rules to use, see Security Lists for the Subnet.



Important

See this known issue for information about configuring route rules with *service gateway* as the target on route tables associated with public subnets.

Option 2: Private Subnet

This option is recommended for a production system. The subnet is private and cannot be reached from the internet. See the following diagram and description.

Your On-Premises Network or Data Center
10.0.0.0/16
Internet
FastConnect or IPSec VPN
Custom Route Table
Destination CIDR
Route Target
10.0.0.0/16
DRG
All <region> Services in Oracle Services Network
Service gateway
0.0.0.0/0
NAT gatway
ORACLE CLOUD INFRASTRUCTURE (REGION)
NAT Gateway
Oracle Services Network
DRG
Dynamic Routing Gateway (DRG)
Service Gateway
Availability Domain
Subnet (Private)
Object Storage
Oracle YUM repos
and more...
Default Security List
Custom Security List
VCN
172.16.0.0/16

You set up:

- Private subnet.
- Gateways for the VCN:
  - Dynamic routing gateway (DRG), with a FastConnect or IPSec VPN to your on-premises network.
  - Service gateway to reach Object Storage for database backups and patching, and to reach Oracle YUM repos for OS updates. Also see Option 2: Service Gateway Access to Both Object Storage and YUM Repos.
  - NAT gateway (to reach public endpoints not supported by the service gateway).
- Route table: A custom route table for the subnet, with these rules:
  - A route for the on-premises network's CIDR, and target = DRG.
  - A rule for the service CIDR label called **All *<region>* Services in Oracle Services Network**, and target = the service gateway. Also see Option 2: Service Gateway Access to Both Object Storage and YUM Repos.
  - If you want to access the Oracle YUM repos through the NAT gateway, add a route rule for the regional YUM repo's public IP address, and target = the NAT gateway. If you just use the next rule only, the traffic to the YUM repo would still be routed to the service gateway, because the service gateway route is more specific than 0.0.0.0/0.
  - A rule for 0.0.0.0/0, and target = NAT gateway.
- Security lists:
  - Default security list (with its default rules) for the subnet. **This security list contains several basic rules that are necessary for the DB system (such as ingress SSH access to the DB system, and general egress from the DB system).**
  - Custom security list for the subnet. For the rules to use, see Security Lists for the Subnet.

Requirements for IP Address Space

If you're setting up DB systems (and thus VCNs) in more than one region, make sure the IP address space of the VCNs does not overlap.

The subnet you create for a bare metal or virtual machine DB system cannot overlap with 192.168.16.16/28, which is used by the Oracle Clusterware private interconnect on the database instance.

The following table lists the *minimum* required subnet size.

Tip

The Networking service reserves three IP addresses in each subnet. Allocating a larger space for the subnet than the minimum required (for example, at least /25 instead of /28) can reduce the relative impact of those reserved addresses on the subnet's available space.

DB System Type	# Required IP Addresses	Minimum Subnet Size
1-node bare metal or virtual machine	1 + 3 reserved in subnet = 4	/30 (4 IP addresses)
2-node RAC virtual machine	(2 addresses * 2 nodes) + 3 for SCANs + 3 reserved in subnet = 10	/28 (16 IP addresses)

VCN Creation Wizard: Not for Production

The Networking section of the Console includes a handy wizard that creates a VCN along with related resources. It can be useful if you just want to try launching an instance. However, the wizard automatically chooses the address ranges and creates public subnets and an internet gateway. You may not want this for your production network, so Oracle recommends you create the VCN and other resources individually yourself instead of using the wizard.

DNS for a Bare Metal DB System

For a bare metal DB system, you must ensure that the system can resolve the Swift endpoints (for backing up databases, patching, and updating the DB system's cloud tooling) and Oracle

YUM repo endpoints. Resolution of these endpoints is automatically covered by the Internet and VCN Resolver, which is the VCN's default choice for DNS in the VCN. For more information, see DNS in Your Virtual Cloud Network and also DHCP Options.

DNS FOR A VIRTUAL MACHINE DB SYSTEM

This information is applicable to 1-node or 2-node virtual machine DB systems.

For the node or nodes to communicate, the VCN must use the Internet and VCN Resolver. It enables hostname assignment to the nodes, and DNS resolution of those hostnames by resources in the VCN. It also enables resolution of the database's Single Client Access Names (SCANs). Lastly, it also enables resolution of the Swift endpoints and Oracle YUM repo endpoints. The Internet and VCN Resolver is the VCN's default choice for DNS in the VCN. For more information, see DNS in Your Virtual Cloud Network and also DHCP Options.

When you create the VCN, subnet, and DB system, you must carefully set the following identifiers, which are related to DNS in the VCN:

- VCN domain label
- Subnet domain label
- Hostname prefix for the DB system

These values make up the node's fully qualified domain name (FQDN):

<hostname_prefix><RAC_node_#>.*<subnet_domain_label>*.*<vcn_domain_label>*.oraclevcn.com

For RAC systems only, the Database service automatically appends a node number after the hostname prefix.

For example:

- Node 1: `dbsys1.ad1.acmevcniad.oraclevcn.com`
- Node 2: `dbsys2.ad1.acmevcniad.oraclevcn.com`

Requirement for the hostname prefix:

- Maximum 16 characters
- Cannot be the string *localhost*

Requirements for the VCN and subnet domain labels:

- Recommended maximum: 15 characters
- No hyphens
- Recommended: include the region name in the VCN's name, and include the availability domain name in the subnet's name

The FQDN has a maximum total limit of 63 characters, so make sure you set the VCN and subnet domain labels short enough to meet that requirement. Here is a safe general rule:

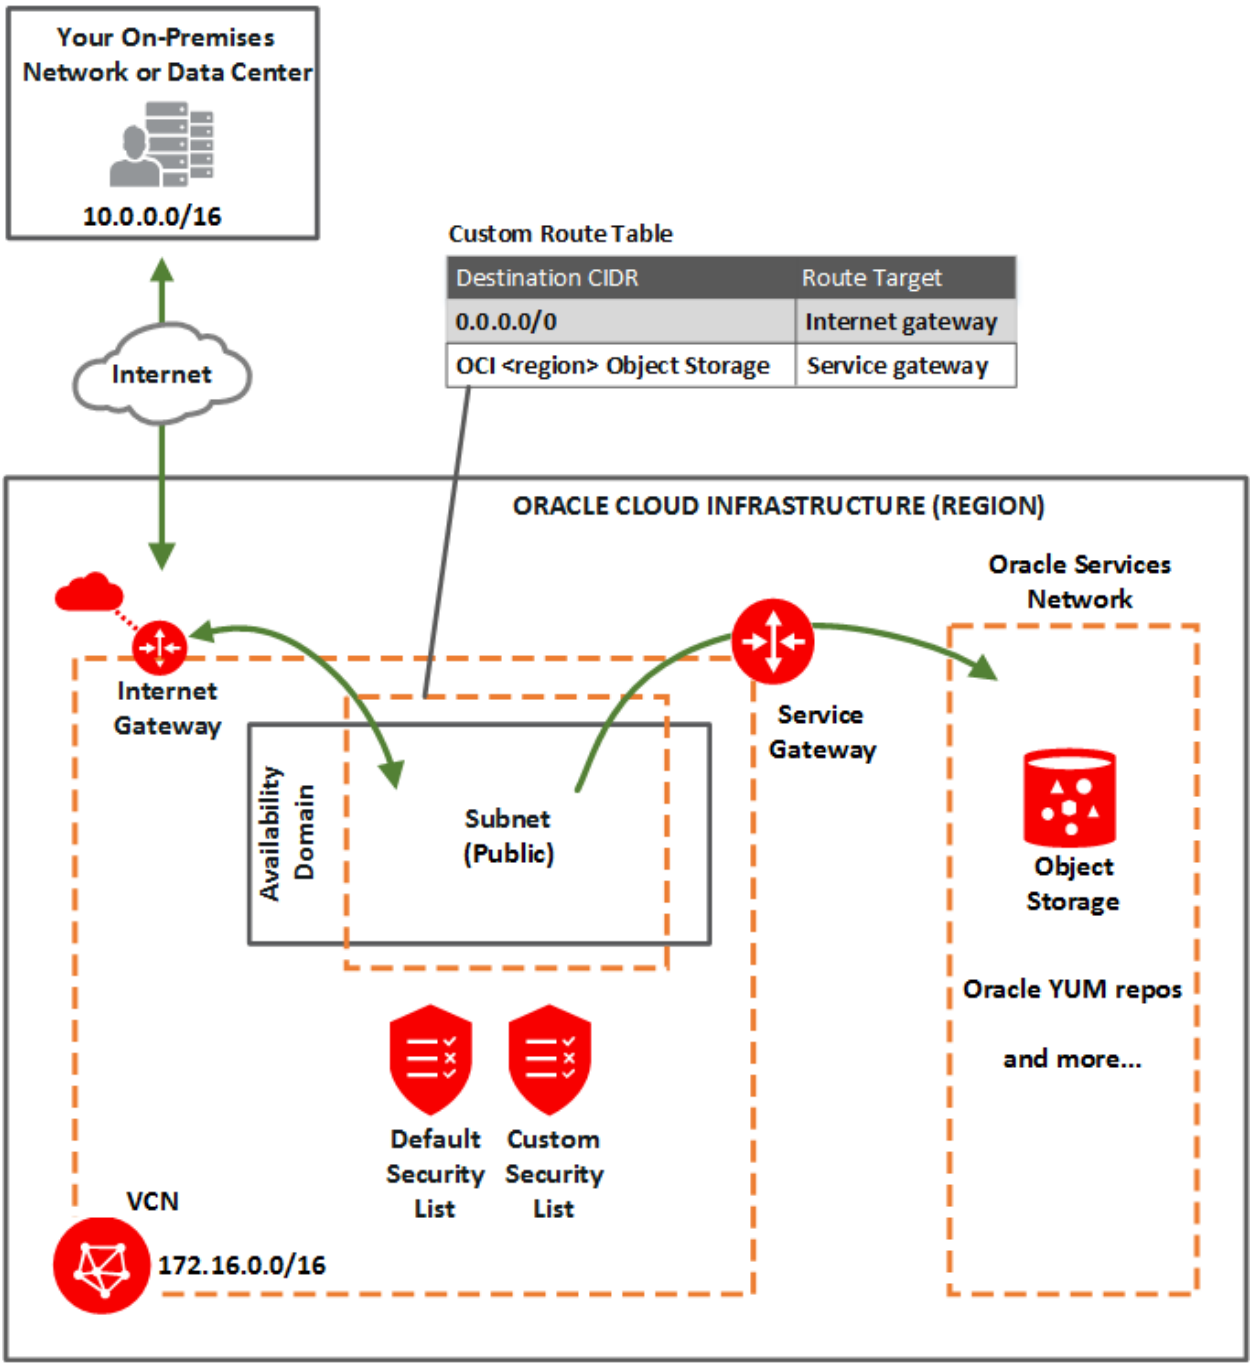
`<16_chars_max>#.<15_chars_max>.<15_chars_max>.oraclevcn.com`

The preceding maximums are not enforced when you create the VCN and subnets. However, the DB system deployment fails if the hostname prefix is greater than 16 characters or if the FQDN has more than 63 characters.

DNS: Between On-Premises Network and VCN

To enable the use of hostnames when on-premises hosts and VCN resources communicate with each other, you have two options:

- Set up an instance in the VCN to be a custom DNS server. For an example of an implementation of this scenario with the Oracle Terraform provider, see Hybrid DNS Configuration.
- Manage hostname resolution yourself manually.



Service Gateway for the VCN

Your VCN needs access to both Object Storage (for backing up databases, patching, and updating the cloud tooling on a DB system) and Oracle YUM repos for OS updates.

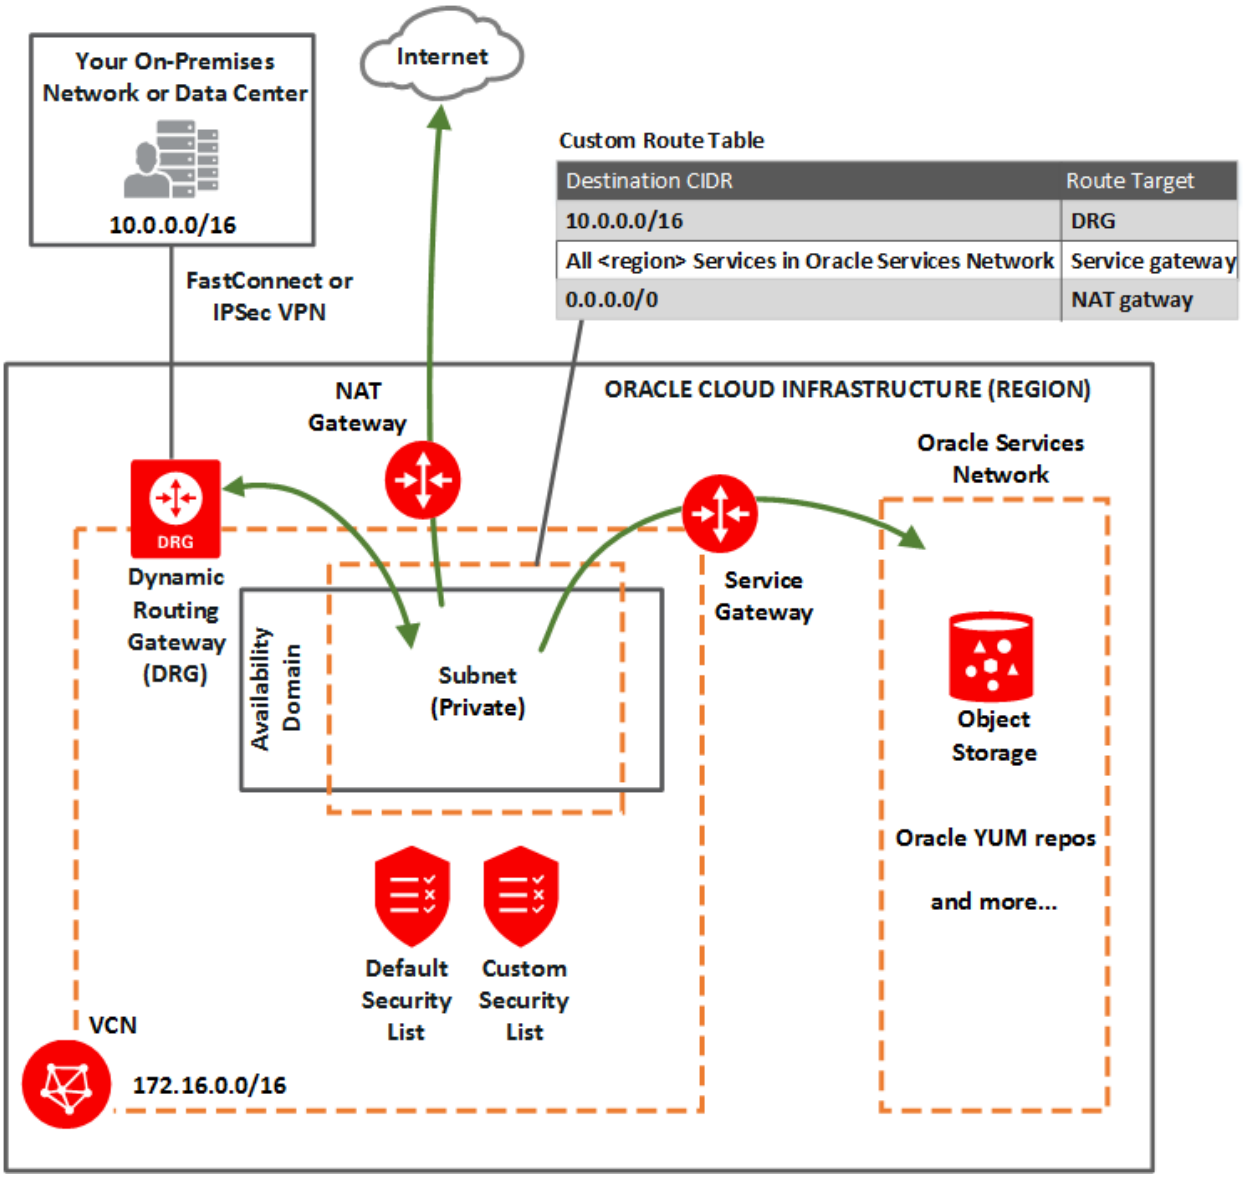
Depending on whether you use option 1 or option 2 described previously, you use the service gateway in different ways. See the next two sections.

Option 1: Service Gateway Access Only to Object Storage

You configure the subnet to use the service gateway for access only to Object Storage. As a reminder, here's the diagram for option 1:

Your On-Premises Network or Data Center
10.0.0.0/16
Internet
Custom Route Table
Destination CIDR
Route Target
0.0.0.0/0
Internet gateway
OCI <region> Object Storage
Service gateway
ORACLE CLOUD INFRASTRUCTURE (REGION)
Oracle Services Network
Internet Gateway
Service Gateway
Availability Domain
Subnet (Public)
Object Storage
Oracle YUM repos
and more...
Default Security List
Custom Security List
VCN
172.16.0.0/16

In general, you must:



- Perform the tasks for setting up a service gateway on a VCN, and specifically enable the service CIDR label called **OCI *<region>* Object Storage**.
- In the task for updating routing, add a route rule to the subnet's custom route table. For the destination service, use **OCI *<region>* Object Storage** and target = the service gateway.
- In the optional task for updating security lists in the subnet, perform the task on the subnet's custom security list. Here you set up a security list rule with the destination service set to **OCI *<region>* Object Storage**. See Security Lists for the Subnet.

Option 2: Service Gateway Access to Both Object Storage and YUM Repos

You configure the subnet to use the service gateway for access to the Oracle Services Network, which includes both Object Storage and the Oracle YUM repos.

> **Important**
>
> See this known issue for information about accessing Oracle YUM services through the service gateway.

As a reminder, here's the diagram for option 2:

In general, you must:

- Perform the tasks for setting up a service gateway on a VCN, and specifically enable the service CIDR label called **All *<region>* Services in Oracle Services Network**.
- In the task for updating routing in the subnet, add a rule to the subnet's custom route table. For the destination service, use **All *<region>* Services in Oracle Services Network** and target = the service gateway.
- In the optional task for updating security lists in the subnet, perform the task on the subnet's custom security list. Here you set up a security list rule with the destination service set to **All *<region>* Services in Oracle Services Network**. See Security Lists for the Subnet.

Security Lists for the Subnet

Oracle recommends that you use at least two security lists with the subnet:

- VCN's default security list (with all its default rules). **This security list contains several basic rules that are necessary for the DB system (such as ingress SSH access to the DB system, and general egress from the DB system).**
- Custom security list with the rules in the next section.

You must create the custom security list yourself. The VCN's default security list is automatically created when you create the VCN. When you create a subnet, you can choose which security lists the subnets will use, or you can choose the security lists after the subnet is created.

Warning

Do not remove the default egress rule from the default security list. If you do, make sure to instead include a replacement egress rule in the subnet's custom security list, like so:

- **Stateless:** No (all rules must be stateful)
- **Destination Type:** CIDR
- **Destination CIDR:** 0.0.0.0/0
- **IP Protocol:** All

RULES FOR THE CUSTOM SECURITY LIST

Create the following security list rules in the subnet's custom security list and associate the security list with the subnet.

Ingress rule 1: Allows inbound SSH access

This rule enables SSH access to the DB system. It is redundant with a default ingress rule in the default security list. It is optional but recommended in case the default security list's rules are inadvertently changed.

- **Stateless:** No (all rules must be stateful)
- **Source Type:** CIDR
- **Source CIDR:** 0.0.0.0/0
- **IP Protocol:** TCP
- **Source Port Range:** All
- **Destination Port Range:** 22

Ingress rule 2: Allows ONS and FAN traffic from within the VCN

This rule is recommended and enables the Oracle Notification Services (ONS) to communicate about Fast Application Notification (FAN) events.

- **Stateless:** No (all rules must be stateful)
- **Source Type:** CIDR
- **Source CIDR:** VCN's CIDR
- **IP Protocol:** TCP
- **Source Port Range:** All
- **Destination Port Range:** 6200

Ingress rule 3: Allows SQL*NET traffic from within the VCN

This rule is for SQL*NET traffic and is required only if you need to enable client connections to the database.

- **Stateless:** No (all rules must be stateful)
- **Source Type:** CIDR
- **Source CIDR:** VCN's CIDR
- **IP Protocol:** TCP
- **Source Port Range:** All
- **Destination Port Range:** 1521

Important

The preceding ingress rules 2 and 3 only cover connections initiated from within the VCN. If you have a client that resides *outside the VCN*, Oracle recommends setting up two *additional* similar rules that instead have

the **Source CIDR** set to the public IP address of the client.

Egress rule 1: Allows outbound SSH access

This rule enables SSH access between nodes in a 2-node DB system. It is redundant with the default egress rule in the default security list. It is optional but recommended in case the default security list's egress rule is inadvertently changed.

- **Stateless:** No (all rules must be stateful)
- **Destination Type:** CIDR
- **Destination CIDR:** 0.0.0.0/0
- **IP Protocol:** TCP
- **Source Port Range:** All
- **Destination Port Range:** 22

Egress rule 2: Allows access to Object Storage and YUM repos

The next rule enables the DB system to communicate with Object Storage alone (for option 1), or with the Oracle Services Network, which includes both Object Storage and the Oracle YUM repos (for option 2). This rule is redundant with the default egress rule in the default security list. It is optional but recommended in case the default security list's rules are inadvertently changed.

- **Stateless:** No (all rules must be stateful)
- **Destination Type:** Service
- **Destination Service:**

    - For option 1, use the service CIDR label called **OCI *<region>* Object Storage**
    - For option 2, use the service CIDR label called **All *<region>* Services in Oracle Services Network**
- **IP Protocol:** TCP
- **Source Port Range:** All
- **Destination Port Range:** 443 (HTTPS)

Managing Bare Metal and Virtual Machine DB Systems

This topic explains how to launch, start, stop, terminate, scale, manage licenses for, and check the status of a bare metal and virtual machine DB system, and set up DNS for a 1-node or 2-node RAC DB system.

When you launch a DB system using the Console, the API, or the CLI, the system is provisioned to support Oracle databases and an initial database is created based on the options you provide and some default options described later in this topic.

Warning

Avoid entering confidential information when assigning descriptions, tags, or friendly names to your cloud resources through the Oracle Cloud Infrastructure Console, API, or CLI.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let database admins manage database systems lets the specified group do everything with databases and related Database resources.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for databases, see Details for the Database Service.

Prerequisites

You'll need the following items to launch any DB system.

- The public key, in OpenSSH format, from the key pair that you plan to use for connecting to the DB System via SSH. A sample public key, abbreviated for readability, is shown below.

  ```
  ssh-rsa AAAAB3NzaC1yc2EAAAABJQAA....lo/gKMLVM2xzc1xJr/Hc26biw3TXWGEakrK1OQ== rsa-key-20160304
  ```

  For more information, see Managing Key Pairs on Linux Instances.
- A correctly configured virtual cloud network (VCN) to launch the DB system in. Its related networking resources (gateways, route tables, security lists, DNS, and so on) must also be configured as necessary for the DB system. For more information, see Network Setup for DB Systems.
- If you plan to back up your DB system to Object Storage or to use the managed patching feature, Oracle recommends using a service gateway to enable access to Object Storage.
- For a 2-node RAC DB system, ensure that port 22 is open for both ingress and egress on the subnet, and that the security rules you create are stateful (the default), otherwise, the DB system might fail to provision successfully.

Default Options for the Initial Database

To simplify launching a DB system in the Console and when using the API, the following default options are used for the initial database and for any additional databases that you create. (Several advanced options such as Time Zone can be set when you can use the `dbcli` command line interface to create databases.)

- **Console Enabled:** False
- **Create Container Database:** False for version 11.2.0.4 databases. Otherwise, true.
- **Create Instance Only (for standby and migration):** False
- **Database Home ID:** Creates a new database home
- **Database Language:** AMERICAN
- **Database Sizing Template:** odb2
- **Database Storage:** ACFS for version 11.2.0.4 databases. Otherwise, ASM.
- **Database Territory:** AMERICA
- **Database Unique Name:** The user-specified database name and a system-generated suffix, for example, dbtst_phx1cs.
- **PDB Admin Name:** pdbuser (Not applicable for version 11.2.0.4 databases.)

For a list of the database options that you can set, see To launch a DB system.

Using the Console

To launch a DB system

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
3. Click **Launch DB System**.
4. In the **Launch DB System** dialog, enter the following:

   DB System Information

   - **Compartment:** By default, the DB system launches in your current compartment and you can use the network resources in that compartment. Click the **click here** link in the dialog box if you want to enable compartment selection for the DB system, network, and subnet resources.
   - **Display Name:** A friendly, display name for the DB system. The name doesn't

need to be unique. An Oracle Cloud Identifier (OCID) will uniquely identify the DB system.

- **Availability Domain:** The availability domain in which the DB system resides.
- **Shape Type:** The type of shape to use to launch the DB system. The shape type filters the list of available shapes to select from.
- **Shape:** The shape to use to launch the DB system. The shape determines the type of DB system and the resources allocated to the system.

Bare metal shapes

- **BM.DenseIO2.52:** Provides a 1-node DB system (one bare metal server), with up to 52 CPU cores, 768 GB memory, and eight 6.4 TB locally attached NVMe drives (51.2 TB total) to the DB system.
- **BM.DenseIO1.36:** *Limited availability.* Provides a 1-node DB system (one bare metal server), with up to 36 CPU cores, 512 GB memory, and nine 3.2 TB locally attached NVMe drives (28.8 TB total) to the DB system.
  Note: BM.DenseO1.36 is available only to monthly universal credit customers existing on or before November 9th, 2018. This shape is available only in the us-phoenix-1, us-ashburn-1, and eu-frankfurt-1 regions.

Virtual machine shapes

Virtual machine X7 shapes:

- **VM.Standard2.1:** Provides a 1-node DB system with 1 core.
- **VM.Standard2.2:** Provides a 1- or 2-node DB system with 2 cores.
- **VM.Standard2.4:** Provides a 1- or 2-node DB system with 4 cores.
- **VM.Standard2.8:** Provides a 1- or 2-node DB system with 8 cores.

- **VM.Standard2.16:** Provides a 1- or 2-node DB system with 16 cores.
- **VM.Standard2.24:** Provides a 1- or 2-node DB system with 24 cores.

Virtual machine X5 shapes:

- **VM.Standard1.1:** Provides a 1-node DB system with 1 core.
- **VM.Standard1.2:** Provides a 1- or 2-node DB system with 2 cores.
- **VM.Standard1.4:** Provides a 1- or 2-node DB system with 4 cores.
- **VM.Standard1.8:** Provides a 1- or 2-node DB system with 8 cores.
- **VM.Standard1.16:** Provides a 1- or 2-node DB system with 16 cores.

Note

- X5-based shapes availability is limited to monthly universal credit customers existing on or before November 9th, 2018, in the us-phoenix-1, us-ashburn-1, and eu-frankfurt-1 regions.
- VM.Standard1.1 and VM.Standard2.1 shapes cannot be used for 2-node RAC clusters.

- **Cluster Name:** A unique cluster name for a multi-node DB system. The name must begin with a letter and contain only letters (a-z and A-Z), numbers (0-9) and hyphens (-). The cluster name can be no longer than 11 characters and is not case sensitive.
- **Total Node Count:** *Virtual machine DB systems only.* The number of nodes in the DB system. The number depends on the shape you select. You can specify 1 or 2 nodes for virtual machine DB systems, except for VM.Standard2.1 and VM.Standard1.1, which are single-node DB systems.

- **Oracle Database Software Edition:** The database edition supported by the DB system. For bare metal systems, you can mix supported database releases on the DB system to include older database versions, but not editions. The database edition cannot be changed and applies to all the databases in this DB system. Virtual machine systems support only one database.
- **Available Storage Size:** *Virtual machine DB systems only.* The amount of Block Storage you wish to allocate to the virtual machine DB system.
- **Cluster Name:** A unique cluster name for a multi-node DB system. The name must begin with a letter and contain only letters (a-z and A-Z), numbers (0-9) and hyphens (-). The cluster name can be no longer than 11 characters and is not case sensitive.
- **CPU Core Count:** The number of CPU cores for the DB system. Displays only if you select a shape that allows you to configure the number of cores. The text below the field indicates the acceptable values for that shape. For a multi-node DB system, the core count is evenly divided across the nodes.
  Except for virtual machine DB systems, you can increase the CPU cores to accommodate increased demand after you launch the DB system.
- **License Type:** The type of license you want to use for the DB system. Your choice affects metering for billing.
  - **License included** means the cost of the cloud service includes a license for the Database service.
  - **Bring Your Own License (BYOL)** means you are an Oracle Database customer with an Unlimited License Agreement or Non-Unlimited License Agreement and want to use your license with Oracle Cloud Infrastructure. This removes the need for separate on-premises licenses and cloud licenses.
- **SSH Public Key:** The public key portion of the key pair you want to use for SSH access to the DB system. To provide multiple keys, paste each key on a new line. Make sure each key is on a single, continuous line. The length of the combined keys cannot exceed 10,000 characters.

- **Data Storage Percentage:** *For bare metal DB systems only.* The percentage (40% or 80%) assigned to DATA storage (user data and database files). The remaining percentage is assigned to RECO storage (database redo logs, archive logs, and recovery manager backups).
- **Available Storage Size:** *For virtual machine DB systems only.* The amount of block storage to allocate to the virtual machine DB system. Available storage can be scaled up or down as needed after provisioning your DB system.
- **Advanced Options**: *For bare metal DB systems only.*
    - **Disk Redundancy:** *For bare metal systems only.* The type of redundancy configured for the DB system.
        - **Normal** is 2-way mirroring, recommended for test and development systems.
        - **High** is 3-way mirroring, recommended for production systems.

NETWORK INFORMATION

- **Virtual Cloud Network Compartment:** The compartment containing the network in which to launch the DB system.
- **Virtual Cloud Network:** The VCN in which to launch the DB system.
- **Subnet Compartment:** The compartment containing a subnet within the cloud network to attach the DB system to.
- **Client Subnet:** The subnet to which the bare metal or virtual machine DB system should attach.

  For 1- and 2-node RAC DB systems: Do not use a subnet that overlaps with 192.168.16.16/28, which is used by the Oracle Clusterware private interconnect on the database instance. Specifying an overlapping subnet will cause the private interconnect to malfunction.
- **Hostname Prefix:** Your choice of host name for the bare metal or virtual machine DB system. The host name must begin with an alphabetic character, and can contain only alphanumeric characters and hyphens (-). The maximum number

of characters allowed for bare metal and virtual machine DB systems is 16.

Important

The host name must be unique within the subnet. If it is not unique, the DB system will fail to provision.

- **Host Domain Name:** The domain name for the DB system. If the selected subnet uses the Oracle-provided Internet and VCN Resolver for DNS name resolution, this field displays the domain name for the subnet and it can't be changed. Otherwise, you can provide your choice of a domain name. Hyphens (-) are not permitted.
- **Host and Domain URL:** Combines the host and domain names to display the fully qualified domain name (FQDN) for the database. The maximum length is 64 characters.

DATABASE INFORMATION

- **Database Name:** The name for the database. The database name must begin with an alphabetic character and can contain a maximum of eight alphanumeric characters. Special characters are not permitted.
- **Database Version:** The version of the initial database created on the DB system when it is launched. After the DB system is active, you can create additional databases on it. You can mix database versions on the DB system, but not editions.

  If you are launching a DB system with a virtual machine shape, you have option of selecting an older database version. Check **Display all database versions** to include older database versions in the drop-down list of database version choices. See Availability of Older Database Versions for Virtual Machine DB Systems for more information.

Note

When you display all database versions in the drop-down list, the latest database version of each release is represented twice in the list, as follows:

- Once using four numeric segments and the notation "(latest)" . For example: 12.2.0.1 (latest)
- Once using five numeric segments, without the "(latest)" notation. For example: 12.2.0.1.180417

- **PDB Name:** *Not applicable to version 11.2.0.4.* The name of the pluggable database. The PDB name must begin with an alphabetic character, and can contain a maximum of 8 alphanumeric characters. The only special character permitted is the underscore (_).
- **Database Admin Password:**
  A strong password for SYS, SYSTEM, TDE wallet, and PDB Admin. The password must be 9 to 30 characters and contain at least 2 uppercase, 2 lowercase, 2 numeric, and 2 special characters. The special characters must be _, #, or -. The password must not contain the username (SYS, SYSTEM, and so on) or the word "oracle" either in forward or reversed order and regardless of casing.
- **Confirm Database Admin Password:** Re-enter the Database Admin Password you specified.
- **Automatic Backup:** (Optional) If you enable automatic backups, you can choose one of the following preset retention periods: 7 days, 15 days, 30 days, 45 days, 60 days, or 90 days. The default selection is 30 days.

- **Database Workload:**
  Select the workload type that best suits your application.
  - **Online Transactional Processing (OLTP)** configures the database for a transactional workload, with a bias towards high volumes of random data access.
  - **Decision Support System (DSS)** configures the database for a decision support or data warehouse workload, with a bias towards large data scanning operations.
- **Character Set:** The character set for the database. The default is AL32UTF8.
  Advanced Options:
  - **Character Set:** The character set for the database. The default is AL32UTF8.
  - **National Character Set:** The national character set for the database. The default is AL16UTF16.
  - **Fault Domain:** The fault domain(s) in which the DB system resides. You can choose which fault domain to use for your DB system. For 2-node RAC DB systems, you can specify which two fault domains are to be used. Oracle recommends that you place each node of a 2-node RAC DB system in a different fault domain. For more information on fault domains, see Fault Domains.
- **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.

5. Click **Launch DB System**.
   The DB system appears in the list with a status of Provisioning. The DB system's icon changes from yellow to green (or red to indicate errors).
6. Wait for the DB system's icon to turn green, with a status of Available, and then click

the highlighted DB system name.
Details about the DB system are displayed.

7. Note the IP addresses; you'll need the private or public IP address, depending on network configuration, to connect to the DB system.

To launch a new DB system from a backup

Before you begin, note the following:

- When you launch a new DB system from a backup, the availability domain will be the same as where the backup is hosted.
- The shape you specify must be the same type as the database from which the backup was taken. For example, if you are using a backup of a 1-node database, then the DB system you select as your target must also be a 1-node DB system.
- The Oracle database software edition you specify must be an equal or greater edition than that of the backed up database.
- If you specify a virtual machine DB system shape, the Available Storage Size will default to the data size of the backup, rounded up to the closest storage size option. However, you can specify a larger storage size.
- If you are creating a database from an automatic backup, you may choose any level 0 weekly backup, or a level 1 incremental backup created after the most recent level 0 backup. For more information on automatic backups, see Automatic Incremental Backups

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Navigate to the backup you wish to use to create a new database. You can select a backup from a database details page, or select a backup that appears in your compartment's list of standalone backups.

To navigate to a database's list of backups

a. Find the DB system where the database is located, and click the system name to display details about it.
   A list of databases is displayed.
b. Find the database associated with the backup you wish to use, and click its name to display details about it.
   A list of backups is displayed in the default view of the database details. You can also access the list of backups for a database by clicking on **Backups** under **Resources**.

To navigate to the list of standalone backups for your current compartment

a. Click **Standalone Backups** under **Bare Metal, VM, and Exadata**.
b. In the list of standalone backups, find the backup you want to use to create the database.

4. Click the Actions icon (three dots) for the backup you are interested in, and then click **Create Database**.
5. In the **Create Database from Backup** dialog, enter the following:

   DB System Information

   - **DB System Information:** Select **Launch New DB System**.
   - **Display Name:** A friendly, display name for the DB system. The name doesn't need to be unique. An Oracle Cloud Identifier (OCID) will uniquely identify the DB system.
   - **Shape:** The shape to use to launch the DB system. The shape determines the type of DB system and the resources allocated to the system.
     The selected shape must support the same number of nodes as the DB system from which the backup was created.

Bare metal shapes

- **BM.DenseIO2.52:** Provides a 1-node DB system (one bare metal server), with up to 52 CPU cores, 768 GB memory, and eight 6.4 TB locally attached NVMe drives (51.2 TB total) to the DB system.
- **BM.DenseIO1.36:** *Limited availability.* Provides a 1-node DB system (one bare metal server), with up to 36 CPU cores, 512 GB memory, and nine 3.2 TB locally attached NVMe drives (28.8 TB total) to the DB system.
  Note: BM.DenseO1.36 is available only to monthly universal credit customers existing on or before November 9th, 2018. This shape is available only in the us-phoenix-1, us-ashburn-1, and eu-frankfurt-1 regions.

Virtual machine shapes)

Virtual machine X7 shapes:

- **VM.Standard2.1:** Provides a 1-node DB system with 1 core.
- **VM.Standard2.2:** Provides a 1- or 2-node DB system with 2 cores.
- **VM.Standard2.4:** Provides a 1- or 2-node DB system with 4 cores.
- **VM.Standard2.8:** Provides a 1- or 2-node DB system with 8 cores.
- **VM.Standard2.16:** Provides a 1- or 2-node DB system with 16 cores.
- **VM.Standard2.24:** Provides a 1- or 2-node DB system with 24 cores.

Virtual machine X5 shapes:

- **VM.Standard1.1:** Provides a 1-node DB system with 1 core.
- **VM.Standard1.2:** Provides a 1- or 2-node DB system with 2 cores.
- **VM.Standard1.4:** Provides a 1- or 2-node DB system with 4 cores.
- **VM.Standard1.8:** Provides a 1- or 2-node DB system with 8 cores.
- **VM.Standard1.16:** Provides a 1- or 2-node DB system with 16 cores.

Note

- X5-based shapes availability is limited to monthly universal credit customers existing on or before November 9th, 2018, in the us-phoenix-1, us-ashburn-1, and eu-frankfurt-1 regions.
- VM.Standard1.1 and VM.Standard2.1 shapes cannot be used for 2-node RAC clusters.

- **Total Node Count:** *Virtual machine DB systems only.* The number of nodes in the DB system. The number depends on the shape you select. You can specify 1 or 2 nodes for virtual machine DB systems, except for VM.Standard2.1 and VM.Standard1.1, which are single-node DB systems.
- **Oracle Database Software Edition:** The database edition supported by the DB system. For bare metal systems, you can mix supported database releases on the DB system to include older database versions, but not editions. The database edition cannot be changed and applies to all the databases in this DB system. Virtual machine systems support only one database.
- **Available Storage Size:** *Virtual machine DB systems only.* The amount of Block Storage you wish to allocate to the virtual machine DB system.
- **Cluster Name:** A unique cluster name for a multi-node DB system. The name must begin with a letter and contain only letters (a-z and A-Z), numbers (0-9) and hyphens (-). The cluster name can be no longer than 11 characters and is not case sensitive.
- **License Type:** The type of license you want to use for the DB system. Your choice affects metering for billing.

- **License included** means the cost of the cloud service includes a license for the Database service.
- **Bring Your Own License (BYOL)** means you are an Oracle Database customer with an Unlimited License Agreement or Non-Unlimited License Agreement and want to use your license with Oracle Cloud Infrastructure. This removes the need for separate on-premises licenses and cloud licenses.

- **SSH Public Key:** The public key portion of the key pair you want to use for SSH access to the DB system. To provide multiple keys, paste each key on a new line. Make sure each key is on a single, continuous line. The length of the combined keys cannot exceed 10,000 characters.
- **Data Storage Percentage:** *For bare metal DB systems only.* The percentage (40% or 80%) assigned to DATA storage (user data and database files). The remaining percentage is assigned to RECO storage (database redo logs, archive logs, and recovery manager backups).
- **Available Storage Size:** *For virtual machine DB systems only.* The amount of block storage to allocate to the virtual machine DB system. Available storage can be scaled up or down as needed after provisioning your DB system.

  If you are creating a DB system from a backup, the minimum value for available storage is determined by the size of the backup.
- **Advanced Options:**
  - **Disk Redundancy:** *For bare metal systems only.* The type of redundancy configured for the DB system.
    - **Normal** is 2-way mirroring, recommended for test and development systems.
    - **High** is 3-way mirroring, recommended for production systems.
  - **Fault Domain:** The fault domain(s) in which the DB system resides. You can choose which fault domain to use for your DB system. For 2-node RAC DB systems, you can specify which two fault domains are to be used. Oracle

recommends that you place each node of a 2-node RAC DB system in a different fault domain. For more information on fault domains, see Fault Domains.

Network Information

- **Virtual Cloud Network:** The VCN in which to launch the DB system.
- **Client Subnet:** The subnet to which the bare metal or virtual machine DB system should attach.

  For 1- and 2-node RAC DB systems: Do not use a subnet that overlaps with 192.168.16.16/28, which is used by the Oracle Clusterware private interconnect on the database instance. Specifying an overlapping subnet will cause the private interconnect to malfunction.
- **Hostname Prefix:** Your choice of host name for the bare metal or virtual machine DB system. The host name must begin with an alphabetic character, and can contain only alphanumeric characters and hyphens (-). The maximum number of characters allowed for bare metal and virtual machine DB systems is 16.

Important

The host name must be unique within the subnet. If it is not unique, the DB system will fail to provision.

Database Information

- **Database Name:** The name for the database. The database name must begin with an alphabetic character and can contain a maximum of eight alphanumeric characters. Special characters are not permitted.
- **Database Admin Password:**

A strong password for SYS, SYSTEM, TDE wallet, and PDB Admin. The password must be 9 to 30 characters and contain at least 2 uppercase, 2 lowercase, 2 numeric, and 2 special characters. The special characters must be _, #, or -. The password must not contain the username (SYS, SYSTEM, and so on) or the word "oracle" either in forward or reversed order and regardless of casing.

- **Confirm Database Admin Password:** Re-enter the Database Admin Password you specified.
- **Password for Transparent Data Encryption (TDE) Wallet or RMAN Encryption:** Enter either the TDE wallet password or the RMAN encryption password for the backup, whichever is applicable.

6. Click **Create Database**.
7. Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.

To check the status of a DB system

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB systems, find the system you're interested in and check its icon. The color of the icon and the text below it indicates the status of the system.
   - **Provisioning:** Yellow icon. Resources are being reserved for the DB system, the system is booting, and the initial database is being created. Provisioning can take several minutes. The system is not ready to use yet.
   - **Available:** Green icon. The DB system was successfully provisioned. A few minutes after the system enters this state, you can SSH to it and begin using it.

- **Terminating:** Gray icon. The DB system is being deleted by the terminate action in the Console or API.
- **Terminated:** Gray icon. The DB system has been deleted and is no longer available.
- **Failed:** Red icon. An error condition prevented the provisioning or continued operation of the DB system.

To view the status of a database node, under Resources, click **Nodes** to see the list of nodes. In addition to the states listed for a DB system, a node's status can be one of the following:

- **Starting:** Yellow icon. The database node is being powered on by the start or reboot action in the Console or API.
- **Stopping:** Yellow icon. The database node is being powered off by the stop or reboot action in the Console or API.
- **Stopped:** Yellow icon. The database node was powered off by the stop action in the Console or API.

You can also check the status of DB systems and database nodes by using the ListDbSystems or ListDbNodes API operations, which return the `lifecycleState` attribute.

To start, stop, or reboot a DB system

Tip

Oracle recommends that you run a Network Time Protocol (NTP) daemon to keep system clocks stable during rebooting. If you need information about an NTP daemon, see Setting Up "NTP (Network Time Protocol) Server" in RHEL/CentOS 7.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB systems, find the DB system you want to stop or start, and then click its name to display details about it.
4. In the list of nodes, click the Actions icon (three dots) for a node and then click one of the following actions:
   - **Start:** Restarts a stopped node. After the node is restarted, the **Stop** action is enabled.
   - **Stop:** Shuts down the node. After the node is powered off, the **Start** action is enabled.
   - **Reboot:** Shuts down the node, and then restarts it.

Note

- Resource billing differs between bare metal and virtual machine DB systems as follows:
  - **Bare metal DB systems** - The **Stop** state has no effect on the resources you consume. Billing continues for nodes that you stop, and related resources continue to apply against any relevant quotas. You must **Terminate** a DB system to remove its resources from billing and quotas.
  - **Virtual machine DB systems** - Stopping a node stops billing for all OCPUs associated with that node. Billing resumes if you restart the node.
- After you restart or reboot a node, the floating IP address might take several minutes to be updated and display in the Console.

To scale the CPU cores for a bare metal DB system

If a multi-node DB system requires more compute node processing power, you can scale up (burst) the number of enabled CPU cores in the system.

Note

You cannot change the number of CPU cores for a virtual machine DB system.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB systems, find the system you want to scale and click its highlighted name.
   The system details are displayed.
4. Click **Scale Up/Down** and then change the number in **Total CPU Core Count**. The text below the field indicates the acceptable values, based on the shape used when the DB system was launched.
5. Click **Scale Up/Down DB System**.

To scale up the storage for a virtual machine DB system

If a virtual machine DB system requires more block storage, you can increase the storage at any time without impacting the system.

Note

This procedure does not apply to bare metal DB systems.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.

A list of DB systems is displayed.

3. In the list of DB systems, find the system you want to scale up and click its highlighted name.
   The system details are displayed.
4. Click **Scale Storage Up**, and then select the new storage size from the drop-down list.
5. Click **Scale Storage Up**.

To terminate a DB system

Terminating a DB system permanently deletes it and any databases running on it.

Note

The database data is local to the DB system and will be lost when the system is terminated. Oracle recommends that you back up any data in the DB system prior to terminating it.

Terminating a DB system removes all automatic incremental backups of all databases in the DB system from Oracle Cloud Infrastructure Object Storage. Full backups remain in Object Storage as standalone backups which you can use to create a new database. See Recovering a Database from Object Storage.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. For the DB system you want to terminate, click the Actions icon (three dots) and then click **Terminate**.

4. Confirm when prompted. .
   The DB system's icon indicates Terminating.

At this point, you cannot connect to the system and any open connections will be terminated.

To manage your BYOL database licenses

If you want to control the number of database licenses that you run at any given time, you can scale up or down the number of OCPUs on the instance. These additional licenses are metered separately.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB systems, find the system you want to scale and click its highlighted name.
   The system details are displayed.
4. Click **Scale Up/Down OCPU**, and then change the number.

To manage tags for your DB systems and database resources

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
3. Find the DB system or database resource you're interested in, and click the name.
4. Click the **Tags** tab to view or edit the existing tags. Or click **Apply Tag(s)** to add new ones.

For more information, see Resource Tags.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage DB system components.

DB systems:

- ListDbSystems
- GetDbSystem
- LaunchDbSystem
- TerminateDbSystem

Database homes:

- ListDbHomes
- GetDbHome
- CreateDbHome
- DeleteDbHome

Databases:

- ListDatabases
- GetDatabase

Nodes:

- DbNodeAction: Use this operation to power cycle a node in the DB system.
- ListDbNodes
- GetDbNode

Shapes and database versions:

- ListDbSystemShapes
- ListDbVersions

For the complete list of APIs for the Database service, see Database Service API.

Setting up DNS for a DB System

DNS lets you use host names instead of IP addresses to communicate with a DB system. You can use the *Internet and VCN Resolver* (the DNS capability built into the VCN) as described in DNS in Your Virtual Cloud Network.

Alternatively, you can use your choice of DNS server. You associate the host name and domain name to the public or private IP address of the DB system. You can find the host and domain names and IP addresses for the DB system in the Oracle Cloud Infrastructure Console on the **Database** page.

To associate the host name to the DB system's public or private IP address, contact your DNS administrator and request a custom DNS record for the DB system's IP address. For example, if your domain is example.com and you want to use clouddb1 as the host name, you would request a DNS record that associates clouddb1.example.com to your DB system's IP address.

If you provide the public IP address to your DNS administrator as described above, you should also associate a custom domain name to the DB system's public IP address:

1. Register your domain name through a third-party domain registration vendor, such as register.com.
2. Resolve your domain name to the DB system's public IP address, using the third-party domain registration vendor console. For more information, refer to the third-party domain registration documentation.

Connecting to a DB System

This topic explains how to connect to an active DB system. How you connect depends on the client tool or protocol you use, the purpose of the connection, and how your cloud network is set up. You can find information on various networking scenarios in Overview of Networking,

but for specific recommendations on how you should connect to a database in the cloud, contact your network security administrator.

Prerequisites

This section describes prerequisites you'll need to perform various tasks in this topic.

- To use the Console or the API to get the default administration service connection strings, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in. See Authentication and Authorization for more information on user authorizations for the Oracle Cloud Infrastructure Database service.
- To connect to the database, you'll need the public or private IP address of the DB system. Use the private IP address to connect to the DB system from your on-premises network, or from within the virtual cloud network (VCN). This includes connecting from a host located on-premises connecting through a VPN or FastConnect to your VCN, or from another host in the same VCN. Use the DB System's public IP address to connect to the system from outside the cloud (with no VPN). You can find the IP addresses in the Oracle Cloud Infrastructure Console on the **Database** page.
- For Secure Shell (SSH) access to the DB system, you'll need the full path to the file that contains the private key associated with the public key used when the DB system was launched.

If you have problems connecting, see Troubleshooting Connection Issues.

Database Services and Connection Strings

Database services allow you to control client access to a database instance depending on the functionality needed. For example, you might need to access the database for administration purposes only or you might need to connect an application to the database. Connection strings are specific to a database service.

When you provision a DB system, a default database administration service is automatically created. For 12c and later Oracle Databases, this service is for administrating the database at the CDB level. Because this service provides limited functionality, it is not suitable for connecting an application. Oracle recommends that you create a default application service for the initial database after you create your DB system. For 12c and later Oracle Databases, application services connect at the PDB level. Here are some important functions an application service can provide:

- Workload identification
- Load balancing
- Application continuity and Transaction Guard
- Fast Application Notification
- Resource assignment based on the service name

For details about these and other High Availability capabilities, see Client Failover Best Practices for Highly Available Oracle Databases.

CREATING AN APPLICATION SERVICE

You use the `srvctl` utility to create an application service. Before you can connect to the service, you must start it.

To create an application service for a PDB or an 11g Oracle database

1. Log in to the DB system host as `opc`.
2. Switch to the oracle user, and set your environment to the Oracle Database you want to administer.

```
$ sudo su - oracle
$ . oraenv
ORACLE_SID = [oracle] ? <database_name>
The Oracle base has been set to /u01/app/oracle
```

3. Create the application service for the database. Include the `pdb` option only if you are creating an application service for a PDB.

```
$ srvctl add service
-db <DB_unique_name>
-pdb <PDB_name>
-service <app_service_name>
-role PRIMARY
-notification TRUE
-session_state dynamic
-failovertype transaction
-failovermethod basic
-commit_outcome TRUE
-failoverretry 30
-failoverdelay 10
-replay_init_time 900
-clbgoal SHORT
-rlbgoal SERVICE_TIME
-preferred <rac_node1>,<rac_node2>
-retention 3600
```

Note that the preferred option is required only for multi-node databases to specify the hostname of the node in the RAC.

4. Start the application service.

```
$ srvctl start service -db <DB_unique_name> -s <app_service_name>
```

For more information about services for a PDB, see Managing Services for PDBs.

Database Connection Strings

You must use the appropriate connection string to access a database administration or application service. You can use the Console or the API to get the string for connecting to the default administration service from within a VCN. For 12c and later Oracle Databases, this service is for administrating the database at the CDB level. The string is provided in both the Easy Connect and in the full connect descriptor (long) format. Use the long format for the connection if hostname resolution is not available. You can also use the long format to create an alias in the tnsnames.ora file.

For accessing a database service within the VCN, the connection string for a Real Application Cluster (RAC) DB system uses the Single Client Access Name (SCAN) while the connection string for single instance DB system uses the hostname instead.

The private SCAN name is a Round Robin DNS entry created when you launch a 2-node RAC DB system. The private SCAN name is resolvable only within the VCN. If the client and the database are in the same VCN, the connection mechanism is the same as an on-premises RAC database; all the features provided by VIPs and SCAN VIPs, such as server side load balancing and VIP failover, are available.

Note

If you manually change the DB_UNIQUE_NAME, DB_DOMAIN, or listener port on the DB system, the connection strings you see in the Console or API will not reflect your changes. Ensure that you use the actual values of these parameters when you make a connection.

To get the connection strings for the default administration service

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
3. Find the DB system you're interested in, and click the name.
4. Click **DB Connection**.
5. Click the applicable link to view or copy the connection string.

You can derive the connection strings for other database services by replacing part of the default application service connection string with the applicable values.

To derive the connection string for a PDB administration service or an application service

1. Follow the procedure to get the Easy Connect string for the default administration service. That string should have the following format:

```
<hostname|SCAN>:1521/<DB_unique_name>.<DB_domain>
```

2. Make the appropriate substitution:
   - For the PDB administration service, replace `DB_unique_name` with the PDB name.

     ```
     <hostname|SCAN>:1521/<PDB_name>.<DB_domain>
     ```

   - For an application service, replace `DB_UNIQUE_NAME` with the name of the application service.

     ```
     <hostname|SCAN>:1521/<app_service_name>.<DB_domain>
     ```

Connecting to a Database Service by Using SQL*Net

This section describes how to connect to a database service from a computer that has a SQL*Net client installed. Port 1521 must be open to support the SQL*Net protocol.

Connecting from Within the VCN

For security reasons, Oracle recommends that you connect to your database services from within the VCN. You can use this method whether you are connecting to an administration service or to an application service.

To connect using SQL*Plus, you run the following command using the applicable connection string:

```
sqlplus system/<password>@<connection_string>
```

Consider the following:

- If your system is not using the VCN Resolver, ensure that the DB system's hostname (for single-node systems) or SCAN name (for multi-node systems) can be resolved. See DNS in Your Virtual Cloud Network for information about DNS name resolution.
- For connecting to the administration service of a PDB, ensure that the PDB is open or the service will not be available.
- For connecting to an application service, ensure that the service is started. For Fast Application Notification to work, ensure that port 6200 can be reached. See Client Failover Best Practices for Highly Available Oracle Databases for information about Fast Application Notification.

CONNECTING FROM THE INTERNET

Although Oracle does not recommend connecting to your database from the Internet, you can connect to a database service by using a public IP address if port 1521 is open to the public for ingress.

To use this method, you run the following command using the public IP address instead of the hostname or SCAN in the connection string:

```
sqlplus system/<password>@<public_IP>:1521/<service_name>.<DB_domain>
```

Consider the following:

- SCANs and hostnames are not resolvable on the Internet, therefore load balancing and failover for multi-node DB systems, which rely on these names, cannot work.
- For multi-node DB systems, which normally use SCANs, you must specify the IP address of one of the RAC hosts to access the database.

> **Important**
>
> Do not use this method to connect to the database from within the VCN. Doing so negatively impacts performance because traffic to the database is routed out of the VCN and back in through the public IP address.

EXAMPLE: CONNECTING IN SQL DEVELOPER USING SQL*NET

Prerequisites:

- Ensure that port 1521 is open for the Oracle default listener. (You can do this by checking the DB system's security list.)
- If port 1521 is open only to hosts in the VCN, then you must run your SQL Developer client from a machine that has direct access to the VCN. If you are connecting to the database from the Internet instead, then the public IP address of your computer must be granted access to port 1521 in the security list. (Alternatively, the security list can

grant full access to port 1521, however, this is not recommended for security reasons.) You must use the public IP address of the host because connecting from the Internet does not support SCAN name resolution.

To connect from within the VCN

After the prerequisites are met, start SQL Developer and create a connection by supplying the following connection details:

- **Username:** sys as sysdba
- **Password:** The **Database Admin Password** that was specified in the **Launch DB System** dialog in the Console.
- **Hostname:** The hostname as it appears in the Easy Connect format of the connection string. (See Database Connection Strings for help with getting the connection string and identifying the hostname.)
- **Port:** 1521
- **Service name:** The concatenated name of the service and host domain name, for example, db1_phx1tv.example.com. You can identify this value as the last part of the Easy Connect string, *<service_name>.<DB_domain>*.

To connect from The Internet by using public IP addresses

You can use the node's public IP address to connect to the database if the database is in a VCN that has an internet gateway. However, there are important implications to consider:

- When the client uses the public IP address, the client bypasses the SCAN listener and reaches the node listener, so server side load balancing is not available.
- When the client uses the public IP address, it cannot take advantage of the VIP failover feature. If a node becomes unavailable, new connection attempts to the node will hang until a TCP/IP timeout occurs. You can set client side SQL*Net parameters to limit the TCP/IP timeout.

The following `tnsnames.ora` example shows a connection string that includes the CONNECT_TIMEOUT parameter. This parameter controls the TCP timeout for connecting to a node.

```
test=
  (DESCRIPTION =
    (CONNECT_TIMEOUT=3)
    (ADDRESS_LIST=
      (ADDRESS = (PROTOCOL = TCP)(HOST = <public_IP1>)(PORT = 1521))
      (ADDRESS = (PROTOCOL = TCP)(HOST = <public_IP2>)(PORT = 1521))
    )
    (CONNECT_DATA =
      (SERVER = DEDICATED)
      (SERVICE_NAME = <dbservice.subnetname.dbvcn.oraclevcn.com>)
    )
  )
```

For more information about using the CONNECT_TIMEOUT parameter, see Client Failover Best Practices for Highly Available Oracle Databases.

Connecting to a Database with a Public IP by Using SSH Tunneling

You can access the services of DB system databases with public IP addresses by using SSH tunneling. The main advantage of this method is that port 1521 does not need to be opened to the public internet. However, just like accessing the database with a public IP using a SQL*Net client, load balancing and failover for multi-node DB systems cannot work because they rely on SCANs and hostnames.

Oracle SQL Developer and Oracle SQLcL and are two tools that facilitate the use of tunneling for Oracle Database access.

To open a tunnel, and then connect to a database service by using SQLcL, you run commands like the following:

```
SQL> sshtunnel opc@<public_IP> -i <private_key> -L <local_port>:<private_IP>:1521
Using port:22
SSH Tunnel connected
SQL> connect system/<password>@localhost:<local_port>/<service_name>.<DB_domain>
```

See Oracle SQL Developer and Oracle SQLcL for information about these tools.

Connecting to a Database by Using SSH and the Bequeath Protocol

This method allows you to connect to the database without using the network listener. It should be used to connect only for administration purposes.

When connecting to a multi-node DB system, you'll SSH to each individual node in the cluster.

To connect from a UNIX-style system

Use the following SSH command to access the DB system:
`$ ssh -i <private_key> opc@<DB_system_IP_address>`

<private_key> is the full path and name of the file that contains the private key associated with the DB system you want to access.

Use the DB system's private or public IP address depending on your network configuration. For more information, see Prerequisites.

To connect from a Windows system

1. Open `putty.exe`.
2. In the **Category** pane, select **Session** and enter the following fields:
   - **Host Name (or IP address):** `opc@<DB_system_IP_address>`
     Use the DB system's private or public IP address depending on your network configuration. For more information, see Prerequisites.
   - **Connection type:** SSH
   - **Port:** 22
3. In the **Category** pane, expand **Connection**, expand **SSH**, and then click **Auth**, and browse to select your private key.
4. Optionally, return to the **Session** category screen and save this session information for reuse later.
5. Click **Open** to start the session.

To access a database after you connect

1. Log in as opc and then sudo to the grid user.

```
login as: opc

[opc@ed1db01 ~]$ sudo su - grid
```

2. List all the databases on the system.

```
root@ed1db01 ]# srvctl config database -v

cdbm01 /u02/app/oracle/product/12.1.0/dbhome_2 12.1.0.2.0
exadb /u02/app/oracle/product/11.2.0/dbhome_2 11.2.0.4.0
mmdb /u02/app/oracle/product/12.1.0/dbhome_3 12.1.0.2.0
```

3. Connect as the oracle user and get the details about one of the databases by using the `srvctl` command.

```
[root@ed1db01 ~]# su - oracle
[oracle@ed1db01 ~]$ . oraenv
ORACLE_SID = [oracle] ? cdbm01
The Oracle base has been set to /u02/app/oracle
[oracle@ed1db01 ~]$ srvctl config database -d cdbm01
Database unique name: cdbm01 <<== DB unique name
Database name:
Oracle home: /u02/app/oracle/product/12.1.0/dbhome_2
Oracle user: oracle
Spfile: +DATAC1/cdbm01/spfilecdbm01.ora
Password file: +DATAC1/cdbm01/PASSWORD/passwd
Domain: data.customer1.oraclevcn.com
Start options: open
Stop options: immediate
Database role: PRIMARY
Management policy: AUTOMATIC
Server pools:
Disk Groups: DATAC1,RECOC1
Mount point paths:
Services:
Type: RAC
Start concurrency:
```

```
Stop concurrency:
OSDBA group: dba
OSOPER group: racoper
Database instances: cdbm011,cdbm012 <<== SID
Configured nodes: ed1db01,ed1db02
Database is administrator managed
```

4. Set the ORACLE_SID and ORACLE_UNIQUE_NAME using the values from the previous step.

```
[oracle@ed1db01 ~]$ export ORACLE_UNIQUE_NAME=cdbm01
[oracle@ed1db01 ~]$ export ORACLE_SID=cdbm011
[oracle@ed1db01 ~]$ sqlplus / as sysdba

SQL*Plus: Release 12.1.0.2.0 Production on Wed Apr 19 04:10:12 2017

Copyright (c) 1982, 2014, Oracle. All rights reserved.

Connected to:
Oracle Database 12c EE Extreme Perf Release 12.1.0.2.0 - 64bit Production
With the Partitioning, Real Application Clusters, Automatic Storage Management, Oracle Label
Security,
OLAP, Advanced Analytics and Real Application Testing options
```

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the GetDatabase API operation to get the default administration service connection strings.

Troubleshooting Connection Issues

The following issues might occur when connecting to a DB system or database.

ORA-28365: Wallet is Not Open Error

For a 1-node DB system or 2-node RAC DB system, regardless of how you connect to the DB system, *before* you use OS authentication to connect to a database (for example, `sqlplus / as sysdba`) be sure to set the ORACLE_UNQNAME variable. Otherwise, commands that require the TDE wallet will result in the error `ORA-28365: wallet is not open`.

Note that this is not an issue when using a TNS connection because ORACLE_UNQNAME is automatically set in the database CRS resource.

SSH Access Stops Working

If the DB system's root volume becomes full, you might lose the ability to SSH to the system (the SSH command will fail with permission denied errors). Before you copy a large amount of data to the root volume, for example, to migrate a database, use the `dbcli create-dbstorage` command to set up storage on the system's NVMe drives and then copy the database files to that storage. For more information, see Setting Up Storage on the DB System.

What Next?

Before you begin updating your DB system, review the information in Updating a DB System.

For information about setting up an Enterprise Manager console to monitor your databases, see Monitoring a Database.

Updating a DB System

Note

This topic is not applicable to Exadata DB systems. For information on how to update an Exadata DB system, see Updating an Exadata DB System

This topic includes information and instructions on how to update the OS of a bare metal or virtual machine DB system.

Warning

- Review all of the information before you begin updating the system. Updating the operating system through methods not described on this page can cause permanent loss of access.
- Always back up your databases prior to updating your DB system's operating system.

Bash Profile Updates

Do not add interactive commands such as `oraenv`, or commands that might return an error or warning message, to the `.bash_profile` file for the grid or oracle users. Adding such commands can prevent Database service operations from functioning properly.

Essential Firewall Rules

For a 1-node DB system or 2-node RAC DB system, do not remove or modify the following firewall rules in `/etc/sysconfig/iptables`:

- The firewall rules for ports 1521, 7070, and 7060 allow the Database service to manage the DB system. Removing or modifying them can result in the Database Service no longer operating properly.
- The firewall rules for 169.254.0.2:3260 and 169.254.0.3:80 prevent non-root users from escalating privileges and tampering with the system’s boot volume and boot process. Removing or modifying these rules can allow non-root users to modify the system's boot volume.

OS Updates

Before you update the OS, review the following important guidelines and information:

- Back up your DB system's databases prior to attempting an OS update.
- Do not remove packages from a DB system. However, you might have to remove custom RPMs (packages that were installed after the system was provisioned) for the update to complete successfully.

Warning

Do not install NetworkManager on the DB system. Installing this package and rebooting the system results in severe loss of access to the system.

- Oracle recommends that you test any updates thoroughly before updating a production system.
- The image used to launch a DB system is updated regularly with the necessary patches. After you launch a DB system, you are responsible for applying the required OS security updates published through the Oracle public YUM server.
- To apply OS updates, the DB system's VCN must be configured to allow access to the YUM repository. For more information, see Network Setup for DB Systems.

To update the DB system OS

Note

You can update the OS on 2-node RAC virtual machine DB systems in a rolling fashion. Ensure that you stop the clusterware cleanly before starting the update process.

1. Log on to the DB system host as `opc`, and then sudo to the `root` user.

```
login as: opc
[opc@dbsys ~]$ sudo su -
```

2. Identify the host region by running the following command:

```
# curl -s http://169.254.169.254/opc/v1/instance/ |grep region
```

3. With the region you noted from the previous step, determine the region name, and perform the following two steps.
   See Regions and Availability Domains to look up the region name.

   a. Download the repo.

```
# wget https://swiftobjectstorage.<region_
name>.oraclecloud.com/v1/dbaaspatchstore/DBaaSOSPatches/oci_dbaas_ol6repo -O /tmp/oci_
dbaas_ol6repo
```

   This example output assumes the region is us-phoenix-1 (PHX).

```
# wget https://swiftobjectstorage.us-phoenix-
1.oraclecloud.com/v1/dbaaspatchstore/DBaaSOSPatches/oci_dbaas_ol6repo -O /tmp/oci_dbaas_
ol6repo
--2018-03-16 10:40:42-- https://swiftobjectstorage.us-phoenix-

```

4. Enable the repo for your region.
    a. Copy the repo file to the `/etc/yum.repos.d` directory.

    ```
    cp /tmp/oci_dbaas_ol6repo /etc/yum.repos.d/ol6.repo
    ```

    b. Modify the `ol6.repo` file to enable the repo for your region.

    ```
    vi /etc/yum.repos.d/ol6.repo

    [ol6_latest_PHX]
    name=Oracle Linux $releasever Latest ($basearch)
    baseurl=http://yum-phx.oracle.com/repo/OracleLinux/OL6/latest/$basearch/
    gpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-oracle
    gpgcheck=1
    enabled=1 <= Enabled.

    [ol6_UEKR4_PHX]
    name=Latest Unbreakable Enterprise Kernel Release 4 for Oracle Linux $releasever
    ($basearch)
    baseurl=http://yum-phx.oracle.com/repo/OracleLinux/OL6/UEKR4/$basearch/
    gpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-oracle
    ```

```
gpgcheck=1
enabled=1 <= Enabled.
```

5. Install yum-plugin-versionlock.

```
$ sudo su -
# yum repolist

  Installing : yum-plugin-versionlock-1.1.30-40.0.1.el6.noarch
                                                        1/1
  Verifying  : yum-plugin-versionlock-1.1.30-40.0.1.el6.noarch
                                                        1/1

Installed:
  yum-plugin-versionlock.noarch 0:1.1.30-40.0.1.el6

Complete!
```

Note

Ignore the `RPMDB` warning messages that refer to `oda-hw-mgmt`.

6. Copy and overwrite the existing version lock file.

```
cp /etc/yum/pluginconf.d/versionlock.list /etc/yum/pluginconf.d/versionlock.list-`date +%Y%m%d`
cp /tmp/versionlock.list /etc/yum/pluginconf.d/versionlock.list
```

   The initial version lock file should be empty. However, it is a good practice to back it up in case it is not and you need to refer to it later.

7. Run the update command.

```
# yum update

Uploading /boot/vmlinuz-4.1.12-112.14.13.el6uek.x86_64 to http://169.254.0.3/kernel
Uploading /boot/initramfs-4.1.12-112.14.13.el6uek.x86_64.img to http://169.254.0.3/initrd
Uploading /tmp/tmp5HjrRUcmdline to http://169.254.0.3/cmdline

Error activating kernel/initrd/cmdline: 502 - <html>
<head><title>502 Bad Gateway</title></head>
<body bgcolor="white">
<center><h1>502 Bad Gateway</h1></center>
</body>
</html>
```

Note

- Ignore the error activating message that results from running the update.
- An update will occur only if a versionlock file has a valid update available to apply to the DB system.

8. Restart the system.

```
$ sudo su -
# reboot
```

9. Run the following command to validate the update:

```
# uname -r
 4.1.12-112.14.13
```

In this example, then new kernel version is 4.1.12-112.14.13.

For information about applying Oracle database patches to a DB system, see Patching a DB System.

Configuring a DB System

This topic provides information to help you configure your DB System.

Network Time Protocol

Oracle recommends that you run a Network Time Protocol (NTP) daemon on your 1-node DB Systems to keep system clocks stable during rebooting. If you need information about an NTP daemon, see Setting Up "NTP (Network Time Protocol) Server" in RHEL/CentOS 7.

Oracle recommends that you configure NTP on both nodes in a 2-node RAC DB System to synchronize time across the nodes. If you do not configure NTP, then Oracle Clusterware configures and uses the Cluster Time Synchronization Service (CTSS), and the cluster time might be out-of-sync with applications that use NTP for time synchronization.

For information about configuring NTP on a version 12c database, see Setting Network Time Protocol for Cluster Time Synchronization. For a version 11g database, see Network Time Protocol Setting.

Transparent Data Encryption

All user-created tablespaces in a DB System database are encrypted by default, using Transparent Data Encryption (TDE).

- For version 12c databases, if you don't want your tablespaces encrypted, you can set the `ENCRYPT_NEW_TABLESPACES` database initialization parameter to `DDL`.
- On a 1- or 2-node RAC DB System, you can use the dbcli update-tdekey command to update the master encryption key for a database.

- You must create and activate a master encryption key for any PDBs that you create. After creating or plugging in a new PDB on a 1- or 2-node RAC DB System, use the `dbcli update-tdekey` command to create and activate a master encryption key for the PDB. Otherwise, you might encounter the error `ORA-28374: typed master key not found in wallet` when attempting to create tablespaces in the PDB. In a multitenant environment, each PDB has its own master encryption key which is stored in a single keystore used by all containers. For more information, see "Overview of Managing a Multitenant Environment" in the Oracle Database Administrator's Guide.
- For information about encryption on Exadata DB Systems, see Using Tablespace Encryption in Exadata Cloud Service.

For detailed information about database encryption, see the Oracle Database Security White Papers.

Patching a DB System

Note

This topic is not applicable to Exadata DB systems.

This topic explains how to perform patching operations on bare metal and virtual machine DB systems and database homes by using the Console, API, or the database CLI (DBCLI).

Currently, the following patches are available:

Version	DB System Patch	Database Patch
18.0.0.0	April 2019	April 2019, January 2019, October 2018, July 2018, April 2018
12.2.0.1	April 2019	April 2019, January 2019, October 2018, July 2018, April 2018

Version	DB System Patch	Database Patch
12.1.0.2	April 2019	April 2019, January 2019, October 2018, July 2018, April 2018
11.2.0.4	Not applicable	April 2019, January 2019, October 2018, July 2018, April 2018

For information about operating system updates, see OS Updates.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let database admins manage database systems lets the specified group do everything with databases and related Database resources.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for databases, see Details for the Database Service.

About Patching DB Systems

Because patching a system requires a reboot, plan to run the operations at a time when they will have minimal impact on users. To avoid system interruption, consider implementing a high availability strategy such as Oracle Data Guard. For more information, see Using Oracle Data Guard with the Database CLI.

Oracle recommends that you back up your database and test the patch on a test system before you apply the patch. For information about backing up the databases, see Backing Up a Database.

You must patch a DB system before you patch the databases within that system.

Prerequisites

The DB system requires access to the Oracle Cloud Infrastructure Object Storage service, including connectivity to the applicable Swift endpoint for Object Storage. Oracle recommends using a service gateway with the VCN to enable this access. For more information, see these topics:

- Network Setup for DB Systems: For information about setting up your VCN for the DB system, including the service gateway.
- https://cloud.oracle.com/infrastructure/storage/object-storage/faq: For information about the Swift endpoints to use.

Important

In addition to the prerequisites listed, ensure that the following conditions are met to avoid patching failures:

- The `/u01` directory on the database host file system has at least 15 GB of free space for the execution of patching processes.
- The Oracle Clusterware is up and running on the DB system.
- All nodes of the DB system are up and running.

See Patching Failures for details on problems that can result from not following these guidelines.

Using the Console

You can use the Console to view the history of patch operations on a DB system or an individual database, apply patches, and monitor the status of an operation.

Oracle recommends that you use the pre-check action to ensure your DB system or database home has met the requirements for the patch you want to apply.

PERFORMING PATCH OPERATIONS

To perform a patch operation on a DB system

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Find the DB system on which you want to perform a patch operation, and click its name to display details about it.
4. Under **Resources**, click **Patches**.
5. Review the list of patches.
6. Click the Actions icon (three dots) for the patch you are interested in, and then click one of the following actions:
   - **Pre-check:** Check for any prerequisites to make sure that the patch can be successfully applied.
   - **Apply:** Performs the pre-check, and then applies the patch.
7. Confirm when prompted.
8. In the list of patches, click the patch name to display its patch request and monitor the progress of the patch operation.
   While a patch is being applied, the patch's status displays as **Applying** and the DB system's status displays as **Updating**. If the operation completes successfully, the patch's status changes to **Applied** and the DB system's status changes to **Available**.

To perform a patch operation on a database

Before you perform this procedure, ensure that the latest patch was successfully applied to the DB system.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.

A list of DB systems is displayed.

3. Find the DB system where the database is located, and click the system name to display details about it.
   A list of databases is displayed.
4. Find the database on which you want to perform the patch operation, and click its name to display details about it.
5. Under **Resources**, click **Patches**.
6. Review the list of patches.
7. Click the Actions icon (three dots) for the patch you are interested in, and then click one of the following actions:
   - **Pre-check:** Check for any prerequisites to make sure that the patch can be successfully applied.
   - **Apply:** Performs the pre-check, and then applies the patch.
8. Confirm when prompted.
9. In the list of patches, click the patch name to display its patch request and monitor the progress of the patch operation.
   While a patch is being applied, the patch's status displays as **Applying** and the database's status displays as **Updating**. If the operation completes successfully, the patch's status changes to **Applied** and the database's status changes to **Available**.

VIEWING PATCH HISTORY

Each patch history entry represents an attempted patch operation and indicates whether the operation was successful or failed. You can retry a failed patch operation. Repeating an operation results in a new patch history entry.

Patch history views in the Console do not show patches that were applied by using command line tools like DBCLI or the Opatch utility.

To view the patch history of a DB system

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Find the DB system you are interested in, and click the system name to display details about it.
4. Under **Resources**, click **Patch History**.
   The history of patch operations for that DB system is displayed.

To view the patch history of a database

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Find the DB system where the database is located, and click the system name to display details about it.
   A list of databases is displayed.
4. Find the database you are interested in, and click its name to display details about it.
5. Under **Resources**, click **Patch History**.
   The history of patch operations for that database is displayed.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage patching DB systems and databases.

DB systems:

- ListDbSystemPatches
- ListDbSystemPatchHistoryEntries
- GetDbSystemPatch
- GetDbSystemPatchHistoryEntry
- UpdateDbSystem

Databases:

- ListDbHomePatches
- ListDbHomePatchHistoryEntries
- GetDbHomePatch
- GetDbHomePatchHistoryEntry
- UpdateDbHome

For the complete list of APIs for the Database service, see Database Service API.

Using the Database CLI

This topic explains how to use the command line interface on the DB system to patch a DB system. Patches are available from the Oracle Cloud Infrastructure Object Storage service. You'll use the `dbcli` commands to download and apply patches to some or all of the components in your system.

PREREQUISITES

For connecting to the DB system via SSH, you'll need the path to private key associated with the public key used when the DB system was launched.

You also need the public or private IP address of the DB system. Use the private IP address to connect to the DB system from your on-premises network, or from within the virtual cloud network (VCN). This includes connecting from a host located on-premises connecting through a VPN or FastConnect to your VCN, or from another host in the same VCN. Use the DB System's public IP address to connect to the system from outside the cloud (with no VPN).

You can find the IP addresses in the Oracle Cloud Infrastructure Console on the **Database** page.

To update the CLI with the latest commands

Update the CLI to ensure you have the latest patching commands (older DB systems might not include them).

1. SSH to the DB System.

```
ssh -i <private_key_path> opc@<db_system_ip_address>
```

2. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the root user's profile, which will set the PATH to the dbcli directory (`/opt/oracle/dcs/bin`).

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. Update the CLI by using the cliadm update-dbcli command.

```
[root@dbsys ~]# cliadm update-dbcli
{
  "jobId" : "dc9ce73d-ed71-4473-99cd-9663b9d79bfd",
  "status" : "Created",
  "message" : "Dcs cli will be updated",
  "reports" : [ ],
  "createTimestamp" : "January 18, 2017 10:19:34 AM PST",
  "resourceList" : [ ],
  "description" : "dbcli patching",
  "updatedTime" : "January 18, 2017 10:19:34 AM PST"
}
```

4. Wait for the update job to complete successfully. Check the status of the job by using the dbcli list-jobs command.

```
[root@dbsys ~]# dbcli list-jobs

ID                                       Description                    Created
          Status
---------------------------------------- ------------------------------ --------------------------
```

```
---------- ----------
dc9ce73d-ed71-4473-99cd-9663b9d79bfd     dbcli patching               January 18, 2017 10:19:34
AM PST    Success
```

To check for installed and available patches

1. SSH to the DB System.

   ```
   ssh -i <private_key_path> opc@<db_system_ip_address>
   ```

2. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the root user's profile, which will set the PATH to the dbcli directory (`/opt/oracle/dcs/bin`).

   ```
   login as: opc

   [opc@dbsys ~]$ sudo su -
   ```

3. Display the installed patch versions by using the dbcli describe-component command. If the **Available Version** column indicates a version number for a component, you should update the component.

   ```
   [root@dbsys ~]# dbcli describe-component
   System Version
   ---------------
   12.1.2.10.0

   Component Name                             Installed Version    Available Version
   ---------------------------------------- -------------------- --------------------
   OAK                                        12.1.2.10.0          up-to-date
   GI                                         12.1.0.2.161018      up-to-date
   ORADB12102_HOME1                           12.1.0.2.160719      12.1.0.2.161018
   ```

4. Display the latest patch versions available in Object Storage by using the dbcli describe-latestpatch command.

   ```
   [root@dbsys ~]# dbcli describe-latestpatch

   componentType   availableVersion
   --------------- --------------------
   gi              12.1.0.2.161018
   ```

```
db              11.2.0.4.161018
db              12.1.0.2.161018
oak             12.1.2.10.0
```

To patch server components

You can patch the Grid Infrastructure (GI) and storage management kit (OAK) server components.

1. SSH to the DB System.

   ```
   ssh -i <private_key_path> opc@<db_system_ip_address>
   ```

2. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the root user's profile, which will set the PATH to the dbcli directory (`/opt/oracle/dcs/bin`).

   ```
   login as: opc

   [opc@dbsys ~]$ sudo su -
   ```

3. Update the server components by using the dbcli update-server command.

   ```
   [root@dbsys ~]# dbcli update-server
   {
     "jobId" : "9a02d111-e902-4e94-bc6b-9b820ddf6ed8",
     "status" : "Created",
     "reports" : [ ],
     "createTimestamp" : "January 19, 2017 09:37:11 AM PST",
     "resourceList" : [ ],
     "description" : "Server Patching",
     "updatedTime" : "January 19, 2017 09:37:11 AM PST"
   }
   ```

   Note the job ID above.

4. Check the job output by using the dbcli describe-job command with the job ID.

   ```
   [root@dbsys ~]# dbcli describe-job -i 9a02d111-e902-4e94-bc6b-9b820ddf6ed8

   Job details
   ----------------------------------------------------------------
   ```

```
                     ID:  9a02d111-e902-4e94-bc6b-9b820ddf6ed8
            Description:  Server Patching

10:02:32 AM PST    Success
Updating GiHome version                  January 19, 2017 10:02:32 AM PST    January 19, 2017
10:02:38 AM PST    Success
```

5. Verify that the server components were updated successfully by using the dbcli describe-component command. The **Available Version** column should indicate `update-to-date`.

To patch database home components

1. SSH to the DB System.

```
ssh -i <private_key_path> opc@<db_system_ip_address>
```

2. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the

root user's profile, which will set the PATH to the dbcli directory (`/opt/oracle/dcs/bin`).

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. Get the ID of the database home by using the dbcli list-dbhomes command.

```
[root@dbsys ~]# dbcli list-dbhomes
ID                                   Name                DB Version Home Location
------------------------------------ ------------------  ---------- ------------------------------
------------
b727bf80-c99e-4846-ac1f-28a81a725df6 OraDB12102_home1   12.1.0.2
/u01/app/orauser/product/12.1.0.2/dbhome_1
```

4. Update the database home components by using the dbcli update-dbhome command and providing the ID from the previous step.

```
[root@dbsys ~]# dbcli update-dbhome -i b727bf80-c99e-4846-ac1f-28a81a725df6
{
  "jobId" : "31b38f67-f993-4f2e-b7eb-5bccda9901ae",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "January 20, 2017 10:08:48 AM PST",
  "resourceList" : [ ],
  "description" : "DB Home Patching: Home Id is 52e2e799-946a-4339-964b-c203dee35328",
  "updatedTime" : "January 20, 2017 10:08:48 AM PST"
}
```

Note the job ID above.

5. Check the job output by using the dbcli describe-job command with the job ID.

```
[root@dbsys ~]# dbcli describe-job -i 31b38f67-f993-4f2e-b7eb-5bccda9901ae

Job details
----------------------------------------------------------------
                     ID:  31b38f67-f993-4f2e-b7eb-5bccda9901ae

10:22:17 AM PST    Success
```

6. Verify that the database home components were updated successfully by using the dbcli describe-component command. The **Available Version** column should indicate `update-to-date`.

Applying Interim Patches

Note

This topic applies only to database homes in 1-node and 2-node RAC DB systems.

If you are required to apply an interim patch (previously known as a "one-off" patch) to fix a specific defect, follow the procedure in this section. You use the Opatch utility to apply an interim patch to a database home.

In the procedure example, the database home directory is **/u02/app/oracle/product/12.1.0.2/dbhome_1** and the patch number is **26543344**.

To apply an interim patch to a database home

1. Obtain the applicable interim patch from My Oracle Support.
2. Review the information in the patch README.txt file. This file might contain additional and/or custom instructions to follow to apply the patch successfully.
3. Use SCP or SFTP to place the patch on your target database.
4. Shut down each database that is running in the database home.

   ```
   srvctl stop database -db <db name> -stopoption immediate -verbose
   ```

5. Set the Oracle home environment variable to point to the target Oracle home.

   ```
   sudo su - oracle
   export ORACLE_HOME=/u02/app/oracle/product/12.1.0.2/dbhome_1
   ```

6. Change to the directory where you placed the patch, and unzip the patch.

   ```
   cd <work_dir_where_opatch_is stored>
   unzip p26543344_122010_Linux-x86-64.zip
   ```

7. Change to the directory with the unzipped patch, and check for conflicts.

   ```
   cd 26543344
   $ORACLE_HOME/OPatch/opatch prereq CheckConflictAgainstOHWithDetail -ph ./
   ```

8. Apply the patch.

   ```
   $ORACLE_HOME/OPatch/opatch apply
   ```

9. Verify the patch was applied successfully.

   ```
   $ORACLE_HOME/OPatch/opatch lsinventory -detail -oh $ORACLE_HOME
   ```

10. If the database home contains databases, restart them.

    ```
    $ORACLE_HOME/bin/srvctl start database -db <db_name>
    ```

    Otherwise, run the following command as root user.

    ```
    # /u01/app/<db_version>/grid/bin/setasmgidwrap o=/u01/app/oracle/product/<db_version>/dbhome_
    1/bin/oracle
    ```

11. If the readme indicates that the patch has a sqlpatch component, run the datapatch command against each database.
    Before you run datapatch, ensure that all pluggable databases (PDBs) are open. To open a PDB, you can use SQL*Plus to execute `ALTER PLUGGABLE DATABASE <pdb_name> OPEN READ WRITE;` against the PDB.

```
$ORACLE_HOME/OPatch/datapatch
```

Creating a Database

Note

This topic is not applicable to Virtual Machine DB systems.

When you launch a bare metal DB system, an initial database is created in that system. You can create additional databases in that DB system at any time by using the Console or the API. You can create an empty database or reproduce a database by using a backup. Note that if you are creating a database from an automatic backup, you can choose any level 0 weekly backup, or a level 1 incremental backup created after the most recent level 0 backup. For more information on automatic backups, see Automatic Incremental Backups.

The database edition will be the edition of the DB system in which the database is created, and each new database is created in a separate database home.

Warning

Avoid entering confidential information when assigning descriptions, tags, or friendly names to your cloud resources through the Oracle Cloud Infrastructure Console, API, or CLI.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let database admins manage database systems lets the specified group do everything with databases and related Database resources.

If you're new to policies, see Getting Started with Policies and Common Policies. If you want to dig deeper into writing policies for databases, see Details for the Database Service.

Using the Console

To create a new database in an existing DB system

Note

The database that you create will be the same edition as the initial database in the DB system.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB systems, find the DB system in which you want to create the database, and then click its name to display details about it.
4. Click **Create Database**.

5. In the **Create Database** dialog, enter the following:
    - **Database Name:** The name for the database. The database name must begin with an alphabetic character and can contain a maximum of eight alphanumeric characters. Special characters are not permitted.
    - **Database Version:** The version of the database. You can mix database versions on the DB system, but not editions.
    - **PDB Name** (Optional) For version 12.1.0.2 and later, you can specify the name of the pluggable database. The PDB name must begin with an alphabetic character, and can contain a maximum of 8 alphanumeric characters. The only special character permitted is the underscore (_).
    - **Admin Password:** A strong password for SYS, SYSTEM, TDE wallet, and PDB Admin. The password must be nine to thirty characters and contain at least two uppercase, two lowercase, two numeric, and two special characters. The special characters must be _, #, or -.
    - **Confirm Admin Password:** Re-enter the database admin password.
    - **Automatic Backup:** *Optional.* If you enable automatic backups, you can choose one of the following preset retention periods: 7 days, 15 days, 30 days, 45 days, 60 days, or 90 days. The default selection is 30 days.
    - **Database Workload:** Select the workload type that best suits your application.
        - **Online Transactional Processing (OLTP)** configures the database for a transactional workload, with a bias towards high volumes of random data access.
        - **Decision Support System (DSS)** configures the database for a decision support or data warehouse workload, with a bias towards large data scanning operations.
6. Optionally, you can specify the character set and/or national character set for this database. Click **Show Advanced Options** to set these parameters. The defaults are AL32UTF8 and AL16UTF16, respectively.

7. Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.
8. Click **Create Database**.

When the database creation is complete, the status changes from Provisioning to Available.

To create a database from a backup in an existing DB system

Before you begin, note the following:

- When you create a database from a backup, you can choose a different DB system and compartment. However, the availability domain will be the same as where the source database is hosted.

Tip

You can use the GetBackup API to obtain information about the availability domain of the backup.

- The DB system you specify must support the same type as the system from which the backup was taken. For example, if the backup is from a single-node database, then the target DB system must be a single-node shape.
- The version of the target DB system must be the same or higher than the version of the backup.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.

3. Navigate to the backup you wish to use to create a new database. You can select a backup from a database details page, or select a backup that appears in your compartment's list of standalone backups.

Tip

If you are creating a database from an automatic backup, you may choose any level 0 weekly backup, or a level 1 incremental backup created after the most recent level 0 backup. For more information on automatic backups, see Automatic Incremental Backups.

To navigate to a database's list of backups

a. Find the DB system where the database is located, and click the system name to display details about it.
   A list of databases is displayed.

b. Find the database associated with the backup you wish to use, and click its name to display details about it.
   A list of backups is displayed in the default view of the database details. You can also access the list of backups for a database by clicking on **Backups** under **Resources**.

To navigate to the list of standalone backups for your current compartment

a. Click **Standalone Backups** under **Bare Metal, VM, and Exadata**.

b. In the list of standalone backups, find the backup you want to use to create the database.

4. Click the Actions icon (three dots) for the backup you are interested in, and then click **Create Database**.
5. In the **Create Database from Backup** dialog, enter the following:
    - **DB System:** The DB system in which you want to create the database. You must have the **Use Existing DB System** radio button selected to see the drop-down list of DB system choices.

      Note

      You cannot create a new database in the same DB system in which the database used to create the backup resides.

    - **Database Name:** The name for the database. The database name must begin with an alphabetic character and can contain a maximum of eight alphanumeric characters. Special characters are not permitted.
    - **Database Admin Password:** A strong password for SYS, SYSTEM, TDE wallet, and PDB Admin. The password must be 9 to 30 characters and contain at least 2 uppercase, 2 lowercase, 2 numeric, and 2 special characters. The special characters must be _, #, or -. The password must not contain the username (SYS, SYSTEM, and so on) or the word "oracle" either in forward or reversed order and regardless of casing.
    - **Confirm Database Admin Password:** Re-enter the Database Admin Password you specified.
    - **Password for Transparent Data Encryption (TDE) Wallet or RMAN Encryption:** Enter either the TDE wallet password or the RMAN encryption password for the backup, whichever is applicable.
6. Click **Create Database from Backup**.
7. Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you

must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.

To terminate a database

You'll get the chance to back up the database prior to terminating it. This creates a standalone backup that can be used to create a database later. Oracle recommends that you create this final backup for any production (non-test) database.

Note

Terminating a database removes all automatic incremental backups of the database from Oracle Cloud Infrastructure Object Storage. However, all full backups that were created on demand, including your final backup, will persist as standalone backups.

You cannot terminate a database that is assuming the primary role in a Data Guard association. To terminate it, you can switch it over to the standby role.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. In the list of DB Systems, find the DB System that contains the database you want to terminate, and then click its name to display details about it.
4. In the list of databases, find the database, click the Actions icon (three dots) and then click **Terminate**.
5. In the confirmation dialog, indicate whether you want to back up the database before terminating it, and type the name of the database to confirm the termination.

6. Click **Terminate Database**.
   The database's status indicates Terminating.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage databases.

Database homes:

- ListDbHomes
- GetDbHome
- CreateDbHome
- DeleteDbHome

Databases:

- ListDatabases
- GetDatabase

For the complete list of APIs for the Database service, see Database Service API.

Monitoring a Database

This topic explains how to set up an:

- Enterprise Manager Express console to monitor a version 12.1.0.2 or later database
- Enterprise Manager Database Control console to monitor a version 11.2.0.4 database

Each console is a web-based database management tool inside the Oracle database. You can use the console to perform basic administrative tasks such as managing user security, memory, and storage, and view performance information.

Required IAM Policy

Some of the procedures below require permission to create or update security lists. For more information about security list policies, see Security Lists.

Monitoring a Database with Enterprise Manager Express

On 1- and 2-node RAC DB Systems, by default, the EM Express console is not enabled on version 18.1.0.0, 12.2.0.1, and 12.1.0.2 databases. You can enable it for an existing database as described below, or you can enable it when you create a database by using the dbcli create-database command with the `-co` parameter.

You must also update the security list and iptables for the DB system as described later in this topic.

When you enable the console, you'll set the port for the console. The procedure below uses port 5500, but each additional console enabled on the same DB system will have a different port.

To enable the EM Express console and determine its port number

1. SSH to the DB system, log in as opc, sudo to the oracle user, and log in to the database as SYS.

   ```
   sudo su - oracle
   . oraenv
    <provide the database SID at the prompt>
   sqlplus / as sysdba
   ```

2. Do one of the following:

   - To enable the console and set its port, use the following command.

     ```
     exec DBMS_XDB_CONFIG.SETHTTPSPORT(<port>);
     ```

     For example:

     ```
     SQL> exec DBMS_XDB_CONFIG.SETHTTPSPORT(5500);

     PL/SQL procedure successfully completed.
     ```

- To determine the port for a previously enabled console, use the following command.

```
select dbms_xdb_config.getHttpsPort() from dual;
```

For example:

```
SQL> select dbms_xdb_config.getHttpsPort() from dual;

DBMS_XDB_CONFIG.GETHTTPSPORT()
------------------------------
                          5500
```

3. Return to the operating system by typing `exit` and then confirm that the listener is listening on the port:

```
lsnrctl status | grep HTTP

(DESCRIPTION=(ADDRESS=(PROTOCOL=tcps)(HOST=xxx.us.oracle.com)(PORT=5500))(Security=(my_wallet_
directory=/u01/app/oracle/admin/prod/xdb_wallet))(Presentation=HTTP)(Session=RAW))
```

4. If you're using a 2-node RAC DB system, see To set the required permissions on a 2-node RAC DB system.
5. Open the console's port as described in Opening Ports on the DB System.
6. Update the security list for the console's port as described in Updating the Security List for the DB System.

To set the required permissions on a 2-node RAC DB system

If you're using a 2-node RAC DB system, you'll need to add read permissions for the asmadmin group on the wallet directory on *both* nodes in the system.

1. SSH to one of the nodes in the DB system, log in as opc, sudo to the grid user.

```
[opc@dbsysHost1 ~]$ sudo su - grid
[grid@dbsysHost1 ~]$ . oraenv
ORACLE_SID = [+ASM1] ?
The Oracle base has been set to /u01/app/grid
```

2. Get the location of the wallet directory, shown in red below in the command output.

```
[grid@dbsysHost1 ~]$ lsnrctl status | grep xdb_wallet

(DESCRIPTION=(ADDRESS=(PROTOCOL=tcps)(HOST=dbsysHost1.sub04061528182.dbsysapril6.oraclevcn.com)
(PORT=5500))(Security=(my_wallet_directory=/u01/app/oracle/admin/dbsys12_phx3wm/xdb_wallet))
(Presentation=HTTP)(Session=RAW))
```

3. Return to the opc user, switch to the oracle user, and change to the wallet directory.

```
[opc@dbsysHost1 ~]$ sudo su - oracle
[oracle@dbsysHost1 ~]$ cd /u01/app/oracle/admin/dbsys12_phx3wm/xdb_wallet
```

4. List the directory contents and note the permissions.

```
[oracle@dbsysHost1 xdb_wallet]$ ls -ltr
total 8
-rw------- 1 oracle asmadmin 3881 Apr  6 16:32 ewallet.p12
-rw------- 1 oracle asmadmin 3926 Apr  6 16:32 cwallet.sso
```

5. Change the permissions:

```
[oracle@dbsysHost1 xdb_wallet]$ chmod 640 /u01/app/oracle/admin/dbsys12_phx3wm/xdb_wallet/*
```

6. Verify that read permissions were added.

```
[oracle@dbsysHost1 xdb_wallet]$ ls -ltr
total 8
-rw-r----- 1 oracle asmadmin 3881 Apr  6 16:32 ewallet.p12
-rw-r----- 1 oracle asmadmin 3926 Apr  6 16:32 cwallet.sso
```

7. **Important!** Repeat the steps above on the other node in the cluster.

To connect to the EM Express console

After you've enabled the console and opened its port in the security list and iptables, you can connect as follows:

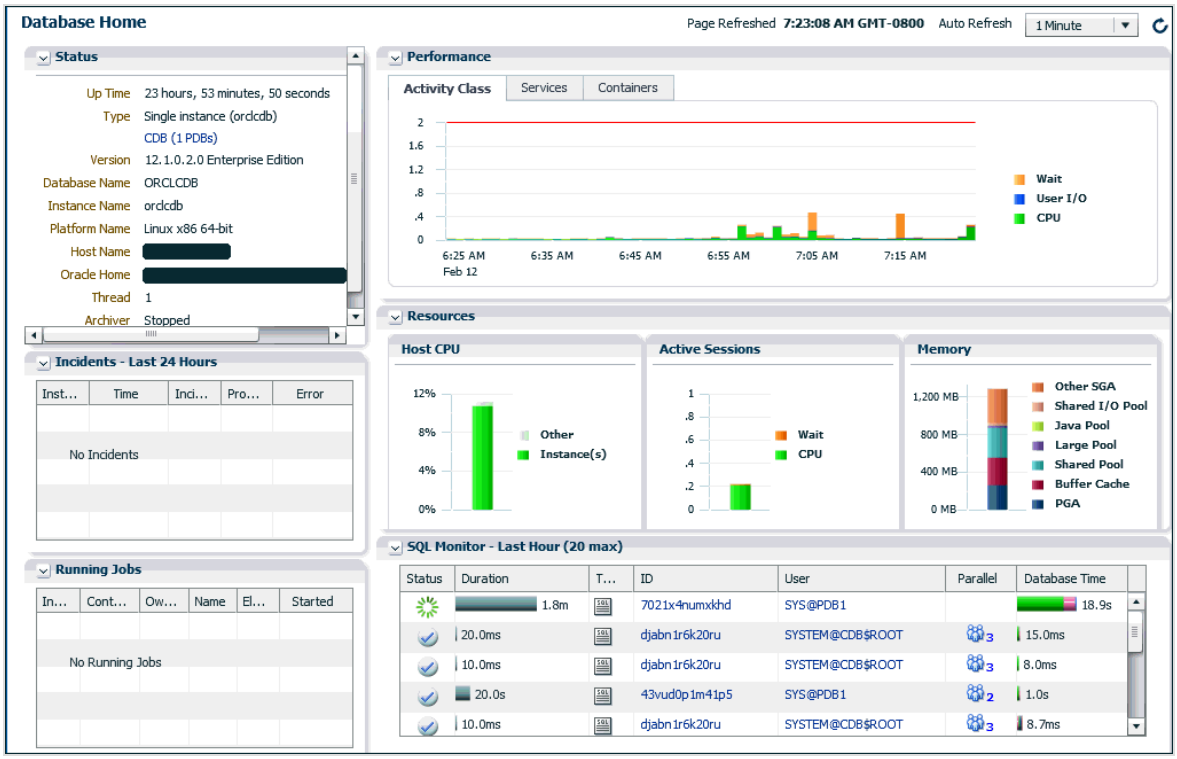
1. From a web browser, connect to the console using the following URL format:

```
https://<ip_address>:<port>/em
```

   For example, `https://129.145.0.164:5500/em`

Use the DB system's private or public IP address depending on your network configuration.

Use the private IP address to connect to the DB system from your on-premises network, or from within the virtual cloud network (VCN). This includes connecting from a host located on-premises connecting through a VPN or FastConnect to your VCN, or from another host in the same VCN.



Use the DB System's public IP address to connect to the system from outside the cloud (with no VPN).

You can find the IP addresses in the Oracle Cloud Infrastructure Console on the **Database** page.

2. A login page is displayed and you can log in with any valid database credentials.

The Database Home page is displayed.

To learn more about EM Express, see Introduction to Oracle Enterprise Manager Database Express.

Note

If you're using a 1-node DB system, and you are unable to connect to the EM Express console, see Database Known Issues.

Monitoring a Database with Enterprise Manager Database Control

By default, the Enterprise Manager Database Control console is not enabled on version 11.2.0.4 databases. You can enable the console:

- when you create a database by using the dbcli create-database with the `-co` parameter
- for an existing database as described here.

Port 1158 is the default port used for the first console enabled on the DB system, but each additional console enabled on the DB system will have a different port.

Note

For a version 11.2.0.4 database on a 2-node RAC DB system, see To enable the console for a version 11.2.0.4 database on a multi-node DB system .

To determine the port for the Enterprise Manager Database Control console

1. SSH to the DB system, log in as opc, and sudo to the oracle user.

```
sudo su - oracle
. oraenv
 <provide the database SID at the prompt>
```

2. Use the following command to get the port number.

```
emctl status dbconsole
```

The port is in the URL, as shown in the following example:

```
[oracle@dbsys ~]$ emctl status dbconsole
Oracle Enterprise Manager 11g Database Control Release 11.2.0.4.0
Copyright (c) 1996, 2013 Oracle Corporation.  All rights reserved.
https://dbprod:1158/em/console/aboutApplication
Oracle Enterprise Manager 11g is running.
------------------------------------------------------------------
```

```
Logs are generated in directory /u01/app/oracle/product/11.2.0.4/dbhome_2/dbprod_db11/sysman/log
```

3. Open the console's port as described in Opening Ports on the DB System.
4. Update the security list for the console's port as described in Updating the Security List for the DB System.

To connect to the Enterprise Manager Database Control console

After you've enabled the console and opened its port in the security list and iptables, you can connect as follows:

1. From a web browser, connect to the console using the following URL format:

   ```
   https://<ip_address>:<port>/em
   ```

   For example, `https://129.145.0.164:1158/em`

   Use the DB system's private or public IP address depending on your network configuration.

   Use the private IP address to connect to the DB system from your on-premises network, or from within the virtual cloud network (VCN). This includes connecting from a host located on-premises connecting through a VPN or FastConnect to your VCN, or from another host in the same VCN.

   Use the DB System's public IP address to connect to the system from outside the cloud (with no VPN).

   You can find the IP addresses in the Oracle Cloud Infrastructure Console on the **Database** page.
2. A login page will be displayed and you can log in with any valid database credentials.

To learn more about Enterprise Manager Database Control, see Introduction to Oracle Enterprise Manager Database Control.

To enable the console for a version 11.2.0.4 database on a multi-node DB system

A few extra steps are required to enable the console for a version 11.2.0.4 database on a

multi-node DB system.

Configure SSH Equivalency Between the Two Nodes

You'll create SSH keys on each node and copy the key to the other node, so that each node has the keys for both nodes. The following procedure uses the sample names node1 and node2.

1. SSH to node1, log in as opc, and sudo to the oracle user.

   ```
   sudo su - oracle
   ```

2. Create a directory called .ssh, set its permissions, create an RSA key, and add the public key to the `authorized_keys` file.

   ```
   mkdir .ssh
   chmod 755 .ssh
   ssh-keygen -t rsa
   cat id_rsa.pub > authorized_keys
   ```

3. Repeat the previous steps on the other node in the cluster.
4. On each node, add the `id_rsa.pub` key for the *other* node to the `authorized_keys` file. When you're done, you should see both keys in `authorized_keys` on each node.
5. On node1, create the `known_hosts` file by doing the following:
   - SSH to node1 and reply yes to the authentication prompt.
   - SSH to node2 and reply yes to the authentication prompt.
6. On node2, create the `known_hosts` file by doing the following:
   - SSH to node2 and reply yes to the authentication prompt.
   - SSH to node1 and reply yes to the authentication prompt.
7. On node1, verify that SSH equivalency is now configured by using the following Cluster Verification Utility (CVU) command.

   ```
   cluvfy stage -pre crsinst -n all -verbose
   ```

Configure the Console

1. On node1, create a file called emca.rsp with the following entries.

```
DB_UNIQUE_NAME=<pdb_unique_name>
SERVICE_NAME=<db_unique_name>.<db_domain>
PORT=<scan listener port>
LISTENER_OH=$GI_HOME
SYS_PWD=<admin password>
DBSNMP_PWD=<admin password>
SYSMAN_PWD=<admin password>
CLUSTER_NAME=<cluster name>     <=== to get the cluster name, run: $GI_HOME/bin/cemutlo -n
ASM_OH=$GI_HOME
ASM_SID=+ASM1
ASM_PORT=<asm listener port>
ASM_USER_NAME=ASMSNMP
ASM_USER_PWD=<admin password>
```

2. On node1, run Enterprise Manager Configuration Assistant (EMCA) using the emca.rsp file as input.

```
$ORACLE_HOME/bin/emca -config dbcontrol db -repos create -cluster -silent -respFile  <location of response file above>
```

3. On node2, configure the console so the agent in node1 reports to the console in node1, and the agent in node2 reports to the console in node2.

```
$ORACLE_HOME/bin/emca -reconfig dbcontrol -silent -cluster -EM_NODE <node2 host> -EM_NODE_LIST <node2 host> -DB_UNIQUE_NAME <db_unique_name>
 -SERVICE_NAME <db_unique_name>.<db_domain>
```

4. On each node, verify that console is working properly.

```
$ export ORACLE_UNQNAME=<db_unique_name>

$ emctl status agent

```

Update iptables and Security List

1. On each node, edit iptables to open the console's port as described in Opening Ports on the DB System.
2. Update the security list for the console's port as described in Updating the Security List for the DB System.

Opening Ports on the DB System

Open the following ports as needed on the DB system:

- 6200 - For Oracle Notification Service (ONS).
- 5500 - For EM Express. 5500 is the default port, but each additional EM Express console enabled on the DB system will have a different port. If you're not sure which port to open for a particular console, see Monitoring a Database with Enterprise Manager Express.
- 1158 - For Enterprise Manager Database Control. 1158 is the default port, but each additional console enabled on the DB system will have a different port. If you're not sure which port to open for a particular console, see Monitoring a Database with Enterprise Manager Database Control.

For important information about critical firewall rules, see Essential Firewall Rules.

To open ports on the DB system

1. SSH to the DB System.

```
ssh -i <private_key_path> opc@<db_system_ip_address>
```

2. Log in as opc and then sudo to the root user.

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. Save a copy of iptables as a backup.

```
[root@dbsys ~]# iptables-save > /tmp/iptables.orig
```

(If necessary, you can restore the original file by using the command `iptables-restore < /tmp/iptables.orig`.)

4. Dynamically add a rule to iptables to allow inbound traffic on the console port, as shown in the following sample. Change the port number and comment as needed.

```
[root@dbsys ~]# iptables -I INPUT 8 -p tcp -m state --state NEW -m tcp --dport 5500 -j ACCEPT -m comment --comment "Required for EM Express."
```

5. Make sure the rule was added.

```
[root@dbsys ~]# service iptables status
```

6. Save the updated file to `/etc/sysconfig/iptables`.

```
[root@dbsys ~]# /sbin/service iptables save
```

The change takes effect immediately and will remain in effect when the node is rebooted.

7. Update the DB system's security list as described in Updating the Security List for the DB System.

Updating the Security List for the DB System

Review the list of ports in Opening Ports on the DB System and for every port you open in iptables, update the security list used for the DB system, or create a new security list.

Note that port 1521 for the Oracle default listener is included in iptables, but should also be added to the security list.

To update an existing security list

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Locate the DB system in the list.
4. Note the DB system's **Subnet** name and click its **Virtual Cloud Network**.
5. Locate the subnet in the list, and then click its security list under **Security Lists**.
6. Click **Edit All Rules** and add an ingress rule with source type = CIDR, source CIDR=*<source CIDR>*, protocol=TCP, and port=*<port number or port range>*.
   The source CIDR should be the CIDR block that includes the ports you open for the client connection.

For detailed information about creating or updating a security list, see Security Lists.

Backing Up a Database

Backing up your DB System is a key aspect of any Oracle database environment. You can store backups in the cloud or in local storage. Each backup destination has advantages, disadvantages, and requirements that you should consider, as described below.

Object Storage (Recommended)

- Backups are stored in the Oracle Cloud Infrastructure Object Storage.
- Durability: High

- Availability: High
- Back Up and Recovery Rate: Medium
- Advantages: High durability, performance, and availability.

Local Storage

- Backups are stored locally in the Fast Recovery Area of the DB System.
- Durability: Low
- Availability: Medium
- Back Up and Recovery Rate: High
- Advantages: Optimized back up and fast point-in-time recovery.
- Disadvantages: If the DB System becomes unavailable, the backup is also unavailable.

Currently, Oracle Cloud Infrastructure does not provide the ability to attach block storage volumes to a DB System, so you cannot back up to network attached volumes.

For 1- and 2-node RAC DB Systems, see:

- Backing Up to Oracle Cloud Infrastructure Object Storage
- Backing Up to Local Storage Using the Database CLI

Backing Up to Oracle Cloud Infrastructure Object Storage

Note

This topic is not applicable to Exadata DB systems. For Exadata DB systems, see Backing Up an Exadata Database.

This topic explains how to work with backups managed by Oracle Cloud Infrastructure. You do this by using the Console or the API. (For unmanaged backups, you can use `RMAN` or `dbcli`,

and you must create and manage your own Object Storage buckets for backups. See Backing Up to Object Storage Using RMAN.)

Warning

If you previously used `RMAN` or `dbcli` to configure backups and then you switch to using the Console or the API for backups, a new backup configuration is created and associated with your database. This means that you can no longer rely on your previously configured unmanaged backups to work.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies.

Prerequisites

The DB system requires access to the Oracle Cloud Infrastructure Object Storage service, including connectivity to the applicable Swift endpoint for Object Storage. Oracle recommends using a service gateway with the VCN to enable this access. For more information, see these topics:

- Network Setup for DB Systems: For information about setting up your VCN for the DB system, including the service gateway.
- https://cloud.oracle.com/infrastructure/storage/object-storage/faq: For information about the Swift endpoints to use.

Important

In addition to the prerequisites listed, ensure that the following conditions are met to avoid backup failures:

- The database's archiving mode is set to `ARCHIVELOG` (the default).
- The `/u01` directory on the database host file system has sufficient free space for the execution of backup processes.
- The .bash_profile file for the oracle user does not include any interactive commands (such as `oraenv` or one that could generate an error or warning message).
- (For automatic backups) No changes were made to the default `WALLET_LOCATION` entry in the sqlnet.ora file.
- No changes were made to `RMAN` backup settings by using standard `RMAN` commands.

See Backup Failures for details on problems that can result from not following these guidelines.

USING THE CONSOLE

You can use the Console to enable automatic incremental backups, create full backups on demand, and view the list of managed backups for a database. The Console also allows you to delete full backups.

Note

The list of backups you see in the Console does not include any unmanaged backups (backups created directly by using `RMAN` or `dbcli`).

All backups are encrypted with the same master key used for Transparent Data Encryption (TDE) wallet encryption.

The database and DB system must be in an "Available" state for a backup operation to run successfully. Oracle recommends that you avoid performing actions that could interfere with availability (such as patching and Data Guard operations) while a backup operation is in progress. If an automatic backup operation fails, the Database service retries the operation during the next day's backup window. If an on-demand full backup fails, you can try the operation again when the DB system and database availability are restored.

Automatic Incremental Backups

When you enable the Automatic Backup feature, the service creates daily incremental backups of the database to Object Storage. The first backup created is a level 0 backup. Then, level 1 backups are created every day until the next weekend. Every weekend, the cycle repeats, starting with a new level 0 backup. The automatic backup process can run at any time within the daily backup window (between midnight and 6:00 AM in the time zone of the DB system's region). See note for backup window time zone information. If you choose to enable automatic backups, you can choose one of the following preset retention periods: 7 days, 15 days, 30 days, 45 days, or 60 days. The system automatically deletes your incremental backups at the end of your chosen retention period.

Note

- **Backup Window Time Zone** - Automatic backups enabled for the first time after November 20, 2018 on any database will run between midnight and 6:00 AM in the time zone of the DB system's region. If you have enabled automatic backups on a database before this date, the backup window for the database will continue to be between midnight and 6:00 AM **UTC**. You can create a My Oracle Support service request to have your automatic backups run in a backup window of your choice.
- **Data Guard** - You can enable the Automatic Backup feature on a database with the standby role in a Data Guard association. However, automatic backups for that database will not be created until it assumes the primary role.
- **Retention Period Changes** - If you shorten your database's automatic backup retention period in the future, existing backups falling outside the updated retention period are deleted by the system.
- **Object Storage Costs** - Automatic backups incur Object Storage usage costs.

On-Demand Full Backups

You can create a full backup of your database at any time unless your database is assuming the standby role in a Data Guard association.

Standalone Backups

When you terminate a DB system or a database, all of its resources are deleted, along with any automatic backups. Full backups remain in Object Storage as standalone backups. You can use a standalone backup to create a new database.

To navigate to the list of standalone backups for your current compartment

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Click **Standalone Backups** under **Bare Metal, VM, and Exadata**.

To configure automatic backups for a database

When you launch a DB system, you can optionally enable automatic backups for the initial database. Use this procedure to configure or disable automatic backups after the database is created.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Find the DB system where the database is located, and click the system name to display details about it.
   A list of databases is displayed.
4. Find the database for which you want to enable or disable automatic backups, and click its name to display database details. The details indicate whether automatic backups are enabled. When backups are enabled, the details also indicate the chosen backup retention period .
5. Click **Configure Automatic Backups**.
6. In the **Configure Automatic Backups** dialog, check or uncheck **Enable Automatic Backup**, as applicable. If you are enabling automatic backups, you can choose one of

the following preset retention periods: 7 days, 15 days, 30 days, 45 days, or 60 days. The default selection is 30 days.

7. Click **Save Changes**.

To create an on-demand full backup of a database

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Find the DB system where the database is located, and click the system name to display details about it.
   A list of databases is displayed.
4. Find the database for which you want to create an on-demand full backup and click its name to display database details.
5. Under **Resources**, click **Backups**.
   A list of backups is displayed.
6. Click **Create Backup**.

To delete full backups from Object Storage

Note

You cannot explicitly delete automatic backups. Unless you terminate the database, automatic backups remain in Object Storage for 30 days, after which time they are automatically deleted.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Find the DB system where the database is located and click the DB system name to display details.
   A list of databases is displayed.
4. Find the database you are interested in and click its name to display database details.
5. Under **Resources**, click **Backups**.
   A list of backups is displayed.
6. Click the Actions icon (three dots) for the backup you are interested in, and then click **Delete**.
7. Confirm when prompted.

USING THE API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage database backups:

- ListBackups
- GetBackup
- CreateBackup
- DeleteBackup
- UpdateDatabase - To enable and disable automatic backups.

For the complete list of APIs for the Database service, see Database Service API.

WHAT'S NEXT?

See Recovering a Database from Object Storage.

Backing Up to Local Storage Using the Database CLI

Note

This topic is not applicable to virtual machine DB systems because they have no local storage. For Exadata DB systems, see Backing Up an Exadata Database.

This topic explains how to back up to the local Fast Recovery Area on a bare metal DB system by using the database CLI (dbcli). Some sample dbcli commands are provided below. For complete command syntax, see the Oracle Database CLI Reference.

Note

Backing up to local storage is fast and provides for fast point-in-time recovery, however, if the DB system becomes unavailable, the backup also becomes unavailable. For information about more durable backup destinations, see Backing Up a Database.

Backing Up the Database to Local Storage

You'll use the dbcli commands to create a backup configuration, associate the backup configuration with the database, initiate the backup operation, and then review the backup job.

1. SSH to the DB System.

   ```
   ssh -i <private_key_path> opc@<db_system_ip_address>
   ```

2. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the root user's profile, which will set the PATH to the dbcli directory (`/opt/oracle/dcs/bin`).

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. Create a backup configuration by using the dbcli update-backupconfig command and specify local disk storage as the backup destination.

   The following example creates a backup configuration named prodbackup and specifies a disk backup destination and a disk recovery window of 5 (backups and archived redo logs will be maintained in local storage for 5 days).

```
[root@dbsys ~]# dbcli create-backupconfig --name prodbackup --backupdestination disk  --
recoverywindow 5
{
  "jobId" : "e7050756-0d83-48ce-9336-86592be59827",
  "status" : "Success",
  "message" : null,
  "reports" : [ {
    "taskId" : "TaskParallel_471",
    "taskName" : "persisting backup config metadata",
    "taskResult" : "Success",
    "startTime" : 1467774813141,
    "endTime" : 1467774813207,
    "status" : "Success",
    "taskDescription" : null,
    "parentTaskId" : "TaskSequential_467",
    "jobId" : "e7050756-0d83-48ce-9336-86592be59827",
    "reportLevel" : "Info",
    "updatedTime" : 1467774813207
  } ],
  "createTimestamp" : 1467774781851,
  "description" : "create backup config:prodbackup",
  "updatedTime" : 1467774813236
}
```

   The example above uses full parameter names for demonstration purposes, but you can abbreviate the parameters like this:

```
dbcli create-backupconfig -n prodbackup -d disk  -w 5
```

4. Get the ID of the database you want to back up by using the dbcli list-databases command.

```
[root@dbsys ~]# dbcli list-databases

ID                                       DB Name    DB Version CDB        Class    Shape
Storage    Status
---------------------------------------- ---------- ---------- ---------- -------- -------- -----
----- ----------
71ec8335-113a-46e3-b81f-235f4d1b6fde     prod       12.1.0.2   true       OLTP     odb1     ACFS
     Configured
```

5. Get the ID of the backup configuration by using the dbcli list-backupconfigs command.

```
[root@dbbackup backup]# /opt/oracle/dcs/bin/dbcli list-backupconfigs
ID                                       Name                 DiskRecoveryWindow
BackupDestination createTime
---------------------------------------- -------------------- ----- ------ ----------------------
-------------

78a2a5f0-72b1-448f-bd86-cf41b30b64ee     prodbackup           5     Disk   July 6, 2016 3:13:01
AM UTC
```

6. Associate the backup configuration ID with the database ID by using the dbcli update-database command.

```
[root@dbsys ~]# dbcli update-database  --backupconfigid 78a2a5f0-72b1-448f-bd86-cf41b30b64ee --
dbid 71ec8335-113a-46e3-b81f-235f4d1b6fde
{
  "jobId" : "2b104028-a0a4-4855-b32a-b97a37f5f9c5",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : 1467775842977,
  "description" : "update database id:71ec8335-113a-46e3-b81f-235f4d1b6fde",
  "updatedTime" : 1467775842978
}
```

   You can view details about the update job by using the dbcli describe-job command and specifying the job ID from the `dbcli update-database` command output, for example:

```
dbcli describe-job --jobid 2b104028-a0a4-4855-b32a-b97a37f5f9c5
```

7. Initiate the database backup by using the dbcli create-backup command. The backup operation is performed immediately.

The following example creates a backup of the specified database.

```
[root@dbsys ~]# dbcli create-backup --dbid 71ec8335-113a-46e3-b81f-235f4d1b6fde
{
    "createTimestamp": 1467792576854,
    "description": "Backup service creation with db name: prod",
    "jobId": "d6c9edaa-fc80-40a9-bcdd-056430cdc56c",
    "message": null,
    "reports": [],
    "status": "Created",
    "updatedTime": 1467792576855
}
```

Or you can abbreviate the command parameters like this:

```
dbcli create-backup -i 71ec8335-113a-46e3-b81f-235f4d1b6fde
```

You can view details about the back up job by using the dbcli describe-job command and specifying the job ID from the `dbcli create-backup` command output, for example:

```
dbcli describe-job --jobid d6c9edaa-fc80-40a9-bcdd-056430cdc56c
```

8. **Important!** Manually back up any TDE password-based wallets to your choice of a safe location, preferably not on the DB system. The wallets are required to restore the backup to a new host.
9. Optionally, you can review the backup report. Use the Oracle Database CLI Reference command to create a report, then use Oracle Database CLI Reference to get the report ID, and then use Oracle Database CLI Reference with the report ID to get the report location, as shown in the following example.

```
[root@dbsys ~]# dbcli create-backupreport --dbid 71ec8335-113a-46e3-b81f-235f4d1b6fde --
reporttype summary

{
       "jobId" : "65ce79fe-4ef4-4d7d-8020-e56a5390026d",
       "status" : "Created",
       "message" : null,
       "reports" : [ ],
       "createTimestamp" : "July 6, 2016 23:06:11 PM UTC",
       "description" : "Creating a report for database 71ec8335-113a-46e3-b81f-235f4d1b6fde",
       "updatedTime" : "July 6, 2016 23:06:11 PM UTC"
```

```
}

[root@dbsys ~]# dbcli list-backupreports

ID                                       Name                 ReportType DbId
                createTime                          updatedTime
---------------------------------------- -------------------- ---------- ------------------------
---------------- ---------------------------------- ----------------------------------
c0e0a16a-485f-4176-ab73-5b30ccf5c560                          summary    71ec8335-113a-46e3-b81f-
235f4d1b6fde     July 6, 2016 11:04:05 PM UTC        July 6, 2016 11:04:17 PM UTC

[root@dbsys ~]# dbcli describe-backupreport --id c0e0a16a-485f-4176-ab73-5b30ccf5c560

Backup Report details
----------------------------------------------------------------
                     ID: ed67a2cf-fe63-4755-a5d6-7eda5b669837
                   Name:
            Report Type: summary
               Location:
/opt/oracle/dcs/log/LrbvevghazqOGpbatvbpMRZJeVCzaW/rman/bkup/hhUiFnBz/rman_list_backup_
summary/2016-07-06/rman_list_backup_summary_2016-07-06_09-49-20.0832.log
            Database ID: 71ec8335-113a-46e3-b81f-235f4d1b6fde
            CreatedTime: July 6, 2016 3:49:12 AM UTC
            UpdatedTime: July 6, 2016 3:49:24 AM UTC
```

After the backup command completes, the database backup files are available in the Fast Recovery Area on the DB system.

WHAT'S NEXT?

See Recovering a Database from a CLI Backup.

Recovering a Database

For information on restoring a database on a bare metal or virtual machine DB system, see the following topics:

- Recovering a Database from Object Storage
- Recovering a Database from a CLI Backup

- Recovering a Database from the Oracle Cloud Infrastructure Classic Object Store

Recovering a Database from Object Storage

Note

This topic is not applicable to Exadata DB systems.

This topic explains how to recover a database from a backup stored in Object Storage. The service is a secure, scalable, on-demand storage solution in Oracle Cloud Infrastructure. For information on using Object Storage as a backup destination, see Backing Up to Oracle Cloud Infrastructure Object Storage.

You can recover a database using the Console, API, or by using RMAN.

Warning

Avoid entering confidential information when assigning descriptions, tags, or friendly names to your cloud resources through the Oracle Cloud Infrastructure Console, API, or CLI.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies.

PREREQUISITES

The DB system requires access to the Oracle Cloud Infrastructure Object Storage service, including connectivity to the applicable Swift endpoint for Object Storage. Oracle recommends using a service gateway with the VCN to enable this access. For more information, see these topics:

- Network Setup for DB Systems: For information about setting up your VCN for the DB system, including the service gateway.
- https://cloud.oracle.com/infrastructure/storage/object-storage/faq: For information about the Swift endpoints to use.

USING THE CONSOLE

You can use the Console to restore the database from a backup in the Object Storage that was created by using the Console or the API. You can restore to the last known good state of the database, or you can specify a point in time or an existing System Change Number (SCN). You can also create a new database by using a standalone backup.

Note

The list of backups you see in the Console does not include any unmanaged backups (backups created directly by using `RMAN` or `dbcli`).

Restoring a database with Data Guard enabled is not supported. You must first remove the Data Guard association by terminating the standby database before you can restore the database.

RESTORING AN EXISTING DATABASE

To restore a database

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.

2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Find the DB system where the database is located, and click the system name to display details about it.
   A list of databases is displayed.
4. Find the database you want to restore, and click its name to display details about it.
   A list of backups is displayed in the default view of the database details. You can also access the list of backups for a database by clicking on **Backups** under **Resources**.
5. Click the Actions icon (three dots) for the backup you are interested in, and then click **Restore**.
6. Select one of the following options, and click **Restore Database**:
   - **Restore to the latest:** Restores the database to the last known good state with the least possible data loss.
   - **Restore to the timestamp:** Restores the database to the timestamp specified.
   - **Restore to SCN:** Restores the database using the SCN specified. This SCN must be valid.

   Tip

   You can determine the SCN number to use either by accessing and querying your database host, or by accessing any online or archived logs.
7. Confirm when prompted.
   If the restore operation fails, the database will be in a "Restore Failed" state. You can try restoring again using a different restore option. However, Oracle recommends that you review the `RMAN` logs on the host and fix any issues before reattempting to restore the database.

To restore a database using a specific backup from Object Storage

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose your **Compartment**.
   A list of DB systems is displayed.
3. Find the DB system where the database is located, and click the system name to display details about it.
   A list of databases is displayed.
4. Find the database you want to restore, and click its name to display details about it.
5. Under **Resources**, click **Backups**.
   A list of backups is displayed.
6. Click the Actions icon (three dots) for the backup you are interested in, and then click **Restore**.
7. Confirm when prompted.

Creating a New Database from a Backup

You can use a backup to create a database in an existing DB system or to launch a new DB system. See the following procedures for more information:

- To create a database from a backup in an existing DB system
- To launch a new DB system from a backup

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to recover a database:

- ListBackups
- GetBackup

- RestoreDatabase
- CreateDbHome - For creating a DB system database from a standalone backup.

For the complete list of APIs for the Database service, see Database Service API.

Using an RMAN Backup

This topic explains how to recover a Recovery Manager (RMAN) backup stored in Object Storage.

Prerequisites

You'll need the following:

- A new DB system to restore the database to (see assumptions below). For more information, see Managing Bare Metal and Virtual Machine DB Systems.
- The Oracle Database Cloud Backup Module must be installed on the DB system. For more information, see Installing the Backup Module on the DB System.

Assumptions

The procedures below assume the following:

- A new DB system has been created to host the restored database and no other database exists on the new DB system. It is possible to restore to a DB system that has existing databases, but that is beyond the scope of this topic.
- The original database is lost and all that remains is the latest RMAN backup. For virtual machine DB systems, the procedure assumes the DB system (inclusive of the database) no longer exists.

Warning

Any data not included in the most recent backup will be lost.

- The Oracle Wallet and/or encryption keys used by the original database at the time of the last backup is available.
- The RMAN backup contains a copy of the control file and spfile as of the most recent backup as well as all of the datafile and archivelog backups needed to perform a complete database recovery.
- An RMAN catalog will not be used during the restore.

SETTING UP STORAGE ON THE DB SYSTEM

1. SSH to the DB System.

   ```
   ssh -i <private_key_path> opc@<db_system_ip_address>
   ```

2. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the root user's profile, which will set the PATH to the dbcli directory (`/opt/oracle/dcs/bin`).

   ```
   login as: opc

   [opc@dbsys ~]$ sudo su -
   ```

3. You can use an existing empty database home or create a new one for the restore. Use the applicable commands to help you complete this step.

   If you will be using an existing database home:

   - Use the dbcli list-dbhomes command to list the database homes.

     ```
     [root@dbsys ~]# dbcli list-dbhomes
     ID                                       Name                 DB Version Home Location
     ---------------------------------------- -------------------- ---------- -----------------
     ----------------------------
     2e743050-b41d-4283-988f-f33d7b082bda     OraDB12102_home1     12.1.0.2
     /u01/app/oracle/product/12.1.0.2/dbhome_1
     ```

   - Use the dbcli list-databases command to ensure the database home is not associated with any database.

   If necessary, use the dbcli create-dbhome command to create a database home for the restore.

4. Use the dbcli create-dbstorage to set up directories for DATA, RECO, and REDO storage. The following example creates 10GB of ACFS storage for the rectest database.

```
[root@dbsys ~]# dbcli create-dbstorage --dbname rectest --dataSize 10 --dbstorage ACFS
```

Note

When restoring a version 11.2 database, ACFS storage must be specified.

PERFORMING THE DATABASE RESTORE AND RECOVERY

1. SSH to the DB system, log in as opc, and then become the oracle user.

```
sudo su - oracle
```

2. Create an entry in `/etc/oratab` for the database. Use the same SID as the original database.

```
db1:/u01/app/oracle/product/12.1.0.2/dbhome_1:N
```

3. Set the ORACLE_HOME and ORACLE_SID environment variables using the oraenv utility.

```
. oraenv
```

4. Obtain the DBID of the original database. This can be obtained from the file name of the `controlfile` autobackup on the backup media. The file name will include a string that contains the DBID. The typical format of the string is `c-DDDDDDDDDDDD-YYYYMMDD-NN` where `DDDDDDDDDDDD` is the DBID, `YYYYMMDD` is the date the backup was created, and `NN` is a sequence number to make the file name unique. The DBID in the following examples is 1508405000. Your DBID will be different.

   Use the following curl syntax to perform a general query of Object Storage. The parameters in red are the same parameters you specified when installing the backup module as described in Installing the Backup Module on the DB System.

```
curl -u '<user_ID>.com:<auth_token>' -v https://swiftobjectstorage.<region_
name>.oraclecloud.com/v1/<tenant_name>
```

See Regions and Availability Domains to look up the region name.
For example:

```
curl -u 'djones@mycompany.com:1cnk!d0++ptETd&C;tHR' -v https://swiftobjectstorage.<region_name>.oraclecloud.com/v1/mycompany
```

To get the DBID from the control file name, use the following syntax:

```
curl -u '<user_id>.com:<auth_token>' -v https://swiftobjectstorage.<region_name>.oraclecloud.com/v1/<tenant_name>/<bucket_name>?prefix=sbt_catalog/c-
```

For example:

```
curl -u 'djones@mycompany.com:1cnk!d0++ptETd&C;tHR' -v https://swiftobjectstorage.<region_name>.oraclecloud.com/v1/mycompany/dbbackups/?prefix=sbt_catalog/c-
```

In the sample output below, 1508405000 is the DBID.

```
{
    "bytes": 1732,
    "content_type": "binary/octet-stream",
    "hash": "f1b61f08892734ed7af4f1ddaabae317",
    "last_modified": "2016-08-11T20:28:34.438000",
    "name": "sbt_catalog/c-1508405000-20160811-00/metadata.xml"
}
```

5. Run RMAN and connect to the target database. There is no need to create a `pfile` or `spfile` or use a backup `controlfile`. These will be restored in the following steps. Note that the target database is `(not started)`. This is normal and expected at this point.

```
rman target /

Recovery Manager: Release 12.1.0.2.0 - Production on Wed Jun 22 18:36:40 2016

Copyright (c) 1982, 2014, Oracle and/or its affiliates.  All rights reserved.

connected to target database (not started)
```

6. Set the DBID using the value obtained above.

```
RMAN> set dbid 1508405000;

executing command: SET DBID
```

7. Run the `STARTUP NOMOUNT` command. If the server parameter file is not available, RMAN attempts to start the instance with a dummy server parameter file. The ORA-01078 and LRM-00109 errors are normal and can be ignored.

```
RMAN> STARTUP NOMOUNT

startup failed: ORA-01078: failure in processing system parameters
LRM-00109: could not open parameter file '/u01/app/oracle/product/12.1.0.2/dbhome_
1/dbs/initdb1.ora'

starting Oracle instance without parameter file for retrieval of spfile
Oracle instance started

Total System Global Area    2147483648 bytes

Fixed Size                     2944952 bytes
Variable Size                847249480 bytes
Database Buffers            1254096896 bytes
Redo Buffers                  43192320 bytes
```

8. Restore the server parameter file from autobackup.
   The SBT_LIBRARY is the same library specified with the `-libDir` parameter when the Backup Module was installed, for example `/home/oracle/lib/`.
   The OPC_PFILE is the same file specified with the `-configfile` parameter when the Backup Module was installed, for example `/home/oracle/config`.

```
set controlfile autobackup format for device type sbt to '%F';
run {
  allocate channel c1 device type sbt PARMS  'SBT_LIBRARY=/home/oracle/lib/libopc.so, SBT_PARMS=
(OPC_PFILE=/home/oracle/config)';
  restore spfile from autobackup;
}
```

9. Create the directory for audit_file_dest. The default is `/u01/app/oracle/admin/$ORACLE_SID/adump`. You can see the setting used by the original database by searching the spfile for the string, `audit_file_dest`.

```
strings ${ORACLE_HOME}/dbs/spfile${ORACLE_SID}.ora | grep audit_file_dest
*.audit_file_dest='/u01/app/oracle/admin/db1/adump'

mkdir -p /u01/app/oracle/admin/db1/adump
```

10. If block change tracking was enabled on the original database, create the directory for the block change tracking file. This will be a directory under `db_create_file_dest`. Search the `spfile` for the name of the directory.

```
strings ${ORACLE_HOME}/dbs/spfile${ORACLE_SID}.ora | grep db_create_file_dest
*.db_create_file_dest='/u02/app/oracle/oradata/db1'

mkdir -p /u02/app/oracle/oradata/db1/<$ORA_UNQNAME if available or database name>/changetracking
```

11. Restart the instance with the restored server parameter file.

```
STARTUP FORCE NOMOUNT;
```

12. Restore the controlfile from the RMAN autobackup and mount the database.

```
set controlfile autobackup format for device type sbt to '%F';
run {
  allocate channel c1 device type sbt PARMS 'SBT_LIBRARY=/home/oracle/lib/libopc.so, SBT_PARMS=
(OPC_PFILE=/home/oracle/config)';
  restore controlfile from autobackup;
  alter database mount;
    }
```

13. Restore and recover the database.

```
RESTORE DATABASE;
RECOVER DATABASE;
```

14. RMAN will recover using archived redo logs until it can't find any more. It is normal for an error similar to the one below to occur when RMAN has applied the last archived redo log in the backup and can't find any more logs.

```
unable to find archived log
archived log thread=1 sequence=29
RMAN-00571: ===========================================================
RMAN-00569: =============== ERROR MESSAGE STACK FOLLOWS ===============
RMAN-00571: ===========================================================
RMAN-03002: failure of recover command at 06/28/2016 00:57:35
```

```
RMAN-06054: media recovery requesting unknown archived log for thread 1 with sequence 29 and
starting SCN of 2349563
```

15. Open the database with resetlogs.

```
ALTER DATABASE OPEN RESETLOGS;
```

The recovery is complete. The database will have all of the committed transactions as of the last backed up archived redo log.

Recovering a Database from a CLI Backup

Note

This topic is not applicable to Exadata DB Systems.

This topic explains how to perform a complete or point-in-time recovery of an existing database from a backup created with the dbcli create-backup command. The backup resides in the local Fast Recovery Area on the DB System.

To initiate the recovery, you'll use the Oracle Database CLI Reference command and specify the recovery type parameter (either `--recoverytype` or just `-t`). You can specify the following types of recovery:

- `-t Latest` for a complete recovery
- `-t SCN -s <scn>` for a recovery using a system change number (SCN) as the end point of the recovery
- `-t PITR <mm/dd/yyyy hh:mm:ss>` for a database point-in-time (incomplete) recovery based on a time stamp

The `dbcli create-recovery` attempts to perform a full recovery of the database. For information on performing a partial recovery (datafile, tablespace and PDB), see the *Oracle Database Backup Recovery Guide* for version 18.1, 12.2, 12.1, or 11.2.

PREREQUISITES

- The backup must have been created with the `dbcli create-backup` command.
- If the database is configured with Transparent Data Encryption (TDE), make sure the password-based and autologin TDE wallets are present in the following location:

```
/opt/oracle/dcs/commonstore/wallets/tde/<db_unique_name>
```

RECOVERING THE DATABASE

1. SSH to the DB System.

```
ssh -i <private_key_path> opc@<db_system_ip_address>
```

2. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the root user's profile, which will set the PATH to the dbcli directory (`/opt/oracle/dcs/bin`).

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. Find the ID of database you want to recover by using the dbcli list-databases command. You'll need the ID for the following step.

```
[root@dbsys ~]# dbcli list-databases
ID                                       DB Name    DB Version CDB        Class    Shape
Storage    Status
---------------------------------------- ---------- ---------- ---------- -------- -------- -----
----- ----------
5a3e980b-e0fe-4909-9628-fcefe43b3326     prod       12.1.0.2   true       OLTP     odb1     ACFS
     Configured
```

4. Initiate the recovery by using the Oracle Database CLI Reference command and specifying the database ID, recovery type parameter (`-t`), and any parameter required for the recover type, like the time stamp or system change number.
   The following example initiates a complete recovery.

```
[root@dbsys ~]# dbcli create-recovery --dbid 5a3e980b-e0fe-4909-9628-fcefe43b3326 --recoverytype
Latest
{
```

```
  "jobId" : "c9f81228-2ce9-43b4-88f6-b260d398cf06",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "August 08, 2016 18:20:47 PM UTC",
  "description" : "Create recovery for database id :5a3e980b-e0fe-4909-9628-fcefe43b3326",
  "updatedTime" : "August 08, 2016 18:20:47 PM UTC"
}
```

The following example initiates a point-in-time recovery of the specified database:

```
[root@dbsys ~]# dbcli create-recovery --dbid d4733796-dbea-4155-8606-24a85d64bd74 --recoverytype
PITR --recoveryTimeStamp 08/09/2016 5:12:15
```

Note the job ID in the command output.

5. Check the status of the recovery by using the dbcli describe-job command with the job ID from the previous step.

```
[root@dbsys ~]# dbcli describe-job -i c9f81228-2ce9-43b4-88f6-b260d398cf06

Job details
----------------------------------------------------------------
                     ID:  c9f81228-2ce9-43b4-88f6-b260d398cf06
            Description:  Create recovery for database id :5a3e980b-e0fe-4909-9628-fcefe43b3326
                 Status:  Success
                Created:  August 8, 2016 6:20:47 PM UTC
                Message:

Open database                            August 8, 2016 6:22:35 PM UTC       August 8, 2016
6:22:44 PM UTC       Success
Restart database                         August 8, 2016 6:22:44 PM UTC       August 8, 2016
```

```
6:23:41 PM UTC       Success
Persist Recovery Metadata               August 8, 2016 6:23:41 PM UTC       August 8, 2016
6:23:41 PM UTC       Success
```

You can also check the database restore report logs on the DB System at:

```
/opt/oracle/dcs/log/<nodename>/rman/bkup/<db_unique_name>
```

Recovering a Database from the Oracle Cloud Infrastructure Classic Object Store

Note

This topic is not applicable to Exadata DB systems.

This topic explains how to recover a database using a backup created by the Oracle Database Backup Module and stored in Oracle Cloud Infrastructure Object Storage Classic.

The following terms are used throughout this topic:

- Source database: The database backup in Object Storage Classic.
- Target database: The new database on a DB system in Oracle Cloud Infrastructure.

PREREQUISITES

You'll need the following:

- The service name, identity name, container, user name, and password for Oracle Cloud Infrastructure Object Storage Classic.
- The backup password if password-based encryption was used when backing up to Object Storage Classic.
- The source database ID, database name, database unique name (required for setting up storage).
- If the source database is configured with Transparent Data Encryption (TDE), you'll need a backup of the wallet and the wallet password.
- Tnsnames to setup for any database links.

- The output of `Opatch lsinventory` for the source database Oracle_home, for reference.
- A copy of the sqlpatch directory from the source database home. This is required for rollback in case the target database does not include these patches.

Setting Up Storage on the DB System

1. SSH to the DB System.

```
ssh -i <private_key_path> opc@<db_system_ip_address>
```

2. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the root user's profile, which will set the PATH to the dbcli directory (`/opt/oracle/dcs/bin`).

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. Use the dbcli create-dbstorage to set up directories for DATA, RECO, and REDO storage. The following example creates 10GB of ACFS storage for the tdetest database.

```
[root@dbsys ~]# dbcli create-dbstorage --dbname tdetest --dataSize 10 --dbstorage ACFS
```

Note

When migrating a version 11.2 database, ACFS storage must be specified.

4. Use the dbcli list-dbstorages command to list the storage ID. You'll need the ID for the next step.

```
[root@dbsys ~]# dbcli list-dbstorages
ID                                       Type   DBUnique Name        Status
---------------------------------------- ------ -------------------- ----------
9dcdfb8e-e589-4d5f-861a-e5ba981616ed     Acfs   tdetest              Configured
```

5. Use the dbcli describe-dbstorage command with the storage ID from the previous step to list the DATA, RECO and REDO locations.

```
[root@dbsys ~]# dbcli describe-dbstorage --id 9dcdfb8e-e589-4d5f-861a-e5ba981616ed
DBStorage details
----------------------------------------------------------------
                     ID: 9dcdfb8e-e589-4d5f-861a-e5ba981616ed
                DB Name: tdetest
          DBUnique Name: tdetest
         DB Resource ID:
           Storage Type: Acfs
          DATA Location: /u02/app/oracle/oradata/tdetest
          RECO Location: /u03/app/oracle/fast_recovery_area/
          REDO Location: /u03/app/oracle/redo/
                  State: ResourceState(status=Configured)
                Created: August 24, 2016 5:25:38 PM UTC
            UpdatedTime: August 24, 2016 5:25:53 PM UTC
```

6. Note the DATA, RECO and REDO locations. You'll need them later to set the `db_create_file_dest`, `db_create_online_log_dest`, and `db_recovery_file_dest` parameters for the database.

CHOOSING AN ORACLE_HOME

Decide which ORACLE_HOME to use for the database restore and then switch to that home with the correct ORACLE_BASE, ORACLE_HOME, and PATH settings. The ORACLE_HOME must not already be associated with a database.

To get a list of existing ORACLE_HOMEs and to ensure that the ORACLE_HOME is empty, use the dbcli list-dbhomes and the dbcli list-databases commands, respectively. To create a new ORACLE_HOME, use the dbcli create-dbhome command.

COPYING THE SOURCE DATABASE WALLETS

Skip this section if the source database is **not** configured with TDE.

1. On the DB system, become the oracle user:

```
sudo su - oracle
```

2. Create the following directory, if it does not already exist:

```
mkdir /opt/oracle/dcs/commonstore/wallets/tde/<db_unique_name>
```

3. Copy the ewallet.p12 file from the source database to the directory you created in the previous step.
4. On the target host, make sure that `$ORACLE_HOME/network/admin/sqlnet.ora` contains the following line:

```
ENCRYPTION_WALLET_LOCATION=(SOURCE=(METHOD=FILE)(METHOD_DATA=
(DIRECTORY=/opt/oracle/dcs/commonstore/wallets/tde/$ORACLE_UNQNAME)))
```

   Add the line if it doesn't exist in the file. (The line might not be there if this is a new home and no database has been created yet on this host.)
5. Create the autologin wallet from the password-based wallet to allow auto-open of the wallet during restore and recovery operations.

   For a version 12.1 or later database, use the `ADMINISTER KEY MANAGEMENT` command:

```
$cat create_autologin_12.sh

#!/bin/sh
if [ $# -lt 2 ]; then
        echo "Usage: $0 <dbuniquename><remotewalletlocation>"
        exit 1;
fi

mkdir /opt/oracle/dcs/commonstore/wallets/tde/$1
cp $2/ewallet.p12* /opt/oracle/dcs/commonstore/wallets/tde/$1
rm -f autokey.ora
echo "db_name=$1"  > autokey.ora
autokeystoreLog="autologinKeystore_`date +%Y%m%d_%H%M%S_%N`.log"
echo "Enter Keystore Password:"
read -s keystorePassword
echo "Creating AutoLoginKeystore -> "
sqlplus "/as sysdba"  <<EOF
spool $autokeystoreLog
set echo on
startup nomount pfile=autokey.ora
ADMINISTER KEY MANAGEMENT CREATE AUTO_LOGIN KEYSTORE
FROM KEYSTORE '/opt/oracle/dcs/commonstore/wallets/tde/$1' -- Keystore location
IDENTIFIED BY "$keystorePassword";
shutdown immediate;
EOF
```

Adjust the `cwallet.sso` permissions from `oracle:asmadmin` to `oracle:oinstall`.

```
$ ls -ltr /opt/oracle/dcs/commonstore/wallets/tde/<db_unique_name>

total 20

-rw-r--r-- 1 oracle oinstall 5680 Jul  6 11:39 ewallet.p12

-rw-r--r-- 1 oracle asmadmin 5725 Jul  6 11:39 cwallet.sso
```

For a version 11.2 database, use the `orapki` command:

```
orapki wallet create -wallet wallet_location -auto_login [-pwd password]
```

INSTALLING THE ORACLE DATABASE BACKUP MODULE

The backup module JAR file is included on the DB system but you need to install it.

1. SSH to the DB system, log in as opc, and then become the oracle user.

   ```
   ssh -i <path to SSH key used when launching the DB System> opc@<DB System IP address or hostname>

   sudo su - oracle
   ```

2. Change to the directory that contains the backup module `opc_install.jar` file.

   ```
   cd /opt/oracle/oak/pkgrepos/orapkgs/oss/<version>/
   ```

3. Use the command syntax described in Installing the Oracle Database Cloud Backup Module to install the backup module.

SETTING ENVIRONMENT VARIABLES

Set the following environment variables for the RMAN and SQL*Plus sessions for the database:

```
ORACLE_HOME=<path of Oracle Home where the database is to be restored>
ORACLE_SID=<database instance name>
ORACLE_UNQNAME=<db_unique_name in lower case>
NLS_DATE_FORMAT="mm/dd/yyyy hh24:mi:ss"
```

ALLOCATING AN RMAN SBT CHANNEL

For each restore operation, allocate an SBT channel and set the SBT_LIBRARY parameter to the location of the `libopc.so` file and the OPC_FILE parameter to the location of the `opc_`

sbt.ora file, for example:

```
ALLOCATE CHANNEL c1 DEVICE TYPE sbt MAXPIECESIZE 2 G FORMAT '%d_%I_%U' PARMS 'SBT_
LIBRARY=/tmp/oss/libopc.so ENV=(OPC_PFILE=/<ORACLE_HOME>/dbs/opc_sbt.ora)';
```

(For more information about these files, see Files Created When the Backup Module is Installed.)

Ensuring Decryption is Turned On

Make sure that decryption is turned on for all the RMAN restore sessions.

```
set decryption wallet open identified by <keystore password>;
```

For more information, see Providing Password Required to Decrypt Encrypted Backups.

Restoring Spfile

The following sample shell script restores the spfile. Set the $dbID variable to the dbid of the database being restored. By default, spfile is restored to $ORACLE_HOME/dbs/spfile<sid>.ora.

```
rman target / <<EOF

spool log to "`date +%Y%m%d_%H%M%S_%N`_dbid_${dbID}_restore_spfile.log"
startup nomount
set echo on
run {
ALLOCATE CHANNEL c1 DEVICE TYPE sbt MAXPIECESIZE 2 G FORMAT '%d_%I_%U' PARMS 'SBT_
LIBRARY=/tmp/oss/libopc.so ENV=(OPC_PFILE=/tmp/oss/opc_sbt.ora)';
SET DBID=$dbID;
RESTORE SPFILE FROM AUTOBACKUP;
shutdown immediate;
EOF
```

Setting the Database Parameters

1. Start the database in nomount mode.

   ```
   startup nomount
   ```

2. Update spfile and modify the following parameters.

- If the database storage type is ACFS, use the DATA, RECO, and REDO locations obtained from the `dbcli describe-dbstorage` command output, as described in Setting Up Storage on the DB System:

```
alter system set db_create_file_dest='/u02/app/oracle/oradata/' scope = spfile;
alter system set db_create_online_log_dest_1='/u03/app/oracle/redo' scope = spfile;
alter system set db_recovery_file_dest='/u03/app/oracle/fast_recovery_area' scope =
spfile;
```

- If the database storage type is ASM:

```
alter system set db_create_file_dest='+DATA' scope = spfile;
alter system set db_create_online_log_dest_1='+RECO' scope = spfile;
alter system set db_recovery_file_dest='+RECO' scope = spfile;
```

- Set `db_recovery_file_dest_size` is not set or is set incorrectly:

```
alter system set db_recovery_file_dest_size=<sizeG> scope=spfile;
```

- Set `audit_file_dest` to the correct value:

```
alter system set audit_file_dest=/u01/app/oracle/admin/<db_unique_name in lower
case>/adump
```

3. Remove the `control_files` parameter. The Oracle Managed Files (OMF) parameters will be used to create the control file.

```
alter system reset control_files scope=spfile;
```

4. Restart the database in nomount mode using the newly added parameters.

```
shutdown immediate
startup nomount
```

RESTORING THE CONTROL FILE

Modify the following sample shell script for your environment to restore the control file. Set the `$dbID` variable to the dbid of the database being restored. Set SBT_LIBRARY to the location specified in the `-libDir` parameter when you installed the Backup Module. Set OPC-PFILE to the location specified in the `-configFile` parameter, which defaults to *ORACLE_HOME*`/dbs/opc`*SID*`.ora`.

```
rman target / <<EOF

spool log to "`date +%Y%m%d_%H%M%S_%N`_dbid_${dbID}_restore_controlfile.log"
```

```
set echo on
run {
ALLOCATE CHANNEL c1 DEVICE TYPE sbt MAXPIECESIZE 2 G FORMAT '%d_%I_%U' PARMS 'SBT_LIBRARY=/<Backup
Module libDir>/libopc.so ENV=(OPC_PFILE=/<Backup Module configFile>/opcSID.ora)';
SET DBID=$dbID;
RESTORE CONTROLFILE FROM AUTOBACKUP;
alter database mount;
}

exit;
EOF
```

RESTORING THE DATABASE

1. Preview and validate the backup. The database is now mounted and RMAN should be able to locate the backup from the restored controlfile. This step helps ensure that the list of archivelogs is present and that the backup components can be restored .
   In the following examples, modify SBT_LIBRARY and OPC_PFILE as needed for your environment.

   ```
   rman target / <<EOF

   spool log to "`date +%Y%m%d_%H%M%S_%N`_restore_database_preview.log"
   set echo on
   run {
   ALLOCATE CHANNEL c1 DEVICE TYPE sbt MAXPIECESIZE 2 G FORMAT '%d_%I_%U' PARMS 'SBT_
   LIBRARY=/tmp/oss/libopc.so ENV=(OPC_PFILE=/tmp/oss/opc_sbt.ora)';
   ALLOCATE CHANNEL c2 DEVICE TYPE sbt MAXPIECESIZE 2 G FORMAT '%d_%I_%U' PARMS 'SBT_
   LIBRARY=/tmp/oss/libopc.so ENV=(OPC_PFILE=/tmp/oss/opc_sbt.ora)';
   ALLOCATE CHANNEL c3 DEVICE TYPE sbt MAXPIECESIZE 2 G FORMAT '%d_%I_%U' PARMS 'SBT_
   LIBRARY=/tmp/oss/libopc.so ENV=(OPC_PFILE=/tmp/oss/opc_sbt.ora)';
   restore database validate header preview;
   }
   ```

   Review the output and if there are error messages, investigate the cause of the problem.
2. Redirect the restore using `set newname` to restore the data files in OMF format and use `switch datafile all` to allow the control file to update with the new data file copies.

```
rman target / <<EOF

spool log to "`date +%Y%m%d_%H%M%S_%N`_restore_database_preview.log"
set echo on
run {
ALLOCATE CHANNEL c1 DEVICE TYPE sbt MAXPIECESIZE 2 G FORMAT '%d_%I_%U' PARMS 'SBT_
LIBRARY=/tmp/oss/libopc.so ENV=(OPC_PFILE=/tmp/oss/opc_sbt.ora)';
ALLOCATE CHANNEL c2 DEVICE TYPE sbt MAXPIECESIZE 2 G FORMAT '%d_%I_%U' PARMS 'SBT_
LIBRARY=/tmp/oss/libopc.so ENV=(OPC_PFILE=/tmp/oss/opc_sbt.ora)';
ALLOCATE CHANNEL c3 DEVICE TYPE sbt MAXPIECESIZE 2 G FORMAT '%d_%I_%U' PARMS 'SBT_
LIBRARY=/tmp/oss/libopc.so ENV=(OPC_PFILE=/tmp/oss/opc_sbt.ora)';
set newname for database to new;
restore database;
switch datafile all;
switch tempfile all;
recover database;
}
```

This recovery will attempt to use the last available archive log backup and then fail with an error, for example:

```
RMAN-00571: ===========================================================
RMAN-00569: =============== ERROR MESSAGE STACK FOLLOWS ===============
RMAN-00571: ===========================================================
RMAN-03002: failure of recover command at 07/20/2016 12:09:02
RMAN-06054: media recovery requesting unknown archived log for thread 1 with sequence 22 and
starting SCN of 878327
```

3. To complete the incomplete recovery, run a recovery using the sequence number and thread number shown in the RMAN-06054 message, for example:

```
Recover database until sequence 22 thread 1;
```

Resetting the Logs

Reset the logs.

```
alter database open resetlogs;
```

Preparing to Register the Database

Before you register the database:

1. Make sure the database COMPATIBLE parameter value is acceptable. If the value is less than the minimum, the database cannot be registered until you upgrade the database compatibility.
   The minimum compatibility values are as follows:
   - For a version 18.1 database - 18.0.0.0
   - For a version 12.2 or 12.1 database - 12.1.0.2
   - For a version 11.2 database - 11.2.0.4
2. Verify that the database has registered with the listener and the service name.

   ```
   lsnrctl services
   ```

3. Make sure the password file was restored or created for the new database.

   ```
   ls -ltr $ORACLE_HOME/dbs/orapw<oracle sid>
   ```

   If the file does not exist, create it using the orapwd utility.

   ```
   orapwd file=<$ORACLE_HOME/dbs/orapw<$ORACLE_SID>> password=<sys password>
   ```

4. Make sure the restored database if open in read write mode.

   ```
   select open_mode from v$database;
   ```

   The command output should indicate read write mode. The `dbcli register-database` command will attempt to run datapatch, which requires read write mode. If there are PDBs, they should also be in read write mode to ensure that datapatch runs on them.
5. From oracle home on the restored database, use the following command verify the connection to SYS:

   ```
   conn sys/<password>@//<hostname>:1521/<database service name>
   ```

   This connection is required to register the database later. Fix any connection issues before continuing.
6. Make sure the database is running on spfile by using the SQL*Plus command.

   ```
   SHOW PARAMETERS SPFILE
   ```

7. (Optional) If you would like to manage the database backup with the dbcli command line interface, you can associate a new or existing backup configuration with the migrated

database when you register it or after you register it. A backup configuration defines the backup destination and recovery window for the database. Use the following commands to create, list, and display backup configurations:

- dbcli update-backupconfig
- dbcli list-backupconfigs
- dbcli describe-backupconfig

8. Copy the folder `$ORACLE_HOME/sqlpatch` from source database to the target database. This will enable the `dbcli register-database` command to roll back any conflicting patches.

Note

If you are migrating a version 11.2 database, additional steps are required after you register the database. For more information, see Rolling Back Patches on a Version 11.2 Database.

Registering the Database on the DB System

The dbcli register-database command registers the restored database to the dcs-agent so it can be managed by the dcs-agent stack.

Note

The `dbcli register-database` command is not available on 2-node RAC DB systems.

As the root user, use the `dbcli register-database` command to register the database on the DB system, for example:

```
[root@dbsys ~]# dbcli register-database --dbclass OLTP --dbshape odb1 --servicename tdetest --
syspassword
Password for SYS:
```

```
{
  "jobId" : "317b430f-ad5f-42ae-bb07-13f053d266e2",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "August 08, 2016 05:55:49 AM EDT",
  "description" : "Database service registration with db service name: tdetest",
  "updatedTime" : "August 08, 2016 05:55:49 AM EDT"
}
```

UPDATING TNSNAMES.ORA

Check the `tnsnames.ora` in the backup location, check the database links used in the cloned database, and then add any relevant connection strings to the cloned database file at `$ORACLE_HOME/network/admin/tnsnames.ora`.

ROLLING BACK PATCHES ON A VERSION 11.2 DATABASE

For version 11.2 databases, the sqlpatch application is not automated, so any interim patches (previously known as a "one-off" patches) applied to the source database that are not part of the installed PSU must be rolled back manually in the target database. After registering the database, execute the `catbundle.sql` script and then the `postinstall.sql` script with the corresponding PSU patch (or the overlay patch on top of the PSU patch), as described below.

Tip

Some interim patches may include files written to the $ORACLE_HOME/rdbms/admin directory as well as the $ORACLE_HOME/sqlpatch directory. Oracle recommends that you roll back these patches in the source database using the instructions in the patch read-me prior to migrating the database to OCI environment. Contact Oracle Support if you need assistance with rolling back these patches.

1. On the DB System, use the `dbcli list-dbhomes` command to find the PSU patch number for the version 11.2 database home. In the following sample command output, the PSU patch number is the second number in the DB Version column:

```
[root@dbsys ~]# dbcli  list-dbhomes
ID                                   Name               DB Version
Home Location                             Status
------------------------------------ -----------------  ------------------------------------  --
----------------------------------------- ----------
59d9bc6f-3880-4d4f-b5a6-c140f16f8c64 OraDB11204_home1  11.2.0.4.160719 (23054319, 23054359)
/u01/app/oracle/product/11.2.0.4/dbhome_1 Configured
```

   (The first patch number, 23054319 in the example above, is for the OCW component in the database home.)

2. Find the overlay patch, if any, by using the `lsinventory` command. In the following example, patch number *24460960* is the overlay patch on top of the 23054359 PSU patch.

```
$ $ORACLE_HOME/OPatch/opatch lsinventory
...
Installed Top-level Products (1):

Oracle Database 11g                                                  11.2.0.4.0
There are 1 products installed in this Oracle Home.

Interim patches (5) :

Patch  24460960     : applied on Fri Sep 02 15:28:17 UTC 2016
Unique Patch ID:  20539912
   Created on 31 Aug 2016, 02:46:31 hrs PST8PDT
   Bugs fixed:
     23513711, 23065323, 21281607, 24006821, 23315889, 22551446, 21174504
   This patch overlays patches:
     23054359
   This patch needs patches:
     23054359
   as prerequisites
```

3. Start SQL*Plus and execute the `catbundle.sql` script, for example:

```
SQL> startup
SQL> connect / as sysdba
SQL> @$ORACLE_HOME/rdbms/admin/catbundle.sql psu apply
exit
```

4. Apply the sqlpatch, using the overlay patch number from the previous step, for example:

```
SQL> connect / as sysdba
SQL> @$ORACLE_HOME/sqlpatch/24460960/postinstall.sql
exit
```

Note

If the source database has one-off patches installed and those patches are **not** part of the installed PSU in the cloud environment, then the SQL changes that correspond to those one-off patches need to be rolled back. To rollback the SQL changes, copy the `$ORACLE_HOME/sqlpatch/<patch#>/postdeinstall.sql` script from the source environment to the cloud environment and execute the `postdeinstall.sql` script.

POST RESTORE CHECKLIST

After the database is restored and registered on the DB system, use the following checklist to verify the results and perform any post-restore customizations.

1. Make sure the database files were restored in OMF format.
2. Make sure the database is listed in the dbcli list-databases command output.
3. Check for the following external references in the database and update them if necessary:

- External tables: If the source database uses external tables, back up that data and migrate it to the target host.
- Directories: Customize the default directories as needed for the restored database.
- Database links: Make sure all the required TNS entries are updated in the `tnsnames.ora` file in ORACLE_HOME.
- Email and URLs: Make sure any email addresses and URLs used in the database are still accessible from the DB system.
- Scheduled jobs: Review the jobs scheduled in source database and schedule similar jobs as needed in the restored database.

4. If you associated a backup configuration when you registered the database, run a test back up using the dbcli create-backup command.
5. If the restored database contains a CDB and PDBs, verify that patches have been applied to all PDBs.

Using Oracle Data Guard

Note

This topic is not applicable to Exadata DB systems.

This topic explains how to use the Console to manage Data Guard associations in your DB system. To configure a Data Guard system across regions or between on-premises and Oracle Cloud Infrastructure DB systems, you must access the database host directly and use the DGMGRL utility.

For complete information on Oracle Data Guard, see the Data Guard Concepts and Administration documentation on the Oracle Document Portal.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies.

Prerequisites

A Data Guard implementation requires two DB systems, one containing the primary database and one containing the standby database. When you enable Data Guard for a virtual machine DB system database, a new DB system with the standby database is created and associated with the primary database. For a bare metal DB system, the DB system with the database to be used as the standby must already exist before you enable Data Guard.

Tip

A Data Guard configuration on the Oracle Cloud Infrastructure is limited to one standby database per primary database.

Requirement details are as follows:

- Both DB systems must be in the same compartment, and they must be the same shape.
- The database versions and editions must be identical. Data Guard does not support Standard Edition. (Active Data Guard requires Enterprise Edition - Extreme Performance.)
- The database version determines whether Active Data Guard is enabled. If you are using the BYOL licensing model and if your license does not include Active Data Guard, you must either use Enterprise Edition - High Performance or set up Data Guard manually. See Using Oracle Data Guard with the Database CLI.

- Both DB systems must use the same VCN, and port 1521 must be open.
- **Important!** Properly configure the security list ingress and egress rules for the subnets of both DB systems in the Data Guard association to allow TCP traffic to flow between the applicable ports. Ensure that the rules you create are stateful (the default).

  For example, if the subnet of the primary DB System uses the source CIDR 10.0.0.0/24 and the subnet of the standby DB system uses the source CIDR 10.0.1.0/24, create rules as shown in the following example.

  Note

  The egress rules in the example show how to enable TCP traffic only for port 1521, which is a minimum requirement for Data Guard to work. If TCP traffic is already enabled on all of your outgoing ports (0.0.0.0/0), then you need not explicitly add these specific egress rules.

  Security List for Primary DB System's Subnet

```
Ingress Rules:

Stateless: No
Source: 10.0.1.0/24
IP Protocol: TCP
Source Port Range: All
Destination Port Range: 1521
Allows: TCP traffic for ports: 1521

Egress Rules:

Stateless: No
Destination: 10.0.1.0/24
IP Protocol: TCP
Source Port Range: All
Destination Port Range: 1521
Allows: TCP traffic for ports: 1521
```

Security List for Standby DB System's Subnet

```
Ingress Rules:

Stateless: No
Source: 10.0.0.0/24
IP Protocol: TCP
Source Port Range: All
Destination Port Range: 1521
Allows: TCP traffic for ports: 1521

Egress Rules:

Stateless: No
Destination: 10.0.0.0/24
IP Protocol: TCP
Source Port Range: All
Destination Port Range: 1521
Allows: TCP traffic for ports: 1521
```

For information about creating and editing rules, see Security Lists.

Availability Domain and Fault Domain Considerations for Data Guard

Oracle recommends that the DB system of the standby database be in a different availability domain from the DB system of the primary database to improve availability and disaster recovery. If you enable Data Guard for a database and your standby database is in the same availability domain as the primary (either by choice, or because you are working in a single availability domain region), Oracle recommends that you place the standby database in a different fault domain from that of the primary database. Note that if your primary and standby databases are 2-node RAC databases and both are in the same availability domain, only one of the two nodes of the standby database can be in a fault domain that does not include any other nodes from either the primary or standby database. This is because each availability domain has only three fault domains, and the primary and standby databases have a combined total of 4 nodes. For more information on availability domains and fault domains, see Regions and Availability Domains.

Working with Data Guard

Oracle Data Guard ensures high availability, data protection, and disaster recovery for enterprise data. The Oracle Cloud Infrastructure Database Data Guard implementation requires two databases, one in a primary role and one in a standby role. The two databases compose a Data Guard association. Most of your applications access the primary database. The standby database is a transactionally consistent copy of the primary database.

Data Guard maintains the standby database by transmitting and applying redo data from the primary database. If the primary database becomes unavailable, you can use Data Guard to switch or fail over the standby database to the primary role.

Tip

The standby databases in Oracle Cloud Infrastructure Database are physical standbys.

SWITCHOVER

A switchover reverses the primary and standby database roles. Each database continues to participate in the Data Guard association in its new role. A switchover ensures no data loss. You can use a switchover before you perform planned maintenance on the primary database.

FAILOVER

A failover transitions the standby database into the primary role after the existing primary database fails or becomes unreachable. A failover might result in some data loss when you use **Maximum Performance** protection mode.

REINSTATE

Reinstates a database into the standby role in a Data Guard association. You can use the reinstate command to return a failed database into service after correcting the cause of failure.

Note

You can't terminate a primary database that has a Data Guard association with a peer (standby) database. Delete the standby database first. Alternatively, you can perform a switchover to the standby database, and then terminate the primary database.

You can't terminate a DB system that includes Data Guard enabled databases. To remove the Data Guard association:

- For a bare metal DB system database - terminate the standby database.
- For a virtual machine DB system database - terminate the standby DB system.

Using the Console

The Console allows you to enable a Data Guard association between databases, change the role of a database in a Data Guard association using either a *switchover* or a *failover* operation, and *reinstate* a failed database.

When you enable Data Guard, a separate Data Guard association is created for the primary and the standby database.

To enable Data Guard on a bare metal DB system

If you don't already have bare metal DB systems with the databases that will assume the primary and standby roles, create them as described in Managing Bare Metal and Virtual Machine DB Systems. A new DB system includes an initial database.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose the **Compartment** that contains the DB system with the database for which you want to enable Data Guard.
3. Click the name of the DB system that contains the database you want to assume the primary role, and then click the name of that database.

Tip

If Data Guard is already enabled, a shield icon appears next to the database name.

4. Under **Resources**, click **Data Guard Associations**.
5. Click **Enable Data Guard**.
6. In the **Enable Data Guard** dialog box, configure your Data Guard association.
   - **Peer Database Availability Domain:** (Informational) Shows the availability domain of the selected peer DB system. If your database is in a single availability domain region, or if you choose to provision your peer (standby) database in the same availability domain as you primary database, the system provides a fault domain selector for your peer database. Oracle recommends that your peer DB system be in a different fault domain from your primary DB system in such cases. For more information on fault domains, see Fault Domains.
   - **Peer DB System:** Select the DB system that will contain the peer (standby) database.
   - **Protection Mode:** The protection mode used for this Data Guard association. The Console supports only **Maximum Performance**.
   - **Transport Type:** The redo transport type used for this Data Guard association. The Console supports only **Async**.
   - **Database Admin Password:** Enter the primary database admin password. The same password is used for the standby database.

Confirm Database Admin Password: Re-enter the Database Admin Password you specified.

7. Click **Enable**.
   When the association is created, a shield icon appears next to the name of this database and its peer, and their respective roles (primary or standby) are displayed.

To enable Data Guard on a virtual machine DB system

If you don't already have a virtual machine DB system with the database that will assume the primary role, create it as described in Managing Bare Metal and Virtual Machine DB Systems. The new DB system will include the initial database. When you enable Data Guard on the primary database, a new virtual machine DB system will be launched for the standby database.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose the **Compartment** that contains the DB system with the database for which you want to enable Data Guard.
3. Click the name of the DB system that contains the database you want to assume the primary role, and then click the name of that database.

Tip

If Data Guard is already enabled, a shield icon appears next to the database name.

4. Under **Resources**, click **Data Guard Associations**.
5. Click **Enable Data Guard**.
6. In the **Enable Data Guard** dialog box, configure your Data Guard association.
   Display Name: A friendly, display name for the DB system. The name doesn't need to be unique. An Oracle Cloud Identifier (OCID) will uniquely identify the DB system.

Availability Domain: The availability domain in which the DB system resides.

- **Virtual Cloud Network:** (Informational) Shows the VCN in which the DB system will be launched. The VCN of the primary database and the standby database must be the same.
- **Client Subnet:** The subnet to which the DB system should attach.
  Do not use a subnet that overlaps with 192.168.16.16/28, which is used by the Oracle Clusterware private interconnect on the database instance. Specifying an overlapping subnet will cause the private interconnect to malfunction.
- **Hostname Prefix:** Your choice of host name for the DB system. The host name must begin with an alphabetic character, and can contain only alphanumeric characters and hyphens (-). The maximum number of characters allowed for a virtual machine DB system is 16.

  Important

  The host name must be unique within the subnet. If it is not unique, the DB system will fail to provision.

- **Host Domain Name:** The domain name for the DB system. If the selected subnet uses the Oracle-provided Internet and VCN Resolver for DNS name resolution, this field displays the domain name for the subnet and it can't be changed. Otherwise, you can provide your choice of a domain name. Hyphens (-) are not permitted.

  Host and Domain URL: Combines the host and domain names to display the fully qualified domain name (FQDN) for the database. The maximum length is 64 characters.
- **Protection Mode:** The protection mode used for this Data Guard association. The Console supports only **Maximum Performance**.

- **Transport Type:** The redo transport type used for this Data Guard association. The Console supports only **Async**.
- **Database Admin Password:** Enter the primary database admin password. The same password is used for the standby database.

  Confirm Database Admin Password: Re-enter the Database Admin Password you specified.

7. Click **Enable**.
   When the association is created, a shield icon appears next to the name of this database and its peer, and their respective roles (primary or standby) are displayed.

To perform a database switchover

You initiate a switchover operation by using the Data Guard association of the primary database.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose the **Compartment** that contains the DB system with the primary database you want to switch over.
3. Click the DB system name, and then click the name of the primary database.
4. Under **Resources**, click **Data Guard Associations**.
5. For the Data Guard association on which you want to perform a switchover, click the Actions icon (three dots), and then click **Switchover**.
6. In the **Switchover Database** dialog box, enter the database admin password, and then click **OK**.
   This database should now assume the role of the standby, and the standby should assume the role of the primary in the Data Guard association.

To perform a database failover

You initiate a failover operation by using the Data Guard association of the standby database.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose the **Compartment** that contains the DB system with the primary database's peer standby you want to fail over to.
3. Click the DB system name, and then click the name of the standby database.
4. Under **Resources**, click **Data Guard Associations**.
5. For the Data Guard association on which you want to perform a failover, click **Failover**.
6. In the **Failover Database** dialog box, enter the database admin password, and then click **OK**.
   This database should now assume the role of the primary, and the old primary's role should display as **Disabled Standby**.

To reinstate a database

After you fail over a primary database to its standby, the standby assumes the primary role and the old primary is identified as a disabled standby. After you correct the cause of failure, you can reinstate the failed database as a functioning standby for the current primary by using its Data Guard association.

Note

Before you can reinstate a version 12.2 database, you must perform some steps on the database host to stop the database or start it in `MOUNT` mode.

Set your ORACLE_UNQNAME environment variable to the value of the Database Unique Name (as seen in the Console), and then run these commands:

```
srvctl stop database -d db-unique-name -o abort
srvctl start database -d db-unique-name -o mount
```

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose the **Compartment** that contains the DB system with the failed database you want to reinstate.
3. Click the DB system name, and then click the database name.
4. Under **Resources**, click **Data Guard Associations**.
5. For the Data Guard association on which you want to reinstate this database, click the Actions icon (three dots), and then click **Reinstate**.
6. In the **Reinstate Database** dialog box, enter the database admin password, and then click **OK**.
   This database should now be reinstated as the standby in the Data Guard association.

To terminate a Data Guard association on a bare metal DB system

On a bare metal DB system, you remove a Data Guard association by terminating the standby database.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose the **Compartment** that contains the DB system that includes the standby database you want to terminate.
3. Click the DB system name.
4. For the standby database you want to terminate, click the Actions icon (three dots), and then click **Terminate**.
5. In the **Terminate Database** dialog box, enter the name of the database, and then click **OK**.

To terminate a Data Guard association on a virtual machine DB system

On a virtual machine DB system, you remove a Data Guard association by terminating the standby DB system.

1. Open the navigation menu. Under **Database**, click **Bare Metal, VM, and Exadata**.
2. Choose the **Compartment** that contains the standby DB system that you want to terminate.
3. Click the DB system name, click the Actions icon (three dots), and then click **Terminate**.
4. Confirm when prompted.
   The DB system's icon indicates Terminating.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage Data Guard associations:

- CreateDataGuardAssociation
- GetDataGuardAssociation
- ListDataGuardAssociations
- SwitchoverDataGuardAssociation
- FailoverDataGuardAssociation
- ReinstateDataGuardAssociation
- DeleteDbHome - To terminate a bare metal DB system Data Guard association, delete the standby database.
- TerminateDbSystem - To terminate a virtual machine DB system Data Guard association, terminate the standby DB system.

For the complete list of APIs for the Database service, see Database Service API.

Using Oracle Data Guard with the Database CLI

Oracle recommends that you use the Console instead of the database CLI to set up and work with Data Guard in Oracle Cloud Infrastructure. See Using Oracle Data Guard for information and instructions.

Note

This topic is not applicable to Exadata DB systems. You can manually configure Data Guard on Exadata DB systems using native Oracle Database utilities and commands, however this topic explains how set up primary and standby databases using `dbcli`, which is not available on Exadata DB systems. For more information, see *Data Guard Concepts and Administration* for version 18.1, 12.2, 12.1, or 11.2.

This topic explains how to use the database CLI to set up Data Guard with Fast-Start Failover (FSFO) in Oracle Cloud Infrastructure. The following sections explain how to prepare the primary and standby databases, and then configure Data Guard to transmit redo data from the primary database and apply it to the standby database.

Note

This topic assumes that you are familiar with Data Guard and FSFO. To learn more about them, see documentation at the Oracle Document Portal.

Prerequisites

To perform the procedures in this topic, you'll need the following information for the primary and standby databases.

- db_name (or oracle_sid)
- db_unique_name
- oracle home directory (or database home)

To find the database information

After you've launched the primary and standby DB systems and created databases as described later in this topic, you can use the CLI on those systems to find the needed database information.

1. SSH to the DB System.

```
ssh -i <private_key_path> opc@<db_system_ip_address>
```

2. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the root user's profile, which will set the PATH to the dbcli directory (`/opt/oracle/dcs/bin`).

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. To find the db_name (or oracle_sid) and db_uniqueName, run the `dbcli list-databases -j` command.

```
[root@dbsys ~]# dbcli list-databases -j
[ {
  "id" : "80ad855a-5145-4f8f-a08f-406c5e4684ff",
  "name" : "dbtst",
  "dbName" : "dbtst",
  "databaseUniqueName" : "dbtst_phx1cs",
  "dbVersion" : "12.1.0.2",
  "dbHomeId" : "2efe7af7-0b70-4e9b-ba8b-71f11c6fe287",
```

```
  "instanceOnly" : false,
    .
    .
    .
```

4. To find the oracle home directory (or database home), run the `dbcli list-dbhomes` command. If there are multiple database homes on the DB system, use the one that matches the "dbHomeId" in the `dbcli list-databases -j` command output shown above.

```
[root@dbtst ~]# dbcli list-dbhomes

ID                                       Name                 DB Version
     Home Location                                 Status
---------------------------------------- -------------------- --------------------------------
----- ------------------------------------------- ----------
2efe7af7-0b70-4e9b-ba8b-71f11c6fe287     OraDB12102_home1     12.1.0.2.160719 (23739960,
23144544)     /u01/app/oracle/product/12.1.0.2/dbhome_1     Configured
33ae99fe-5413-4392-88da-997f3cd24c0f     OraDB11204_home1     11.2.0.4.160719 (23054319,
23054359)     /u01/app/oracle/product/11.2.0.4/dbhome_1     Configured
```

Creating a Primary DB System

If you don't already have a primary DB system, create one as described in Managing Bare Metal and Virtual Machine DB Systems. The DB system will include an initial database. You can create additional databases by using the dbcli create-database command available on the DB system.

Creating a Standby DB System

Note

The standby database must have the same db_name as the primary database, but it must have a different db_unique_name. If you use the same database name for the standby and primary, you will have to delete the database from the standby DB system by using the `dbcli delete-database` command before you can run the `dbcli create-database` command described below. Deleting and creating the database will take several minutes to complete. The `dbcli` commands must be run as the root user.

1. Create a standby DB system as described in Managing Bare Metal and Virtual Machine DB Systems and wait for the DB system to finish provisioning and become available. You can create the standby DB system in a different availability domain from the primary DB system for availability and disaster recovery purposes (this is strongly recommended). You can create the standby DB system in the primary DB system's cloud network so that both systems are in a single, routable network.
2. SSH to the DB System.

   ```
   ssh -i <private_key_path> opc@<db_system_ip_address>
   ```

3. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the root user's profile, which will set the PATH to the dbcli directory (`/opt/oracle/dcs/bin`).

   ```
   login as: opc

   [opc@dbsys ~]$ sudo su -
   ```

4. The DB system will include an initial database, but you'll need to create a standby database by using the `dbcli create-database` command with the `--instanceonly`

parameter. This parameter creates only the database storage structure and starts the database in nomount mode (no other database files are created).

When using `--instanceonly`, both the `--dbname` and `--adminpassword` parameters are required and they should match the dbname and admin password of the primary database to avoid confusion.

The following sample command prompts for the admin password and then creates a storage structure for a database named dbname.

```
[root@dbsys ~]# dbcli create-database --dbname <same as primary dbname> --databaseUniqueName
<different from primary uniquename> --instanceonly --adminpassword
```

If you are using pluggable databases, also specify the `--cdb` parameter.

For complete command syntax, see dbcli create-database.

5. Wait a few minutes for the `dbcli create-database` command to create the standby database.

   You can use the `dbcli list-jobs` command to verify that the creation job ran successfully, and then the `dbcli list-databases` command verify that the database is configured.

Preparing the Primary DB System

To prepare the primary DB system, you'll need to configure static listeners, update tnsnames.ora, and configure some database settings and parameters.

CONFIGURING THE STATIC LISTENERS

Create static listeners to be used by RMAN and Data Guard Broker.

1. SSH to the primary DB system, log in as the opc or root user, and sudo to the grid OS user.

   ```
   sudo su - grid
   ```

2. Edit `/u01/app/<version>/grid/network/admin/listener.ora` and add the following content to it. The first static listener shown here is optional. The second `DGMGRL` static listener is optional for version 12.1 or later databases, but required for version 11.2 databases.

```
SID_LIST_LISTENER=
  (SID_LIST=
    (SID_DESC=
    (SDU=65535)
    (GLOBAL_DBNAME = <primary_db_unique_name>.<primary_db_domain>)
    (SID_NAME = <primary_oracle_sid>)
    (ORACLE_HOME=<oracle_home_directory>)
    (ENVS="TNS_ADMIN=<oracle_home_directory>/network/admin")
    )
    (SID_DESC=
    (SDU=65535)
       (GLOBAL_DBNAME = <primary_db_unique_name>_DGMGRL.<primary_db_domain>)
    (SID_NAME = <primary_oracle_sid>)
    (ORACLE_HOME=<oracle_home_directory>)
    (ENVS="TNS_ADMIN=<oracle_home_directory>/network/admin")
    )
  )
```

3. Save your changes and then restart the listener.

```
$ srvctl stop listener
$ srvctl start listener
```

ADDING NET SERVICE NAMES TO TNSNAMES.ORA

As the oracle user, edit `$ORACLE_HOME/network/admin/tnsnames.ora` and add the standby database net service name to it.

```
<standby db_unique_name> =
  (DESCRIPTION =
    (SDU=65535)
    (ADDRESS = (PROTOCOL = TCP)(HOST = <standby_server>.<domain>) (PORT = 1521))
    (CONNECT_DATA =
      (SERVER = DEDICATED)
      (SERVICE_NAME = <standby db_unique_name>.<standby db_domain>)
    )
  )
```

The sample above assumes that name resolution is working and that the *<standby_server>.<domain>* is resolvable at the primary database. You can also use the private IP address of the standby server if the IP addresses are routable within a single cloud network (VCN).

CONFIGURING PRIMARY DATABASE PARAMETERS

Tip

If the primary and standby hosts have different directory structures, you might need to set additional parameters that are not discussed here, such as the `log_file_name_convert` parameter. See the RMAN documentation for more information about how to create standbys for hosts with different directory structures.

1. As the oracle user, enable automatic standby file management.

```
SQL> alter system set standby_file_management=AUTO;
```

2. Identify the Broker configuration file names and locations. The commands used for this depend on the type of database storage. If you're not sure of the database storage type, use the dbcli list-databases command on the DB system.

   For ACFS database storage, use the following commands to set the Broker configuration files.

```
SQL> alter system set dg_broker_config_file1='/u02/app/oracle/oradata/<Primary db_unique_
name>/dbs/dr1<Primary db_unique_name>.dat';
SQL> alter system set dg_broker_config_file2='/u02/app/oracle/oradata/<Primary db_unique_
name>/dbs/dr2<Primary db_unique_name>.dat';
```

   For ASM database storage, use the following commands to set the Broker configuration files.

```
SQL> alter system set dg_broker_config_file1='+DATA/<Primary db_unique_name>/dr1<db_unique_
name>.dat';
SQL> alter system set dg_broker_config_file2='+DATA/<Primary db_unique_name>/dr2<db_unique_
name>.dat';
```

3. Enable Broker DMON process for the database.

```
SQL> alter system set dg_broker_start=true;
```

4. Force database logging for all database transactions.

```
SQL> alter database force logging ;
```

5. Add Standby Redo Logs (SRLs), based on the Online Redo Logs (ORLs). On a newly launched DB system, there will be three ORLs of size 1073741824, so create four SRLs of the same size.

   You can use the query below to determine the number and size (in bytes) of the ORLs.

```
SQL> select group#, bytes from v$log;

    GROUP# BYTES
---------- ----------
         1 1073741824
         2 1073741824
         3 1073741824
```

   All of the ORLs must be the same size.

   The SRLs must be the same size as the ORLs, but there must be at least one more SRL than the ORLs. In the example above, there are three ORLs, so four SRLs are required. So specify the current redo logs plus one, and use the same size as the redo logs.

```
SQL> alter database add standby logfile thread 1 size <size>;
```

   There should be only one member in the SRL group (by default, a DB system is created with only one member per SRL group). To ensure this, you can name the file with the following syntax.

```
alter database add standby logfile thread 1 group 4 (<logfile name with full path>) size
1073741824, group 5(<logfile name with full path>) size 1073741824 ...
```

   For ASM/OMF configurations, the above command uses the diskgroup instead of *<logfile name with full path>*.

```
alter database add standby logfile thread 1 group 4 (+RECO) size 1073741824, group 5(+RECO) size
1073741824 ...
```

Tip

ORLs and SRLs should be sized so that log switches do not occur more frequently than every 10 minutes. This requires knowledge of the application and may need to be adjusted after deployment. For more information, see Use Standby Redo Logs and Configure Size Appropriately.

6. Verify that you created the correct number of SRLs.

```
SQL> select group#, bytes from v$standby_log;
```

7. Make sure the database is in ARCHIVELOG mode.

```
SQL> archive log list
```

8. Enable database FLASHBACK. The minimum recommended value for db_flashback_retention_target is 120 minutes.

```
SQL> alter database flashback on ;
SQL> alter system set db_flashback_retention_target=120;
```

9. Perform a single switch redo log to activate archiving if database is newly created. (At least one log must be archived prior to running the RMAN duplicate.)

```
SQL> alter system switch logfile;
```

Preparing the Standby Database

Before you prepare the standby database, make sure the database home on the standby is the same version as on the primary. (If the primary and standby databases are both newly created with the same database version, the database homes will be the same.) If it is not, create a database home that is the same version. You can use the dbcli list-dbhomes command to verify the versions and the dbcli create-dbhome command to create a new database home as needed.

To prepare the standby DB system, you'll need to configure static listeners, update tnsnames.ora, configure TDE Wallet, create a temporary password file, verify connectivity, run RMAN DUPLICATE, enable FLASHBACK, and then create the database service.

CONFIGURING THE STATIC LISTENERS

Create static listeners to be used by RMAN and Data Guard Broker.

1. SSH to the standby DB system, log in as the opc or root user, and sudo to the grid OS user.

   ```
   sudo su - grid
   ```

2. Append the following content to `/u01/app/<db_version>/grid/network/admin/listener.ora`.

   The first static listener shown below is required for RMAN DUPLICATE. The second DGMGRL static listener is optional for database versions 12.2.0.1 and 12.1.0.2, but required for database version 11.2.0.4.

   ```
   SID_LIST_LISTENER=
     (SID_LIST=
       (SID_DESC=
       (SDU=65535)
       (GLOBAL_DBNAME = <standby db_unique_name>.<standby db_domain>)
       (SID_NAME = <standby oracle_sid>)
       (ORACLE_HOME=<oracle home directory>)
       (ENVS="TNS_ADMIN=<oracle home directory>/network/admin")
       )
       (SID_DESC=
       (SDU=65535)
       (GLOBAL_DBNAME = <standby db_unique_name>_DGMGRL.<standby db_domain>)
       (SID_NAME = <standby oracle_sid>)
       (ORACLE_HOME=<oracle home directory>)
       (ENVS="TNS_ADMIN=<oracle home directory>/network/admin")
       )
     )
   ```

3. Restart the listener.

   ```
   $ srvctl stop listener
   $ srvctl start listener
   ```

4. Verify that the static listeners are available. The sample output below is for database version 12.1.0.2. Note that the `...status UNKNOWN` messages are expected at this point.

```
$ lsnrctl status

LSNRCTL for Linux: Version 12.1.0.2.0 - Production on 29-SEP-2016 21:09:25

```

ADDING NET SERVICE NAMES TO TNSNAMES.ORA

As the oracle user, add the standby database net service name to `$ORACLE_HOME/network/admin/tnsnames.ora`. $ORACLE_HOME is the database home where the standby database is running.

```
<Primary db_unique_name> =
  (DESCRIPTION =
    (SDU=65535)
    (ADDRESS = (PROTOCOL = TCP)(HOST = <primary_server>.<domain>) (PORT = 1521))
```

```
    (CONNECT_DATA =
      (SERVER = DEDICATED)
      (SERVICE_NAME = <primary db_unique_name).<primary db_domain>)
    )
  )

<Standby db_unique_name> =
  (DESCRIPTION =
    (SDU=65535)
    (ADDRESS = (PROTOCOL = TCP)(HOST = <standby_server>.<domain>) (PORT = 1521))
    (CONNECT_DATA =
      (SERVER = DEDICATED)
      (SERVICE_NAME = <standby db_unique_name>.<db_domain>)
    )
  )
```

Copying the TDE Wallets to the Standby System

Copy the TDE wallet files from the primary DB system to standby DB system using SCP. The following sample command assumes the SCP command is being run by the oracle OS user and that the private key for oracle has been created and exists on the host where SCP is being run.

```
$ scp -i <private key> primary_server:/opt/oracle/dcs/commonstore/wallets/tde/<primary db_unique_name>/*
standby_server:/opt/oracle/dcs/commonstore/wallets/tde/<standby db_unique_name>
```

Setting Up the Standby System Configuration

As the oracle user, create the following directory for database version 11.2.0.4. This step is optional for version 12.2.0.1 and version 12.1.0.2.

```
[oracle@dbsys ~]$ mkdir  -pv /u03/app/oracle/redo/<standby db_unique_name uppercase>/controlfile
```

Creating the Audit File Destination

As the oracle user, create the following directory to use as the audit file destination.

```
[oracle@dbsys ~]$ mkdir -p /u01/app/oracle/admin/<db_name>/adump
```

Otherwise, the RMAN duplicate command used later will fail.

Creating a Temporary Password File

As the oracle user, create a temporary password file.

```
[oracle@dbsys ~]$ orapwd file=$ORACLE_HOME/dbs/orapw<standby oracle_sid>    password=<admin password for primary> entries=5
```

The password **must** be the same as the admin password of the primary database. Otherwise, the RMAN duplicate step below will fail with: RMAN-05614: Passwords for target and auxiliary connections must be the same when using active duplicate.

VERIFYING THE STANDBY DATABASE IS AVAILABLE

1. As the oracle user, set the environment variables.

   ```
   [oracle@dbsys ~]$ . oraenv
   <enter the db_name>
   ```

2. Replace $ORACLE_HOME/dbs/init*<standby sid_name>*.ora with the following content:

   ```
   db_name=<Primary db_name>
   db_unique_name=<standby db_unique_name>
   db_domain=<standby db_domain>
   ```

3. Remove the spfile from the standby.

   ```
   /u02/app/oracle/oradata/<standby db_unique_name>/dbs/spfile$ORACLE_SID.ora
   ```

   The database needs to be started in nomount mode with no spfile specified, but the original init file contains an spfile parameter which will prevent the RMAN duplicate step from working.

4. Set the ORACLE_UNQNAME environment variable to point to your DB_UNIQUE_NAME.

   ```
   $ export ORACLE_UNQNAME =db_unique_name
   ```

   Important

   If you do not perform this step, the wallet will not be opened, and running the RMAN DUPLICATE command in the subsequent step will fail.

5. The dbcli create-database --instanceonly command used earlier opens the

standby database as a primary in read/write mode, so the database needs to be brought down before proceeding to the nomount step below.

```
$ sqlplus / as sysdba
SQL> shutdown immediate
```

6. Start the database in nomount mode.

```
SQL> startup nomount
```

VERIFYING THE DATABASE CONNECTIONS

Verify the connection between the primary and standby databases.

1. Make sure that the listener port 1521 is open in the security list(s) used for the primary and standby DB systems. For more information, see Updating the Security List for the DB System.
2. From the primary database, connect to standby database.

```
$ sqlplus sys/<password>@<standby net service name> as sysdba
```

3. From standby database, connect to primary database.

```
$ sqlplus sys/<password>@<primary net service name> as sysdba
```

RUNNING THE RMAN DUPLICATE COMMAND

Run the RMAN DUPLICATE command on the standby DB system, as the oracle user.

If the primary database is large, you can allocate additional channels to improve performance. For a newly installed database, one channel typically runs the database duplication in a couple of minutes.

Make sure that there are no errors generated by the RMAN DUPLICATE command. If errors occur, restart the database using the `init.ora` file (not spfile) in case it is generated under `$ORACLE_HOME/dbs` as part of RMAN DUPLICATE.

In the following examples, use lowercase for the *<Standby db_unique_name>* unless otherwise specified.

For ACFS storage layout, run the following commands.

```
$ rman target sys/<password>@<primary alias>  auxiliary sys/<password>@<standby alias> log=rman.out

RMAN> run { allocate channel prim1 type disk;
            allocate auxiliary channel sby type disk;
            duplicate target database for standby from active database
            dorecover
            spfile
            parameter_value_convert '/<Primary db_unique_name>/','/<Standby db_unique_name>/','/<Primary
db_unique_name uppercase>/','/<Standby db_unique_name uppercase >/'
            set db_unique_name='<Standby db_unique_name>'
            set db_create_file_dest='/u02/app/oracle/oradata/<Standby db_unique_name>'
            set dg_broker_config_file1='/u02/app/oracle/oradata/<Standby db_unique_name>/dbs/dr1<Standby
db_unique_name>.dat'
            set dg_broker_config_file2='/u02/app/oracle/oradata/<Standby db_unique_name>/dbs/dr2<Standby
db_unique_name>.dat'
            set dispatchers ='(PROTOCOL=TCP) (SERVICE=<Standby db_unique_name>XDB)'
            set instance_name='<Standby db_unique_name>'
            ;
           }
```

For ASM storage layout, run the following commands.

```
$ rman target sys/<password>@<primary alias>  auxiliary sys/<password>@<standby alias> log=rman.out

RMAN> run { allocate channel prim1 type disk;
            allocate auxiliary channel sby type disk;
            duplicate target database for standby from active database
            dorecover
            spfile
            parameter_value_convert '/<Primary db_unique_name>/','/<Standby db_unique_name>/','/<Primary
db_unique_name uppercase>/','/<Standby db_unique_name uppercase>/'
            set db_unique_name='<Standby db_unique_name>'
            set dg_broker_config_file1='+DATA/<Standby db_unique_name>/dr1<Standby db_unique_name>.dat'
            set dg_broker_config_file2='+DATA/<Standby db_unique_name>/dr2<Standby db_unique_name>.dat'
            set dispatchers ='(PROTOCOL=TCP) (SERVICE=<Standby db_unique_name>XDB)'
            set instance_name='<Standby db_unique_name>'
            ;
          }
```

Enabling Database FLASHBACK

1. As a Data Guard best practice, enable flashback and set `db_flashback_retention_target` to at least 120 minutes on both the primary and standby databases.

```
SQL> alter database flashback on;
SQL> alter system set db_flashback_retention_target=120;
```

2. Verify that the standby database is created properly.

```
SQL> select FORCE_LOGGING, FLASHBACK_ON, OPEN_MODE, DATABASE_ROLE,SWITCHOVER_STATUS, DATAGUARD_
BROKER, PROTECTION_MODE from v$database ;
```

Creating a Database Service

Oracle recommends creating a database service for the standby database by using srvctl.

For ACFS storage layout.

1. Create a shared directory and copy the spfile file to it.

```
$ mkdir -pv /u02/app/oracle/oradata/<Standby db_unique_name>/dbs
$ cp $ORACLE_HOME/dbs/spfile<standby oracle_sid>.ora /u02/app/oracle/oradata/<Standby db_unique_
name>/dbs
```

2. Stop and remove the existing database service.

```
$ srvctl stop database -d <standby db_unique_name>
$ srvctl remove database -d <standby db_unique_name>
```

3. Create the database service.

```
$ srvctl add database -d <standby db_unique_name> -n <standby db_name> -o $ORACLE_HOME -c SINGLE
-p '/u02/app/oracle/oradata/<standby db_unique_name>/dbs/spfile<standby db_name>.ora'
-x <standby hostname> -s "READ ONLY" -r PHYSICAL_STANDBY -i <db_name>
$ srvctl setenv database -d <standby db_unique_name> -t "ORACLE_
UNQNAME=<standby db_unique_name>"
$ srvctl config database -d <standby db_unique_name>
```

4. Start the database service.

```
$ srvctl start database -d <standby db_unique_name>
```

5. Clean up the files from `$ORACLE_HOME/dbs`.

```
$ rm $ORACLE_HOME/dbs/spfile<standby oracle_sid>.ora
$ rm $ORACLE_HOME/dbs/init<standby oracle_sid>.ora
```

6. Create the `$ORACLE_HOME/dbs/init<standby oracle_sid>.ora` file to reference the new location of the spfile file.

```
SPFILE='/u02/app/oracle/oradata/<standby db_unique_name>/dbs/spfile<standby db_name>.ora'
```

7. Stop the standby database and then start it by using srvctl.

```
srvctl stop database -d <standby db_unique_name>
srvctl start database -d <standby db_unique_name>
```

For ASM storage layout.

1. Consider generating the spfile file under +DATA.

```
SQL> create pfile='init<standby oracle_sid>.ora' from spfile ;
SQL> create spfile='+DATA' from pfile='init<standby oracle_sid>.ora' ;
```

2. Stop and remove the existing database service.

```
$ srvctl stop database -d <standby db_unique_name>
$ srvctl remove database -d <standby db_unique_name>
```

3. Create the database service.

```
$ srvctl add database -d <standby db_unique_name> -n <standby db_name>   -o $ORACLE_HOME -c
SINGLE  -p '+DATA/<standby db_unique_name>/PARAMETERFILE/spfile.xxx.xxxxxx'
-x <standby hostname> -s "READ ONLY" -r PHYSICAL_STANDBY -i <db_name>
$ srvctl setenv database -d <standby db_unique_name> -t "ORACLE_UNQNAME=<standby db_unique_name>"
$ srvctl config database -d <standby db_unique_name>
```

4. Start the database service.

```
$ srvctl start database -d <standby db_unique_name>
```

5. Clean up the files from `$ORACLE_HOME/dbs`.

```
$ rm $ORACLE_HOME/dbs/init<standby oracle_sid>.ora
$ rm $ORACLE_HOME/dbs/spfile<standby oracle_sid>.ora
```

6. Create `$ORACLE_HOME/dbs/init<standby oracle_sid>.ora` file to reference the new location of the spfile file.

```
SPFILE='+DATA/<standby db_unique_name>/PARAMETERFILE/spfile.xxx.xxxxxx'
```

7. Stop the database and start the standby database by using srvctl.

```
$ srvctl start database -d <standby db_unique_name>
```

Configuring Data Guard

Perform the following steps to complete the configuration of Data Guard and enable redo transport from the primary database and redo apply in the standby database.

1. Run the dgmgrl command line utility from either the primary or standby DB system and connect to the primary database using sys credentials.

```
DGMGRL> connect sys/<sys password>@<primary tns alias>
```

2. Create the Data Guard configuration and identify for the primary and standby databases.

```
DGMGRL> create configuration mystby as primary database is <primary db_unique_name> connect
identifier is <primary tns alias>;
add database  <standby db_unique_name> as connect identifier is <standby tns alias>  maintained
as physical;
```

3. Enable Data Guard configuration.

```
DGMGRL> enable configuration;
```

4. Verify that Data Guard setup was done properly. Run the following SQL in **both** the primary and standby databases.

```
SQL> select FORCE_LOGGING, FLASHBACK_ON, OPEN_MODE, DATABASE_ROLE, SWITCHOVER_STATUS, DATAGUARD_
BROKER, PROTECTION_MODE from v$database;
```

5. Verify that Data Guard processes are initiated in the standby database.

```
SQL> select PROCESS,PID,DELAY_MINS from V$MANAGED_STANDBY;
```

6. Verify parameter configuration on primary and standby.

```
SQL> show parameter log_archive_dest_
SQL> show parameter log_archive_config
SQL> show parameter fal_server
SQL> show parameter log_archive_format
```

7. Verify that the Data Guard configuration is working. Specifically, make sure redo

shipping and redo apply are working and that the standby is not unreasonably lagging behind the primary.

```
DGMGRL> show configuration verbose
DGMGRL> show database verbose <standby db_unique_name>
DGMGRL> show database verbose <primary db_unique_name>
```

Any discrepancies, errors, or warnings should be resolved. You can also run a transaction on the primary and verify that it's visible in the standby.

8. Verify that the Data Guard configuration is functioning as expected by performing switchover and failover in both directions. Run `show configuration` after each operation and make sure there are no errors or warnings.

Warning

This step is optional, based on your discretion. If for any reason the configuration is not valid, the switchover and/or failover will fail and it might be difficult or impossible to start the primary database. A recovery of the primary might be required, which will affect availability.

```
DGMGRL> switchover to <standby db_unique_name>
DGMGRL> switchover to <primary db_unique_name>

#connect to standby before failover:

DGMGRL> connect sys/<sys password>@<standby db_unique_name>
DGMGRL> failover to <standby db_unique_name>
DGMGRL> reinstate database <primary db_unique_name>

#connect to primary before failover:

DGMGRL> connect sys/<sys password>@<primary db_unique_name>
DGMGRL> failover to <primary db_unique_name>
DGMGRL> reinstate database <standby db_unique_name>
```

Configuring Observer (Optional)

The best practice for high availability and durability is to run the primary, standby, and observer in separate availability domains. The observer determines whether or not to failover to a specific target standby database. The server used for observer requires the Oracle Client Administrator software, which includes the Oracle SQL NET and Broker.

1. Configure TNS alias names for both the primary and standby databases as described previously, and verify the connection to both databases.
2. Change protection mode to either maxavailability or maxperformance (maxprotection is not supported for FSFO).

   To enable maxavailability:

   ```
   DGMGRL> edit database <standby db_unique_name> set property 'logXptMode'='SYNC';
   DGMGRL> edit database <primary db_unique_name> set property 'logXptMode'='SYNC';
   DGMGRL> edit configuration set protection mode as maxavailability;
   ```

   To enable maxperformance:

   ```
   DGMGRL> edit configuration set protection mode as maxperformance;
   DGMGRL> edit database <standby db_unique_name> set property 'logXptMode'='ASYNC';
   DGMGRL> edit database <primary db_unique_name> set property 'logXptMode'='ASYNC';
   ```

   For maxperformance, the FastStartFailoverLaglimit property limits the maximum amount of permitted data loss to 30 seconds by default.
3. The following properties should also be considered. Run `show configuration verbose` to see their current values.
   - FastStartFailoverPmyShutdown
   - FastStartFailoverThreshold
   - FastStartFailoverTarget
   - FastStartFailoverAutoReinstate

   (Running `show configuration` will result in the following error until the observer is started: `Warning : ORA-16819: fast-start failover observer not started`.)
4. Enable fast-start failover from Broker:

   ```
   DGMGRL> Enable fast_start failover
   ```

5. Verify the fast-start failover and associated settings.

```
DGMGRL> show fast_start failover
```

6. Start the observer from Broker (it will run in the foreground, but can also be run in the background).

```
DGMGRL> start observer
```

7. Verify fast-start failover is enabled and without errors or warnings.

```
DGMGRL> show configuration verbose
```

8. Always test failover in both directions to ensure that everything is working as expected. Verify that FSFO is running properly by performing a shutdown abort of the primary database.

   The observer should start the failover to the standby database. If protection mode is set to maxprotection, some loss of data can occur, based on the FastStartFailoverLaglimit value.

Oracle Database CLI Reference

The database CLI (dbcli) is a command line interface available on bare metal and virtual machine DB systems. After you connect to the DB system, you can use the database CLI to perform tasks such as creating Oracle database homes and databases.

Note

The database CLI is **not** for use on Exadata DB systems.

Operational Notes

- The database CLI commands must be run as the root user.
- `dbcli` is in the `/opt/oracle/dcs/bin/` directory.

  This directory is included in the path for the root user's environment.

- Oracle Database maintains logs of the `dbcli` command output in the `dcscli.log` and `dcs-agent.log` files in the `/opt/oracle/dcs/log/` directory.
- The database CLI commands and most parameters are case sensitive and should be typed as shown. A few parameters are not case sensitive, as indicated in the parameter descriptions, and can be typed in uppercase or lowercase.

Warning

Oracle recommends that you avoid specifying parameter values that include confidential information when you use the database CLI commands.

Syntax

The database CLI commands use the following syntax:

```
dbcli command [parameters]
```

where:

- `command` is a verb-object combination such as `create-database`.
- `parameters` include additional options for the command. Most parameter names are preceded with two dashes, for example, `--help`. Abbreviated parameter names are preceded with one dash, for example, `-h`.
- User-specified parameter values are shown in red text within angle brackets, for example, *<db_home_id>*. Omit the angle brackets when specifying these values.
- The help parameter is available with every command.

The remainder of this topic contains syntax and other details about the commands.

CLI Update Command

Occasionally, new commands are added to the database CLI and other commands are updated to support new features. You can use the following command to update the database CLI:

CLIADM UPDATE-DBCLI

Use the `cliadm update-dbcli` command to update the database CLI with the latest new and updated commands.

Note

The `cliadm update-dbcli` command is not available on 2-node RAC DB systems.

SYNTAX

```
cliadm update-dbcli [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command updates the `dbcli`:

```
[root@dbsys ~]# cliadm update-dbcli
{
  "jobId" : "dc9ce73d-ed71-4473-99cd-9663b9d79bfd",
  "status" : "Created",
  "message" : "Dcs cli will be updated",
  "reports" : [ ],
  "createTimestamp" : "January 18, 2017 10:19:34 AM PST",
  "resourceList" : [ ],
  "description" : "dbcli patching",
  "updatedTime" : "January 18, 2017 10:19:34 AM PST"
}
```

Agent Commands

The following commands are available to manage agents:

- dbcli ping-agent
- dbcli list-agentConfigParameters
- dbcli update-agentConfigParameters

DBCLI PING-AGENT

Use the `dbcli ping-agent` command to test the reachability of an agent.

SYNTAX

```
dbcli ping-agent [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

DBCLI LIST-AGENTCONFIGPARAMETERS

Use the `dbcli list-agentConfigParameters` command to list agent configuration parameters.

SYNTAX

```
dbcli list-agentConfigParameters [-n] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-n	-name	(Optional) Parameter name.

DBCLI UPDATE-AGENTCONFIGPARAMETERS

Use the `dbcli update-agentConfigParameters` command to update agent configuration parameters.

SYNTAX

```
dbcli update-agentConfigParameters -n <parameter> [-v <value>] [-a] [-c] [-d] [-u] [-r] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-a	--append	(Optional) Appends the specified values to the specified parameters. Example with multiple parameter names and values: `-n p1 -v v1 -n p2 -v v2 -a`
-c	--comment	(Optional) Adds a comment for the parameter. Default: [ ]
-d	--description	(Optional) Adds a description for the parameter. Default: [ ]
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-n	--name	Parameter name. Example with multiple parameter names and values: `-n p1 -v v1 -n p2 -v v2` Default: [ ]

Parameter	Full Name	Description
-r	--reset	(Optional) Resets the parameter to the default value. Example resetting multiple parameters: `-n p1 -n p2 -r` Default: false
-u	--update	(Optional) Replaces the specified parameter values as directed. Example with multiple parameter names and values: `-n p1 -v v1 -n p2 -v v2 -u` Default: false
-v	--value	(Optional) Parameter value. Example with multiple parameter names and values: `-n p1 -v v1 -n p2 -v v2` Default: [ ]

Autologcleanpolicy Commands

The following commands are available to manage policies for automatic cleaning (purging) of logs.

- dbcli create-autoLogCleanPolicy
- dbcli list-autoLogCleanPolicy

DBCLI CREATE-AUTOLOGCLEANPOLICY

Use the `dbcli create-autoLogCleanPolicy` command to create policies for automatic cleaning (purging) of logs.

SYNTAX

```
dbcli create-autoLogCleanPolicy [-c {gi|database|dcs}] [-f <number>] [-o <number>] [-u
{Day|Hour|Minute}] [-uMB <number>] [-uPer <number>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-c	--components	(Optional) Components to purge. Possible values are gi, database, and dcs. Separate multiple values with commas. Example: `gi,dcs`
-f	--freeSpaceBelowPercentage	(Optional) Purges logs when the free disk space is below the specified percentage of the total partition size. Valid range: 20-50. Default: 20.
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-o	--olderthan	(Optional) Quantity portion of time interval. Default: 30. Cleans logs older than the specified time interval (`-o` and `-u`).
-u	--olderThanUnit	(Optional) Unit portion of time interval. Possible values: Day, Hour, or Minute. Default: Day. Cleans logs older than the specified time interval (`-o` and `-u`).
-uMB	--usageOverMB	(Optional) Purges logs when log usage exceeds the specified number of MegaBytes (MB). Valid range: 10 to 50% of total partition size.
-uPer	--usageOverPercentage	(Optional) Purges logs when log usage exceeds the specified percentage of the total partition size. Valid range: 10-50.

DBCLI LIST-AUTOLOGCLEANPOLICY

Use the `dbcli list-autoLogCleanPolicy` command to list policies for automatic cleaning of logs.

SYNTAX

```
dbcli list-autoLogCleanPolicy [-c {gi|database|dcs}] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-c	--components	(Optional) Components. Possible values are gi, database, and dcs. Separate multiple values with commas. Example: `gi,dcs`
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

Backup Commands

The following commands are available to back up databases:

- dbcli create-backup
- dbcli getstatus-backup
- dbcli schedule-backup

Note

Instead of using `dbcli`, you can use the Console or the API to manage backing up your bare metal or virtual machine DB system databases to Object Storage. However, if you switch from using `dbcli` to using managed backups, a new backup configuration is created and associated with your database, and backups you created by using `dbcli` will not be accessible from the managed backup interfaces. For information about managed backups, see Backing Up to Oracle Cloud Infrastructure Object Storage.

Before you can back up a database by using the dbcli create-backup command, you'll need to:

1. Create a backup configuration by using the dbcli create-backupconfig command.
2. Associate the backup configuration with the database by using the dbcli update-database command.

After a database is associated with a backup configuration, you can use the `dbcli create-backup` command in a `cron` job to run backups automatically. You can use a cron utility such as CronMaker to help build expressions. For more information, see http://www.cronmaker.com.

DBCLI CREATE-BACKUP

Use the `dbcli create-backup` command to create a backup of a database.

SYNTAX

```
dbcli create-backup -in <db_name> -i <db_id> [-bt {Regular-L0|Regular-L1|Longterm|ArchiveLog}] [-c
{Database|TdeWallet}] [-k <n>] [-t <tag>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-bt	--backupType	(Optional) Backup type. Possible values are Regular-L0, Regular-L1, Longterm, and ArchiveLog. Regular-L0 and Regular L1 correspond to incremental L0 and L1 backups. Longterm corresponds to Full backup. ArchiveLog corresponds to archived redo logs backup. The default value is Regular-L1. Values are not case-sensitive. If omitted, the default value is used.

Parameter	Full Name	Description
-c	--component	(Optional) Component. Possible values are Database and TdeWallet. The default value is Database. The value TdeWallet backs up TDE wallets. Values are not case-sensitive. If omitted, the default value is used. **Note** TDE wallets are automatically backed up in the following situations: • A database is created with an Object Storage backup configuration. • A database that has an Object Storage backup configuration is updated. • An Object Storage backup configuration is updated. • A backup of the type Longterm is created. • The TDE key for a database is rotated. • A database is backed up and no TDE wallet backups exist yet.
-h	--help	(Optional) Displays help for using the command.

Parameter	Full Name	Description
-i	--dbid	The ID of the database to back up. Use the `dbcli list-databases` command to get the database's ID.
-in	--dbName	The name of the database to back up. Use the `dbcli list-databases` command to get the database's name.
-j	--json	(Optional) Displays JSON output.
-k	--keepDays	(Optional) Specifies the time until which the backup or copy must be kept. After this time the backup is obsolete, regardless of the backup retention policy settings. For Longterm backup type only.
-t	--tag	(Required for Longterm backup type) Specifies a user-specified tag name for a backup set and applies this tag to the output files generated by the command. This value is not case sensitive. Valid number of characters: 1 to 30. The characters are limited to the characters that are valid in file names on the target file system. For example, ASM does not support the use of the hyphen (-) character in the file names it uses internally, so weekly-incremental is not a valid tag name for backups in ASM disk groups. Environment variables are not valid in the TAG parameter.

EXAMPLES

The following command creates a backup of the specified database using the database ID.

```
[root@dbsys ~]# dbcli create-backup -i 573cadb2-0cc2-4c1c-9c31-595ab8963d5b
```

The following command creates a backup of the specified database using the database name ("mydb").

```
[root@dbsys ~]# dbcli create-backup -in mydb
```

DBCLI GETSTATUS-BACKUP

Use the `dbcli getstatus-backup` command to display the status of a backup.

SYNTAX

```
dbcli getstatus-backup -t <backup_type> [i <id>] [-in <name>] [-l] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--dbId	(Optional) Database Resource ID.
-in	--dbName	(Optional) Database Resource Name.
-j	--json	(Optional) Displays JSON output.
-l	--isLatestBackupReport	(Optional) Latest backup report. Default: true.
-t	--backupType	Backup type.

DBCLI SCHEDULE-BACKUP

Use the `dbcli schedule-backup` command to schedule a backup of a database.

SYNTAX

```
dbcli schedule-backup -t <backup_type> -f <number> [i <id>] [-in <name>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-f	--frequency	Frequency in minutes.
-h	--help	(Optional) Displays help for using the command.

Parameter	Full Name	Description
-i	--dbId	(Optional) Database Resource ID.
-in	--dbName	(Optional) Database Resource Name.
-j	--json	(Optional) Displays JSON output.
-t	--backupType	Backup type.

Backupconfig Commands

A backup configuration determines the backup destination and recovery window for database backups. You create the backup configuration and then associate it with a database by using the `dbcli update-database` command.

Warning

Backups that were configured using the Console may become unusable if you make changes using these commands. For backups configured using the Console, use these commands with support guidance only.

Note

Instead of using `dbcli`, you can use the Console or the API to manage backing up your bare metal or virtual machine DB system databases to Object Storage. For information about managed backups, see Backing Up to Oracle Cloud Infrastructure Object Storage.

After a database is associated with a backup configuration, you can use the `dbcli create-backup` command in a `cron` job to run backups automatically. You can use a cron utility such

as CronMaker to help build expressions. For more information, see http://www.cronmaker.com.

The following commands are available to manage backup configurations:

- dbcli create-backupconfig
- dbcli list-backupconfigs
- dbcli describe-backupconfig
- dbcli update-backupconfig
- dbcli delete-backupconfig

DBCLI CREATE-BACKUPCONFIG

Use the `dbcli create-backupconfig` command to create a backup configuration that defines the backup destination and recovery windows.

SYNTAX

```
dbcli create-backupconfig -d {DISK|OBJECTSTORE|NONE} -c <bucket>  -o <object_store_swift_id> -on
<object_store_swift_name> -w <n> -n <name> [-cr|-no-cr] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-c	--container	The name of an existing bucket in the Oracle Cloud Infrastructure Object Storage service. You can use the Console or the Object Storage API to create the bucket. For more information, see Managing Buckets. You must also specify `--backupdestination objectstore` and the `--objectstoreswiftId` parameter.
-cr -no-cr	--crosscheck --no-crosscheck	(Optional) Indicates whether to enable the crosscheck operation. This operation determines if the files on the disk or in the media management catalog correspond to data in the RMAN repository. If omitted, the default setting is used (crosscheck is enabled by default).
-d	--backupdestination	The backup destination as one of the following (these values are **not** case sensitive): DISK - The local Fast Recovery Area. OBJECTSTORE - The Oracle Cloud Infrastructure Object Storage service. You must also specify the `--container` and `--objectstoreswiftId` parameters. NONE - Disables the backup.
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-n	--name	The name of the backup configuration.

Parameter	Full Name	Description
-o	--objectstoreswiftId	The ID of the object store that contains the endpoint and credentials for the Oracle Cloud Infrastructure Object Storage service. Use the dbcli list-objectstoreswifts command to get the object store ID. Use the dbcli create-objectstoreswift command to create an object store. You must also specify `--backupdestination objectstore` and the `--container` parameter.
-on	--objectstoreswiftName	The name of the object store that contains the endpoint and credentials for the Oracle Cloud Infrastructure Object Storage service. Use the dbcli list-objectstoreswifts command to get the object store name. Use the dbcli create-objectstoreswift command to create an object store. You must also specify `--backupdestination objectstore` and the `--container` parameter.
-w	--recoverywindow	The number of days for which backups and archived redo logs are maintained. The interval always ends with the current time and extends back in time for the number of days specified. For a DISK backup destination, specify 1 to 14 days. For an OBJECTSTORE backup destination, specify 1 to 30 days.

EXAMPLE

The following command creates a backup configuration named dbbkcfg1:

```
[root@dbsys ~]# dbcli create-backupconfig -d Disk -w 7 -n dbbkcfg1
{
```

```
  "jobId" : "4e0e6011-db53-4142-82ef-eb561658a0a9",
  "status" : "Success",
  "message" : null,
  "reports" : [ {
    "taskId" : "TaskParallel_919",
    "taskName" : "persisting backup config metadata",
    "taskResult" : "Success",
    "startTime" : "November 18, 2016 20:21:25 PM UTC",
    "endTime" : "November 18, 2016 20:21:25 PM UTC",
    "status" : "Success",
    "taskDescription" : null,
    "parentTaskId" : "TaskSequential_915",
    "jobId" : "4e0e6011-db53-4142-82ef-eb561658a0a9",
    "tags" : [ ],
    "reportLevel" : "Info",
    "updatedTime" : "November 18, 2016 20:21:25 PM UTC"
  } ],
  "createTimestamp" : "November 18, 2016 20:21:25 PM UTC",
  "description" : "create backup config:dbbkcfg1",
  "updatedTime" : "November 18, 2016 20:21:25 PM UTC"
}
```

DBCLI LIST-BACKUPCONFIGS

Use the `dbcli list-backupconfigs` command to list all the backup configurations in the DB system.

SYNTAX

```
dbcli list-backupconfigs [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command lists a backup configuration:

```
[root@dbsys ~]# dbcli list-backupconfigs

ID                                       Name                 RecoveryWindow     BackupDestination
CreateTime
---------------------------------------- -------------------- ------------------ ----------------- -----
------------------------
ccdd56fe-a40b-4e82-b38d-5f76c265282d     dbbkcfg1             7                  Disk              July
10, 2016 12:24:08 PM UTC
```

DBCLI DESCRIBE-BACKUPCONFIG

Use the `dbcli describe-backupconfig` command to show details about a specific backup configuration.

SYNTAX

```
dbcli describe-backupconfig -i <id> -in <name> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--backupconfigid	The backup configuration ID. Use the `dbcli list-backupconfigs` command to get the ID.
-in	--backupconfigname	The backup configuration name. Use the `dbcli list-backupconfigs` command to get the name.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays details about a backup configuration:

```
[root@dbsys ~]# dbcli describe-backupconfig -i ccdd56fe-a40b-4e82-b38d-5f76c265282d

Backup Config details
----------------------------------------------------------------
```

```
                    ID: ccdd56fe-a40b-4e82-b38d-5f76c265282d
                  Name: dbbkcfg1
        RecoveryWindow: 7
     BackupDestination: Disk
           CreatedTime: July 10, 2016 12:24:08 PM UTC
           UpdatedTime: July 10, 2016 12:24:08 PM UTC
```

DBCLI UPDATE-BACKUPCONFIG

Use the `dbcli update-backupconfig` command to update an existing backup configuration.

SYNTAX

```
dbcli update-backupconfig -i <id> -in <name> -w <n> -c <bucket> -o <object_store_swift_id> -on <object_store_swift_name> [-cr|-no-cr] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-c	--container	The name of an existing bucket in the Oracle Cloud Infrastructure Object Storage service. You can use the Console or the Object Storage API to create the bucket. For more information, see Managing Buckets. You must also specify `--backupdestination objectstore` and the `--objectstoreswiftId` parameter.
-cr -no-cr	--crosscheck --no-crosscheck	(Optional) Indicates whether to enable the crosscheck operation. This operation determines if the files on the disk on in the media management catalog correspond to data in the RMAN repository. If omitted, the default setting is used (crosscheck is enabled by default).
-h	--help	(Optional) Displays help for using the command.

Parameter	Full Name	Description
-i	--backupconfigid	The ID of the backup configuration to update. Use the `dbcli list-backupconfigs` command to get the ID.
-in	--backupconfigname	The name of the backup configuration to update. Use the `dbcli list-backupconfigs` command to get the name.
-j	--json	(Optional) Displays JSON output.
-o	--objectstoreswiftId	The ID of the object store that contains the endpoint and credentials for the Oracle Cloud Infrastructure Object Storage service. Use the dbcli list-objectstoreswifts command to get the object store ID. Use the dbcli create-objectstoreswift command to create an object store. You must also specify `--backupdestination objectstore` and the `--container` parameter.
-on	--objectstoreswiftname	The name of the object store that contains the endpoint and credentials for the Oracle Cloud Infrastructure Object Storage service. Use the dbcli list-objectstoreswifts command to get the object store name. Use the dbcli create-objectstoreswift command to create an object store. You must also specify `--backupdestination objectstore` and the `--container` parameter.
-w	--recoverywindow	The new disk recovery window. For a DISK backup destination, specify 1 to 14 days. For an OBJECTSTORE backup destination, specify 1 to 30 days.

EXAMPLE

The following command updates the recovery window for a backup configuration:

```
[root@dbsys ~]# dbcli update-backupconfig -i ccdd56fe-a40b-4e82-b38d-5f76c265282d -w 5
{
  "jobId" : "0e849291-e1e1-4c7a-8dd2-62b522b9b807",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : 1468153731699,
  "description" : "update backup config: dbbkcfg1",
  "updatedTime" : 1468153731700
}
```

DBCLI DELETE-BACKUPCONFIG

Use the `dbcli delete-backupconfig` command to delete a backup configuration.

SYNTAX

```
dbcli delete-backupconfig -i <id> -in <name> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--id	The backup configuration ID to delete. Use the `dbcli list-backupconfigs` command to get the ID.
-in	--backupconfigname	The name of the backup configuration to delete. Use the `dbcli list-backupconfigs` command to get the name.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command deletes the specified backup configuration:

```
[root@dbsys ~]# dbcli delete-backupconfig -i ccdd56fe-a40b-4e82-b38d-5f76c265282d
```

Bmccredential Commands

The following commands are available to manage credentials configurations, which are required for downloading DB system patches from the Oracle Cloud Infrastructure Object Storage service. For more information, see Patching a DB System.

- dbcli create-bmccredential
- dbcli list-bmccredentials
- dbcli describe-bmccredential
- dbcli delete-bmccredential
- dbcli update-bmccredential

Note

The `bmccredential` commands are not available on 2-node RAC DB systems.

DBCLI CREATE-BMCCREDENTIAL

Use the `dbcli create-bmccredential` command to create a credentials configuration.

PREREQUISITES

Before you can create a credentials configuration, you'll need these items:

- An RSA key pair **in PEM format** (minimum 2048 bits). See How to Generate an API Signing Key.
- The fingerprint of the public key. See How to Get the Key's Fingerprint.
- Your tenancy's OCID and user name's OCID. See Where to Get the Tenancy's OCID and User's OCID.

Then you'll need to upload the public key in the Console. See How to Upload the Public Key.

SYNTAX

```
dbcli create-bmccredential -c [backup|patching|other] -t <tenant_ocid> -u <user_ocid>  -f <fingerprint>
-k <private_key_path> -p|-hp <passphrase> [-n <credentials_name>] [-e <object_store_url>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-c	--credentialsType	The type of Object Storage credentials configuration to create (these values are **not** case sensitive): BACKUP - Reserved for the future use. PATCHING - For downloading patches from the service. OTHER - Reserved for the future use.
-e	--objectStoreUrl	(Optional) The Object Storage endpoint URL. Omit this parameter when `--credentialsType PATCHING` is specified. The following URL is assumed: https://objectstorage.*<region_name>*.oraclecloud.com See Regions and Availability Domains for region name strings.
-f	--fingerPrint	The public key fingerprint. You can find the fingerprint in the Console by clicking your user name in the upper right corner and then clicking **User Settings**. The fingerprint looks something like this: `-f 61:9e:52:26:4b:dd:46:dc:8c:a8:05:6b:9f:0a:30:d2`
-k	--privateKey	The path to the private key file in PEM format, for example: `-k /root/.ssh/privkey`
-h	--help	(Optional) Displays help for using the command.

Parameter	Full Name	Description
-j	--json	(Optional) Displays JSON output.
-n	--name	(Optional) The name for the new credentials configuration. The name is useful for tracking the configuration.
-p -hp	--passPhrase	The passphrase for the public/private key pair, if you specified one when creating the key pair. Specify `-p` (with no passphrase) to be prompted. Specify `-hp` *<passphrase>* to provide the passphrase in the command.
-t	--tenantOcid	Your tenancy OCID. See Where to Find Your Tenancy's OCID. The tenancy OCID looks something like this: `ocid1.tenancy.oc1..<unique_ID>`
-u	--userOcid	The user name OCID for your Oracle Cloud Infrastructure user account. You can find the OCID in the Console: Open the **User** menu () and click **User Settings**. The user name OCID looks something like this: `ocid1.user.oc1..<unique_ID>`

EXAMPLE

The following command creates a credentials configuration:

```
[root@dbsys ~]# dbcli create-bmccredential -c patching -hp mypass -t
ocid1.tenancy.oc1..aaaaaaaaba3pv6wkcr4jqae5f44n2b2m2yt2j6rx32uzr4h25vqstifsfdsq -u
ocid1.user.oc1..aaaaaaaalhdxviuxqi7xevqskscc16edokgldvuf6raskcioq4x2z7watsfa -f
60:9e:56:26:4b:dd:46:dc:8c:a8:05:6d:9f:0a:30:d2 -k /root/.ssh/privkey

{
  "jobId" : "f8c80510-b717-4ee2-a47e-cd380480b28b",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
```

```
  "createTimestamp" : "December 26, 2016 22:46:38 PM PST",
  "resourceList" : [ ],
  "description" : "BMC Credentials Creation",
  "updatedTime" : "December 26, 2016 22:46:38 PM PST"
}
```

DBCLI LIST-BMCCREDENTIALS

Use the `dbcli list-bmccredentials` command to list the credentials configurations on the DB system.

SYNTAX

```
dbcli list-bmccredentials [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command lists the credentials configurations on the DB system:

```
[root@dbsys ~]# dbcli list-bmccredentials
    ID                                       Name           Type          End Point
                              Status
    ---------------------------------------- -------------  ----------    ------------------------------
----------------------------- ----------
    f19d7c8b-d0d5-4jhf-852b-eb2a81cb7ce5     patch1         Patching      https://objectstorage.us-
phoenix-1.oraclecloud.com           Configured
    f1a8741c-b0c4-4jhf-239b-ab2a81jhfde4     patch2         Patching      https://objectstorage.us-
phoenix-1.oraclecloud.com           Configured
```

DBCLI DESCRIBE-BMCCREDENTIAL

Use the `dbcli describe-bmccredential` command to display details about a credentials configuration.

SYNTAX

```
dbcli describe-bmccredential -i <credentials_id> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--id	The ID for the credentials configuration. Use the dbcli list-bmccredentials command to get the ID.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays details about the specified credentials configuration:

```
[root@dbsys ~]# dbcli describe-bmccredential -i 09f9988e-eed5-4dde-8814-890828d1c763

BMC Credentials details
----------------------------------------------------------------
                     ID: 09f9988e-eed5-4dde-8814-890678d1c763
                   Name: patch23
           Tenant OCID: ocid1.tenancy.oc1..aaaaaaaaba3pv6wkcr4jqae5f44n2b2m2yt2j6rx32uzr4h25vqstifsfdsq
             User OCID: ocid1.user.oc1..aaaaaaaalhjhfiuxqi7xevqskscc16edokgldvuf6raskcioq4x2z7watjhf
      Credentials Type: Patching
       objectStore URL: https://objectstorage.us-phoenix-1.oraclecloud.com
                Status: Configured
               Created: January 9, 2017 1:19:11 AM PST
           UpdatedTime: January 9, 2017 1:41:46 AM PST
```

DBCLI DELETE-BMCCREDENTIAL

Use the `dbcli delete-bmccredential` command to delete a credentials configuration.

SYNTAX

```
dbcli delete-bmccredential -i <credentials_id> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--id	The ID for the credentials configuration. Use the dbcli list-bmccredentials command to get the ID.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command deletes the specified credentials configuration:

```
[root@dbsys ~]# dbcli delete-bmccredential -i f19d7c8b-d0d5-4jhf-852b-eb2a81cb7ce5
```

DBCLI UPDATE-BMCCREDENTIAL

Use the `dbcli update-bmccredential` command to update a credentials configuration.

SYNTAX

```
dbcli update-bmccredential -i <credentials_id> -n <credentials_name> -c [backup|patching|other] -p|-hp
<passphrase> -f <fingerprint> -k <private_key_path> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-c	--credentialsType	The type of Object Storage credentials configuration (these values are **not** case sensitive): BACKUP - Reserved for the future use. PATCHING - For downloading patches from the service. OTHER - Reserved for the future use.
-i	--id	The ID for the credentials configuration. Use the dbcli list-bmccredentials command to get the ID.
-f	--fingerPrint	The public key fingerprint, for example: `-f 61:9e:52:26:4b:dd:46:dc:8c:a8:05:6b:9f:0a:30:d2`
-k	--privateKey	The path to the private key file in PEM format, for example: `-k /root/.ssh/privkey`
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-n	--name	(Optional) The name for the credentials configuration. Use the dbcli list-bmccredentials command to get the name.
-p -hp	--passPhrase	The passphrase for the public/private key pair, if you specified one when creating the key pair. Specify `-p` (with no passphrase) to be prompted. Specify `-hp` *<passphrase>* to provide the passphrase in the command.

EXAMPLE

The following command updates a credentials configuration:

```
[root@dbsys ~]# dbcli update-bmccredential -c OTHER -i 6f921b29-61b6-56f4-889a-ce9270621956
{
  "jobId" : "6e95a69e-cf73-4e51-a444-c7e4b9631c27",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "January 19, 2017 12:01:10 PM PST",
  "resourceList" : [ ],
  "description" : "Update BMC Credentials of object 6f921b29-61b6-48f4-889a-ce9270621945",
  "updatedTime" : "January 19, 2017 12:01:10 PM PST"
```

Component Command

DBCLI DESCRIBE-COMPONENT

Tip

Your DB system might not include this newer command. If you have trouble running the command, use the cliadm update-dbcli command to update the database CLI and then retry the command.

Note

The `dbcli describe-component` command is not available on 2-node RAC DB systems. Patching 2-node systems from Object Storage is not supported.

Use the `dbcli describe-component` command to show the installed and available patch versions for the server, storage, and/or database home components in the DB system.

This command requires a valid Object Storage credentials configuration. Use the dbcli create-bmccredential command to create the configuration if you haven't already done so. If the

configuration is missing or invalid, the command fails with the error: `Failed to connect to the object store. Please provide valid details.`

For more information about updating the CLI, creating the credentials configuration, and applying patches, see Patching a DB System.

SYNTAX

```
dbcli describe-component [-s <server_group>] [-d <db_group>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-d	--dbhomes	(Optional) Lists the installed and available patch versions for only the database home components.
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-s	--server	(Optional) Lists the installed and available patch versions for only the server components.

EXAMPLE

The following command to show the current component versions and the available patch versions in the object store:

```
[root@dbsys ~]# dbcli describe-component
System Version
---------------
12.1.2.10.0

Component                                Installed Version    Available Version
---------------------------------------- -------------------- --------------------
OAK                                      12.1.2.10.0          up-to-date
GI                                       12.1.0.2.161018      up-to-date
ORADB12102_HOME1                         12.1.0.2.161018      up-to-date
ORADB12102_HOME2, ORADB12102_HOME3       12.1.0.2.160719      12.1.0.2.161018
```

Database Commands

The following commands are available to manage databases:

- dbcli clone-database
- dbcli create-database
- dbcli delete-database
- dbcli describe-database
- dbcli list-databases
- dbcli modify-database
- dbcli recover-database
- dbcli register-database
- dbcli update-database

DBCLI CLONE-DATABASE

Use the `dbcli clone-database` command to clone a database.

SYNTAX

```
dbcli clone-database -f <name> -u <name> -n <name> [-s <shape>] [-t <type>] [m <sys_password>] [-p <tde_password>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-f	--sourcedbname	Source database name.
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-m	--syspassword	(Optional) Password for SYS.
-n	--dbname	Database name.

Parameter	Full Name	Description
-p	--tdepassword	(Optional) Password for source TDE wallet.
-s	--dbshape	(Optional) Database shape. Examples: odb1, odb2.
-t	--dbtype	(Optional) Database Type: SI
-u	--databaseUniqueName	Database unique name.

DBCLI CREATE-DATABASE

Use the `dbcli create-database` command to create a new database. You can create a database with a new or existing Oracle Database home, however each database home can have only one database.

It takes a few minutes to create the database. After you run the `dbcli create-database` command, you can use the `dbcli list-jobs` command to check the status of the database creation job.

Tip

Wait for the database creation job to complete before you attempt to create another database. Running multiple `dbcli create-database` commands at the same time can result in some of the creation jobs not completing.

Once the database is created, you can use the `dbcli list-databases -j` command to see additional information about the database.

Note

The `dbcli create-database` command is available on bare metal DB systems only.

You must create and activate a master encryption key for any PDBs that you create. After creating or plugging in a new PDB on a 1- or 2-node RAC DB System, use the `dbcli update-tdekey` command to create and activate a master encryption key for the PDB. Otherwise, you might encounter the error `ORA-28374: typed master key not found in wallet` when attempting to create tablespaces in the PDB. In a multitenant environment, each PDB has its own master encryption key which is stored in a single keystore used by all containers. For more information, see "Overview of Managing a Multitenant Environment" in the Oracle Database Administrator's Guide.

SYNTAX

```
dbcli create-database -dh <db_home_id> -cl {OLTP|DSS|IMDB} -n <db_name> -u <unique_name> -bi <bkup_
config_id> -bn <bkup_config_name> -m -s <db_shape> -r {ACFS|ASM} -y {SI|RAC|RACOne} [-dn <name>] -io -d
<pdb_admin_user> [-p <pdb>] [-ns <nlcharset>] [-cs <charset>] [-l <language>] [-dt <territory>] -v
<version> [-c|-no-c] [-co|-no-co] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-bi	--backupconfigid	Defines the backup configuration identifier for future use. Use the `dbcli list-backupconfigs` command to get the ID.
-bn	--backupconfigname	Defines the backup configuration name for future use. Use the `dbcli list-backupconfigs` command to get the name.
-c -no-c	--cdb --no-cdb	(Optional) Indicates whether to create a Container Database. If omitted, a Container Database is not created.
-cs	--characterset	(Optional) Defines the character set for the database. The default is AL32UTF8.
-cl	--dbclass	Defines the database class. The options are OLTP, DSS, or IMDB. The default is OLTP. For Enterprise Editions, all three classes are supported. For Standard Edition, only OLTP is supported.
-co -no-co	--dbconsole --no-dbconsole	(Optional) Indicates whether the Database Console is enabled. If omitted, the console is not enabled. This parameter is not available for a version 11.2.0.4 database on a 2-node RAC DB system. For more information, see To enable the console for a version 11.2.0.4 database on a multi-node DB system .
-d	--pdbadmin	Defines the name of the Pluggable Database (PDB) Admin User. The default value is pdbadmin.

Parameter	Full Name	Description
-dn	--dbdomainname	(Optional) Database domain name (indicates the logical location of the database within the network structure).
-dt	--dbterritory	(Optional) Defines the territory for the database. The default is AMERICA.
-dh	--dbhomeid	Identifies the database home in which to create the database. The database home must be empty because each database home can have only one database. You can use the `dbcli list dbhomes` command to get the DB home ID. If this parameter is omitted, the database is created with a new Oracle home.
-h	--help	(Optional) Displays help for the command.
-j	--json	(Optional) Displays JSON output.
-l	--dblanguage	(Optional) Defines the language for the database. The default is AMERICAN.
-m	--adminpassword	A strong password for SYS, SYSTEM, TDE wallet, and PDB Admin. The password must be 9 to 30 characters and contain at least 2 uppercase, 2 lowercase, 2 numeric, and 2 special characters. The special characters must be _, #, or -. The password must not contain the username (SYS, SYSTEM, and so on) or the word "oracle" either in forward or reversed order and regardless of casing. Specify `-m` (with no password) to be prompted for the password.

Parameter	Full Name	Description
-n	--dbname	Defines the name given to the new database. The database name must begin with an alphabetic character and can contain a maximum of eight alphanumeric characters. Special characters are not permitted.
-ns	--nationalscharacterset	(Optional) Defines the national character set for the database. The default is AL16UTF16.
-p	--pdbname	(Optional) Defines a unique name for the PDB. The PDB name must begin with an alphabetic character and can contain a maximum of 30 alphanumeric characters. The only special character permitted is the underscore (_). The default value is pdb1. PDB names must be unique within a CDB and within the listener to which they are registered. Make sure the PDB name is unique on the system. To ensure uniqueness, do not use the default name value (pdb1).
-r	--dbstorage	Defines the database storage, either ACFS or ASM. The default value is ASM. See Usage Notes for more information.
-s	--dbshape	Identifies the database sizing template to use for the database. For example, odb1, odb2, or odb3. The default is odb1. For more information, see Database Sizing Templates.

Parameter	Full Name	Description
-u	--databaseUniqueName	Defines a unique name for the database to ensure uniqueness within an Oracle Data Guard group (a primary database and its standby databases). The unique name can contain only alphanumeric and underscore (_) characters. The unique name cannot be changed. The unique name defaults to the name specified in the `--dbname` parameter.
-v	--version	Defines the database version as one of the following: • 18.1.0.0 • 12.2.0.1 • 12.1.0.2 (the default) • 11.2.0.4
-y	--dbtype	Defines the database type. Specify SI for a 1-node instance, RAC for a 2-node cluster, or RACOne for 1-node instance with a second node in cold standby mode. The default value is RAC. These values are not case sensitive.

USAGE NOTES

- You cannot mix Oracle Database Standard Edition and Enterprise Edition databases on the same DB system. (You can mix supported database versions on the DB system, but not editions.)
- When `--dbhomeid` is not provided, the `dbcli create-database` command will create a new Oracle Database home.

Note

Bare metal DB systems allow only one database per database home.

- When `--dbhomeid` is provided, the `dbcli create-database` command creates the database using the Oracle home specified. Use the `dbcli list-dbhomes` command to get the dbhomeid. The database home you specify must be empty.
- Oracle Database 12.1 or later databases are supported on both Oracle Automatic Storage Management (ASM) and Oracle ASM Cluster file system (ACFS). The default is Oracle ACFS.
- Oracle Database 11.2 is supported on Oracle ACFS.
- Each database is configured with its own Oracle ACFS file system for the datafiles and uses the following naming convention: `/u02/app/db user/oradata/db` name. The default size of this mount point is 100G.
- Online logs are stored in the `/u03/app/db user/redo/` directory.
- The Oracle Fast Recovery Area (FRA) is located in the `/u03/app/db user/fast_recovery_area` directory.

EXAMPLES

To create a database and be prompted for the password interactively:

```
[root@dbsys ~]# dbcli create-database -n hrdb -c -m -cl OLTP -s odb2 -p pdb1

Password for SYS,SYSTEM and PDB Admin:
{
   "jobId" : "f12485f2-dcbe-4ddf-aee1-de24d37037b6",
   "status" : "Created",
   "message" : null,
   "reports" : [ ],
   "createTimestamp" : "August 08, 2016 03:54:03 AM EDT",
   "description" : "Database service creation with db name: hrdb",
   "updatedTime" : "August 08, 2016 03:54:03 AM EDT"
}
```

To create a database non-interactively, providing the password on the command line:

```
[root@dbsys ~]# dbcli create-database -n crmdb -hm <password> -cl OLTP -s odb2
{
   "jobId" : "30b5e2a6-493b-4461-98b8-78e9a15f8cdd",
   "status" : "Created",
   "message" : null,
   "reports" : [ ],
   "createTimestamp" : "August 08, 2016 03:59:22 AM EDT",
   "description" : "Database service creation with db name: crmdb",
   "updatedTime" : "August 08, 2016 03:59:22 AM EDT"
}
```

DBCLI DELETE-DATABASE

Use the `dbcli delete-database` command to delete a database.

Note

The `dbcli create-database` command is available on bare metal DB systems only.

SYNTAX

```
dbcli  delete-database -i <db_id> -in <db_name> [-fd] [-j] [-h]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-fd	--force	(Optional) Forces the delete operation.
-i	--dbid	The ID of the database to delete. Use the `dbcli list-databases` command to get the database ID.

Parameter	Full Name	Description
-in	--dbName	The name of the database to delete. Use the `dbcli list-databases` command to get the database name.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command deletes the database named 625d9b8a-baea-4994-94e7-4c4a857a17f9:

```
[root@dbsys ~]# dbcli delete-database -i 625d9b8a-baea-4994-94e7-4c4a857a17f9
```

DBCLI DESCRIBE-DATABASE

Use the `dbcli describe-database` command to display database details.

SYNTAX

```
dbcli describe-database -i <db_id> -in <db_name> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--dbid	The ID of the database to display. Use the `dbcli list-databases` command to get the database ID.
-in	--dbName	The name of the database to display. Use the `dbcli list-databases` command to get the database name.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays information for a database named b727bf80-c99e-4846-ac1f-28a81a725df6:

```
[root@dbsys ~]# dbcli describe-dbhome -i b727bf80-c99e-4846-ac1f-28a81a725df6

DB Home details
------------------------------------------------------------
                     ID: b727bf80-c99e-4846-ac1f-28a81a725df6
                   Name: OraDB12102_home1
                Version: 12.1.0.2
          Home Location: /u01/app/orauser/product/12.1.0.2/dbhome_1
                Created: Jun 2, 2016 10:19:23 AM
```

DBCLI LIST-DATABASES

Use the `dbcli list-databases` command to list all databases on the DB system.

SYNTAX

```
dbcli  list-databases [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays a list of databases:

```
[root@dbsys ~]# dbcli  list-databases

ID                                       DB Name    DB Version           CDB        Class    Shape
Storage    Status
---------------------------------------- ---------- -------------------- ---------- -------- -------- --
-------- ----------
80ad855a-5145-4f8f-a08f-406c5e4684ff     dbst       12.1.0.2             true       OLTP     odb2
ACFS       Configured
6f4e36ae-120b-4436-b0bf-d0c4aef9f7c9     db11tsta   11.2.0.4             false      OLTP     odb1

}
```

DBCLI MODIFY-DATABASE

Use the `dbcli modify-database` command to modify a database.

SYNTAX

```
dbcli modify-database -i <db_id> -dh <destination_db_home_id> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-dh	--destdbhomeid	Destination database home ID.
-h	--help	(Optional) Displays help for using the command.
-i	--databaseid	Database ID.
-j	--json	(Optional) Displays JSON output.

DBCLI RECOVER-DATABASE

Use the `dbcli recover-database` command to recover a database.

SYNTAX

```
dbcli recover-database [-br <json>] [-in <db_name>] [-i <db_id>] [-r <time>] [-t {Latest|PITR|SCN}] [-s]
[-l <location>] [-tp <tde_password>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-br	--backupReport	(Optional) JSON input for backup report.
-h	--help	(Optional) Displays help for using the command.
-i	--dbid	(Optional) Database resource ID.
-in	--dbName	(Optional) Database name.

Parameter	Full Name	Description
-j	--json	(Optional) Displays JSON output.
-l	--tdeWalletLocation	(Optional) TDE wallet backup location. TDE wallet should be backed up in tar.gz format.
-r	--recoveryTimeStamp	(Required when recovery type is PITR) Recovery timestamp in the format mm/dd/yyyy hh:mi:ss. Default: [ ]
-s	--scn	(Required when recovery type is SCN) SCN.
-t	--recoverytype	(Required when backup report is provided) Recovery type. Possible values are Latest, PITR, and SCN.
-tp	--tdeWalletPassword	(Optional) TDE wallet password.

DBCLI REGISTER-DATABASE

Use the `dbcli register-database` command to register a database that has been migrated to Oracle Cloud Infrastructure. The command registers the database to the dcs-agent so it can be managed by the dcs-agent stack.

Note

The `dbcli register-database` command is not available on 2-node RAC DB systems.

SYNTAX

```
dbcli  register-database -bi <bkup_config_id> -c {OLTP|DSS|IMDB} [-co|-no-co] -s {odb1|odb2|...} -t SI
[-o <db_host_name>] [-tp <password>] -sn <service_name> -p [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-bi	--backupconfigid	Defines the backup configuration ID. Use the `dbcli list-backupconfigs` command to get the ID.
-c	--dbclass	Defines the database class. The options are OLTP, DSS, or IMDB. The default is OLTP. For Enterprise Editions, all three classes are supported. For Standard Edition, only OLTP is supported.
-co -no-co	--dbconsole --no-dbconsole	(Optional) Indicates whether the Database Console is enabled or not. If omitted, the console is not enabled.
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-o	--hostname	(Optional) Defines the database host name. The default is `Local host name`.
-p	--syspassword	Defines a strong password for SYS. Specify `-p` with no password. You will be prompted for the password. If you must provide the password in the command, for example in a script, use `-hp <password>` instead of `-p`.
-s	--dbshape	Defines the database sizing template to use for the database. For example, odb1, odb2, and odb3. For more information, see Database Sizing Templates.
-sn	--servicename	Defines the database service name used to build the EZCONNECT string for connecting to the database. The connect string format is `hostname:port/servicename`.

Parameter	Full Name	Description
-t	--dbtype	(Optional) Defines the Database Type as single node (SI). The default value is SI.
-tp	--tdeWalletPassword	(Optional) Password for TDE wallet. Required if TDE is enabled on the migrated database.

EXAMPLE

The following command registers the database with the specified database class, service name, and database sizing template.

```
[root@dbsys ~]# dbcli register-database -c OLTP -s odb1 -sn crmdb.example.com -p
Password for SYS:
{
  "jobId" : "317b430f-ad5f-42ae-bb07-13f053d266e2",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "August 08, 2016 05:55:49 AM EDT",
  "description" : "Database service registration with db service name: crmdb.example.com",
  "updatedTime" : "August 08, 2016 05:55:49 AM EDT"
}
```

DBCLI UPDATE-DATABASE

Use the `dbcli update-database` command to associate a backup configuration with a database.

SYNTAX

```
dbcli update-database -i <db_id> -bi <bkup_config_id> -bin <bkup_config_name> [-id <id>] -in <name> [-
no-ab] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-bi	--backupconfigid	Defines the backup configuration ID. Use the `dbcli list-backupconfigs` command to get the ID.
-bin	--backupconfigname	Defines the backup configuration name for future use. Use the `dbcli list-backupconfigs` command to get the name.
-id	--databaseid	(Optional.) Specifies the DBID, which is a unique 32-bit identification number computed when the database is created. RMAN displays the DBID upon connection to the target database. You can obtain the DBID by querying the V$DATABASE view or the RC_DATABASE and RC_DATABASE_INCARNATION recovery catalog views.
-in	--dbName	Defines the database name to be updated. Use the `dbcli list-databases` command to get the database name.
-h	--help	(Optional) Displays help for using the command.
-i	--dbid	Defines the database ID to be updated. Use the `dbcli list-databases` command to get the database ID.

Parameter	Full Name	Description
-j	--json	(Optional) Displays JSON output.
-no-ab	--noautobackup	(Optional) Disables automatic backups for the specified database.  **Note** Once disabled, automatic backup cannot be re-enabled using the CLI. To re-enable automatic backup, use the Console.

EXAMPLE

The following command associates a backup configuration file with a database:

```
[root@dbsys ~]# dbcli update-database -bi 78a2a5f0-72b1-448f-bd86-cf41b30b64ee -i 71ec8335-113a-46e3-
b81f-235f4d1b6fde
{
  "jobId" : "2b104028-a0a4-4855-b32a-b97a37f5f9c5",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : 1467775842977,
  "description" : "update database id:71ec8335-113a-46e3-b81f-235f4d1b6fde",
  "updatedTime" : 1467775842978
}
```

Dbhome Commands

The following commands are available to manage database homes:

- dbcli create-dbhome
- dbcli describe-dbhome

- dbcli delete-dbhome
- dbcli list-dbhomes
- dbcli update-dbhome

DBCLI CREATE-DBHOME

Use the `dbcli create-dbhome` command to create an Oracle Database Home.

SYNTAX

```
dbcli create-dbhome -v <version> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-v	--version	Defines the Database Home version. Specify one of the supported versions: • 18.1.0.0 • 12.2.0.1 • 12.1.0.2 • 11.2.0.4

EXAMPLE

The following command creates an Oracle Database Home version 12.1.0.2:

```
[root@dbsys ~]# dbcli  create-dbhome -v 12.1.0.2
```

DBCLI DESCRIBE-DBHOME

Use the `dbcli describe-dbhome` command to display Oracle Database Home details.

SYNTAX

```
dbcli describe-dbhome -i <db_home_id> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--dbhomeid	Identifies the database home ID. Use the `dbcli list-dbhomes` command to get the ID.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following output is an example of using the display Oracle Database Home details command.

```
[root@dbsys ~]# dbcli describe-dbhome -i 52850389-228d-4397-bbe6-102fda65922b

DB Home details
----------------------------------------------------------------
                     ID: 52850389-228d-4397-bbe6-102fda65922b
                   Name: OraDB12102_home1
                Version: 12.1.0.2
          Home Location: /u01/app/oracle/product/12.1.0.2/dbhome_1
                Created: June 29, 2016 4:36:31 AM UTC
```

DBCLI DELETE-DBHOME

Use the `dbcli delete-dbhome` command to delete a database home from the DB system.

SYNTAX

```
dbcli delete-dbhome -i <db_home_id> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--dbhomeid	Identifies the database home ID to be deleted. Use the `dbcli list-dbhomes` command to get the ID.
-j	--json	(Optional) Displays JSON output.

DBCLI LIST-DBHOMES

Use the `dbcli list-dbhomes` command to display a list of Oracle Home directories.

SYNTAX

```
dbcli list-dbhomes [-h] [-j]
```

PARAMETER

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays a list of Oracle Home directories.

```
[root@dbsys ~]# dbcli  list-dbhomes
ID                                   Name                DB Version Home Location
------------------------------------ ------------------  ---------- ------------------------------------
-----
b727bf80-c99e-4846-ac1f-28a81a725df6 OraDB12102_home1   12.1.0.2
/u01/app/orauser/product/12.1.0.2/dbhome_1
```

DBCLI UPDATE-DBHOME

Tip

Your DB system might not include this newer command. If you have trouble running the command, use the cliadm update-dbcli command to update the database CLI and then retry the command.

Use the `dbcli update-dbhome` command to apply the DBBP bundle patch to a database home. For more information about applying patches, see Patching a DB System.

SYNTAX

```
dbcli update-dbhome -i <db_home_id> -n <node> [--local] [--precheck] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--dbhomeid	The ID of the database home. Use the `dbcli list-dbhomes` command to get the ID.
-j	--json	(Optional) Displays JSON output.
-n	--node	(Optional) Node number to be updated. Use the `dbcli list-nodes` command to get the node number.
	--local	(Optional) Performs the operation on the local node of a multi-node high availability (HA) system. This parameter is not needed to perform the operation on a single-node system.
	--precheck	(Optional) Runs precheck operations to check prerequisites.

EXAMPLE

The following commands update the database home and show the output from the update job:

```
[root@dbsys ~]# dbcli update-dbhome -i e1877dac-a69a-40a1-b65a-d5e190e671e6
{
  "jobId" : "493e703b-46ef-4a3f-909d-bbd123469bea",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "January 19, 2017 10:03:21 AM PST",
  "resourceList" : [ ],
  "description" : "DB Home Patching: Home Id is e1877dac-a69a-40a1-b65a-d5e190e671e6",
  "updatedTime" : "January 19, 2017 10:03:21 AM PST"
}

# dbcli describe-job -i 493e703b-46ef-4a3f-909d-bbd123469bea

Job details
----------------------------------------------------------------
                     ID:  493e703b-46ef-4a3f-909d-bbd123469bea

```

Dbstorage Commands

The following commands are available to manage database storage:

- dbcli list-dbstorages
- dbcli describe-dbstorage
- dbcli create-dbstorage
- dbcli delete-dbstorage

DBCLI LIST-DBSTORAGES

Use the `dbcli list-dbstorages` command to list the database storage in the DB system.

SYNTAX

```
dbcli list-dbstorages [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays details about database storage:

```
[root@dbsys ~]# dbcli list-dbstorages

ID                                       Type   DBUnique Name        Status
---------------------------------------- ------ -------------------- ----------
afb4a1ce-d54d-4993-a149-0f28c9fb33a4     Acfs   db1_2e56b3a9b815     Configured
d81e8013-4551-4d10-880b-d1a796bca1bc     Acfs   db11xp               Configured
```

DBCLI DESCRIBE-DBSTORAGE

Use the `dbcli describe-dbstorage` command to show detailed information about a specific database storage resource.

SYNTAX

```
dbcli describe-dbstorage -i <db_storage_id> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--id	Defines the database storage ID. Use the `dbcli list-dbstorages` command to get the database storage ID.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays the database storage details for 105a2db2-625a-45ba-8bdd-ee46da0fd83a:

```
[root@dbsys ~]# dbcli describe-dbstorage -i 105a2db2-625a-45ba-8bdd-ee46da0fd83a

DBStorage details
----------------------------------------------------------------

                     ID: 105a2db2-625a-45ba-8bdd-ee46da0fd83a
                DB Name: db1
          DBUnique Name: db1
         DB Resource ID: 439e7bd7-f717-447a-8046-08b5f6493df0
           Storage Type:
          DATA Location: /u02/app/oracle/oradata/db1
          RECO Location: /u03/app/oracle/fast_recovery_area/
          REDO Location: /u03/app/oracle/redo/
                  State: ResourceState(status=Configured)
                Created: July 3, 2016 4:19:21 AM UTC
            UpdatedTime: July 3, 2016 4:41:29 AM UTC
```

DBCLI CREATE-DBSTORAGE

Use the `dbcli create-dbstorage` command to create the database storage layout without creating the complete database. This is useful for database migration and standby database

creation.

SYNTAX

```
dbcli create-dbstorage -n <db_name> [-u <db_unique_name>] [-r {ACFS|ASM}] [-s <datasize>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-n	--dbname	Defines the database name. The database name must begin with an alphabetic character and can contain a maximum of eight alphanumeric characters. Special characters are not permitted.
-r	--dbstorage	(Optional) Defines the type of database storage as ACFS or ASM. The default value is ASM.
-s	--dataSize	(Optional) Defines the data size in GBs. The minimum size is 10GB. The default size is 100GB.
-u	--databaseUniqueName	(Optional) Defines the unique name for the database. The default is the database name specified in `--dbname`.

EXAMPLE

The following command creates database storage with a storage type of ACFS:

```
[root@dbsys ~]# dbcli create-dbstorage -r ACFS -n testdb -u testdbname

{
  "jobId" : "5884a77a-0577-414f-8c36-1e9d8a1e9cee",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
```

```
  "createTimestamp" : 1467952215102,
  "description" : "Database storage service creation with db name: testdb",
  "updatedTime" : 1467952215103
}
```

DBCLI DELETE-DBSTORAGE

Use the `dbcli delete-dbstorage` command to delete database storage that is not being used by the database. A error occurs if the resource is in use.

SYNTAX

```
dbcli delete-dbstorage -i <dbstorageID> [-h] [-j]
```

PARAMETERS

Parameter	Parameter	Description
-h	--help	(Optional) Displays help for using the command.
-i	--id	The database storage ID to delete. Use the `dbcli list-dbstorages` command to get the database storage ID.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command deletes the specified database storage:

```
[root@dbsys ~]# dbcli delete-dbstorage -i f444dd87-86c9-4969-a72c-fb2026e7384b

{
  "jobId" : "467c9388-18c6-4e1a-8655-2fd3603856ef",
  "status" : "Running",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : 1467952336843,
  "description" : "Database storage service deletion with id: f444dd87-86c9-4969-a72c-fb2026e7384b",
  "updatedTime" : 1467952336856
}
```

Dgconfig Commands

DBCLI LIST-DGCONFIGS

Use the `dbcli list-dgconfigs` command to list DG configurations.

SYNTAX

```
dbcli list-dgconfigs [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

Featuretracking Commands

DBCLI LIST-FEATURETRACKING

Use the `dbcli list-featuretracking` command to list tracked features.

SYNTAX

```
dbcli list-featuretracking[-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

Job Commands

The following commands are available to manage jobs:

- dbcli describe-job
- dbcli list-jobs

DBCLI DESCRIBE-JOB

Use the `dbcli describe-job` command to display details about a specific job.

SYNTAX

```
dbcli describe-job -i <job_id> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--jobid	Identifies the job. Use the `dbcli list-jobs` command to get the jobid.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays details about the specified job ID:

```
[root@dbsys ~]# dbcli describe-job -i 74731897-fb6b-4379-9a37-246912025c17

Job details
----------------------------------------------------------------
                     ID:  74731897-fb6b-4379-9a37-246912025c17
            Description:  Backup service creation with db name: dbtst
                 Status:  Success

DBCLI LIST-JOBS

Use the `dbcli list-jobs` command to display a list of jobs, including the job IDs, status, and the job

created date and time stamp.

SYNTAX

```
dbcli list-jobs [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays a list of jobs:

```
[root@dbsys ~]# dbcli list-jobs

ID                                       Description
            Created                             Status
---------------------------------------- --------------------------------------------------------------------
------------ ---------------------------------- ----------
0a362dac-0339-41b5-9c9c-4d229e363eaa     Database service creation with db name: db11

```

Latestpatch Command

DBCLI DESCRIBE-LATESTPATCH

Tip

Your DB system might not include this newer command. If you have trouble running the command, use the cliadm update-dbcli command to update the database CLI and then retry the command.

Note

The `dbcli describe-latestpatch` command is not available on 2-node RAC DB systems. Patching 2-node systems from Object Storage is not supported.

Use the `dbcli describe-latestpatch` command show the latest patches applicable to the DB system and available in Oracle Cloud Infrastructure Object Storage.

This command requires a valid Object Storage credentials configuration. Use the dbcli create-bmccredential command to create the configuration if you haven't already done so. If the configuration is missing or invalid, the command fails with the error: `Failed to connect to the object store. Please provide valid details.`

For more information about updating the CLI, creating the credentials configuration, and applying patches, see Patching a DB System.

SYNTAX

```
dbcli describe-latestpatch [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays patches available in the object store:

```
[root@dbsys ~]# dbcli describe-latestpatch

componentType   availableVersion
--------------- --------------------
gi              12.1.0.2.161018
db              11.2.0.4.161018
db              12.1.0.2.161018
oak             12.1.2.10.0
```

Logcleanjob Commands

The following commands are available to manage log cleaning jobs:

- dbcli create-logCleanJob
- dbcli describe-logCleanJob
- dbcli list-logCleanJobs

DBCLI CREATE-LOGCLEANJOB

Use the `dbcli create-logCleanJob` command to create a log cleaning job.

SYNTAX

```
dbcli create-logCleanJob [-c {gi|database|dcs}] [-o <number>] [u {Day|Hour|Minute}] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-c	--components	(Optional) Components. Possible values are gi, database, and dcs. Separate multiple values by commas.
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-o	--olderThan	(Optional) Quantity portion of time interval. Default: 30. Cleans logs older than the specified time interval (`-o` and `-u`).
-u	--unit	(Optional) Unit portion of time interval. Possible values: Day, Hour, or Minute. Default: Day. Cleans logs older than the specified time interval (`-o` and `-u`).

DBCLI DESCRIBE-LOGCLEANJOB

Use the `dbcli describe-logCleanJob` command to display the summary for a log cleaning job.

SYNTAX

```
dbcli describe-logCleanJob -i <job_id> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--jobid	ID of log cleaning job for which to display the summary.
-j	--json	(Optional) Displays JSON output.

DBCLI LIST-LOGCLEANJOBS

Use the `dbcli list-logCleanJobs` command to list log cleaning jobs.

SYNTAX

```
dbcli list-logCleanJobs [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

Logspaceusage Command

DBCLI LIST-LOGSPACEUSAGE

Use the `dbcli list-logSpaceUsage` command to list log space usage.

SYNTAX

```
dbcli list-logSpaceUsage [-c {gi|database|dcs}] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-c	--components	(Optional) Components. Possible values: gi, database, and dcs. Separate multiple values by commas.
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

Netsecurity Commands

The following commands are available to manage network encryption on the DB system:

- dbcli describe-netsecurity
- dbcli update-netsecurity

DBCLI DESCRIBE-NETSECURITY

Use the `dbcli describe-netsecurity` command to display the current network encryption setting for a database home.

SYNTAX

```
dbcli describe-netsecurity -H <db_home_id> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-H	--dbHomeId	Defines the database home ID. Use the `dbcli list-dbhomes` command to get the dbhomeid.
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays the encryption setting for specified database home:

```
[root@dbsys ~]# dbcli describe-netsecurity -H 16c96a9c-f579-4a4c-a645-8d4d22d6889d

NetSecurity Rules
-----------------------------------------------------------------
         DatabaseHomeID: 16c96a9c-f579-4a4c-a645-8d4d22d6889d

                   Role: Server
   EncryptionAlgorithms: AES256 AES192 AES128
    IntegrityAlgorithms: SHA1
         ConnectionType: Required

                   Role: Client
   EncryptionAlgorithms: AES256 AES192 AES128
```

```
    IntegrityAlgorithms: SHA1
         ConnectionType: Required
```

DBCLI UPDATE-NETSECURITY

Use the `dbcli update-netsecurity` command to update the Oracle Net security configuration on the DB system.

SYNTAX

```
dbcli update-netsecurity {-c|-s} -t {REJECTED|ACCEPTED|REQUESTED|REQUIRED} -H db_home_id> -e
{AES256|AES192|AES128} -i {SHA1|SHA512|SHA384|SHA256} [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-c	--client	Indicates that the specified data encryption or data integrity configuration is for the client. (`--client` and `--server` are mutually exclusive.)
-e	--encryptionAlgorithms	Defines the algorithm to be used for encryption. Specify either AES256, AES192, or AES128.
-H	--dbHomeId	Defines the database home ID. Use the `dbcli list-dbhomes` command to get the dbHomeId.
-h	--help	(Optional) Displays help for using the command.
-i	--integrityAlgorithms	Defines the algorithm to be used for integrity. Specify either SHA1, SHA512, SHA384, or SHA256. For Oracle Database 11g, the only accepted value is SHA1.
-j	--json	(Optional) Displays JSON output.

Parameter	Full Name	Description
-s	--server	Indicates that the specified data encryption or data integrity configuration is for the server. (`--client` and `--server` are mutually exclusive.)
-t	--connectionType	Specifies how Oracle Net Services data encryption or data integrity is negotiated with clients. The following values are listed in the order of increasing security: REJECTED - Do not enable data encryption or data integrity, even if required by the client. ACCEPTED - Enable data encryption or data integrity if required or requested by the client. REQUESTED - Enable data encryption or data integrity if the client permits it. REQUIRED - Enable data encryption or data integrity or preclude the connection. For detailed information about network data encryption and integrity, see https://docs.oracle.com/database/121/DBSEG/asoconfg.htm#DBSEG1047.

EXAMPLE

The following command updates the connection type to ACCEPTED:

```
[root@dbsys ~]# dbcli update-netsecurity -H a2ffbb07-c9c0-4467-a458-bce4d3b76cd5 -t ACCEPTED
```

Node Command

DBCLI LIST-NODES

Use the `dbcli list-nodes` command to display a list of nodes, including the node numbers.

SYNTAX

```
dbcli list-nodes [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays a list of nodes:

```
[root@dbsys ~]# dbcli list-nodes
node Number node Name                                ilom Name            IP Address          Subnet              Mask Gate
---------- ---------------------------------------- -------------------- ------------------- ------------
------ ------------------
0          rac21                                     N/A                  N/A                 N/A                 N/A
1          rac22                                     N/A                  N/A                 N/A                 N/A
```

Objectstoreswift Commands

You can back up a database to an existing bucket in the Oracle Cloud Infrastructure Object Storage service by using the dbcli create-backup command, but first you'll need to:

1. Create an object store on the DB system, which contains the endpoint and credentials to access Object Storage, by using the dbcli create-objectstoreswift command.
2. Create a backup configuration that refers to the object store ID and the bucket name by using the dbcli create-backupconfig command.
3. Associate the backup configuration with the database by using the dbcli update-database command.

The following commands are available to manage object stores.

- dbcli create-objectstoreswift
- dbcli describe-objectstoreswift
- dbcli list-objectstoreswifts

DBCLI CREATE-OBJECTSTORESWIFT

Use the `dbcli create-objectstoreswift` command to create an object store.

SYNTAX

```
dbcli create-objectstoreswift -n <object_store_name> -t <tenant_name> -u <user_name> -e
https://swiftobjectstorage.<region_name>.oraclecloud.com/v1 -p [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-e	--endpointurl	The following endpoint URL. `https://swiftobjectstorage.<region_name>.oraclecloud.com/v1` See Regions and Availability Domains for region name strings.
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.
-n	--name	The name for the object store to be created.

Parameter	Full Name	Description
-p	--swiftpassword	The auth token that you generated by using the Console or IAM API. For information about generating an auth token for use with Swift, see Managing User Credentials. This is **not** the password for the Oracle Cloud Infrastructure user. Specify `-p` (with no password) to be prompted. Specify `-hp "<password>"` in quotes to provide the password (auth token) in the command.
-t	--tenantname	The case-sensitive tenant name that you specify when signing in to the Console.
-u	--username	The user name for the Oracle Cloud Infrastructure user account, for example: `-u djones@example.com` This is the user name you use to sign in to the Console. The user name must have tenancy-level access to the Object Storage. An easy way to do this is to add the user name to the Administrators group. However, that allows access to *all* of the cloud services. Instead, an administrator can create a policy that allows tenancy-level access to just Object Storage. The following is an example of such a policy. `Allow group DBAdmins to manage buckets in tenancy` `Allow group DBAdmins to manage objects in tenancy` For more information about adding a user to a group, see Managing Groups. For more information about policies, see Getting Started with Policies.

EXAMPLE

The following command creates an object store and prompts for the Swift password:

```
[root@dbsys ~]# dbcli create-objectstoreswift -n r2swift -t CompanyABC -u djones@example.com -e
https://swiftobjectstorage.<region_name>.oraclecloud.com/v1 -p
Password for Swift:
{
  "jobId" : "c565bb71-f67b-4fab-9d6f-a34eae36feb7",
  "status" : "Created",
  "message" : "Create object store swift",
  "reports" : [ ],
  "createTimestamp" : "January 19, 2017 11:11:33 AM PST",

    "resourceId" : "8a0fe039-f5d4-426a-8707-256c612b3a30",
    "resourceType" : "ObjectStoreSwift",
    "jobId" : "c565bb71-f67b-4fab-9d6f-a34eae36feb7",
    "updatedTime" : "January 19, 2017 11:11:33 AM PST"
  } ],
  "description" : "create object store:biyanr2swift",
  "updatedTime" : "January 19, 2017 11:11:33 AM PST"
}
```

DBCLI DESCRIBE-OBJECTSTORESWIFT

Use the `dbcli describe-objectstoreswift` command to display details about an object store.

SYNTAX

```
dbcli describe-objectstoreswift -i <object_store_swift_id> -in <object_store_swift_name> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--objectstoreswiftid	The object store ID. Use the `dbcli list-objectstoreswifts` command to get the ID.

Parameter	Full Name	Description
-in	--objectstoreswiftName	The object store name. Use the `dbcli list-objectstoreswifts` command to get the name.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command displays details about an object store:

```
[root@dbsys ~]# dbcli describe-objectstoreswift -i 910e9e2d-25b4-49b4-b88e-ff0332f7df87
Object Store details
----------------------------------------------------------------
                     ID: 910e9e2d-25b4-49b4-b88e-ff0332f7df87
                   Name: objstrswift15
               UserName: djones@example.com
             TenantName: CompanyABC
           endpoint URL: https://swiftobjectstorage.<region_name>.oraclecloud.com/v1
            CreatedTime: November 16, 2016 11:25:34 PM UTC
            UpdatedTime: November 16, 2016 11:25:34 PM UTC
```

DBCLI LIST-OBJECTSTORESWIFTS

Use the `dbcli list-objectstoreswifts` command to list the object stores on a DB system.

SYNTAX

```
dbcli list-objectstoreswifts [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command lists the object stores on the DB system:

```
[root@dbsys ~]# dbcli list-objectstoreswifts

ID                                       Name                 UserName              TenantName     Url
                                                          createTime
---------------------------------------- -------------------- --------------------  -------------- -----
- -------------------------------------------------- ----------------------------------
2915bc6a-6866-436a-a38c-32302c7c4d8b     swiftobjstr1         djones@example.com    LargeComputers
https://swiftobjectstorage.<region_name>.oraclecloud.com/v1 November 10, 2016 8:42:18 PM UTC
910e9e2d-25b4-49b4-b88e-ff0332f7df87     objstrswift15        djones@example.com    LargeComputers
https://swiftobjectstorage.<region_name>.oraclecloud.com/v1 November 16, 2016 11:25:34 PM UTC
```

Pendingjob Command

DBCLI LIST-PENDINGJOBS

Use the `dbcli list-pendingjobs` command to display a list of pending jobs.

SYNTAX

```
dbcli list-pendingjobs [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

Rmanbackupreport Commands

The following commands are available to manage RMAN backup reports:

- dbcli create-rmanbackupreport
- dbcli delete-rmanbackupreport
- dbcli describe-rmanbackupreport
- dbcli list-rmanbackupreports

DBCLI CREATE-RMANBACKUPREPORT

Use the `dbcli create-rmanbackupreport` command to create an RMAN backup report.

SYNTAX

```
dbcli create-rmanbackupreport -w {summary|detailed} -rn <name> [-i <db_id>] [-in <db_name>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--dbid	(Optional) Database resource ID.
-in	--dbname	(Optional) Database resource name.
-j	--json	(Optional) Displays JSON output.
-rn	--rptname	RMAN backup report name. Maximum number of characters: 30. Wrap name in single quotes when special characters are used.
-w	--reporttype	RMAN backup report type. Possible values: summary or detailed.

DBCLI DELETE-RMANBACKUPREPORT

Use the `dbcli delete-rmanbackupreport` command to delete an RMAN backup report.

SYNTAX

```
dbcli delete-rmanbackupreport [-d <db_id>] [-dn <db_name>] [-n <number>] [-i <rpt_id>] [-in <rpt_name>]
[-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-d	--dbid	(Optional) Database resource ID.
-dn	--dbname	(Optional) Database resource name.
-h	--help	(Optional) Displays help for using the command.
-i	--reportid	(Optional) RMAN backup report ID
-in	--rptname	(Optional) RMAN backup report name
-j	--json	(Optional) Displays JSON output.
-n	--numofday	(Optional) Number of days since created (provided with Database ID/Database Name)

DBCLI DESCRIBE-RMANBACKUPREPORT

Use the `dbcli describe-rmanbackupreport` command to

SYNTAX

```
dbcli describe-rmanbackupreport [-i <rpt_id>] [-in <rpt_name>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--id	(Optional) RMAN backup report ID
-in	--name	(Optional) RMAN backup report name
-j	--json	(Optional) Displays JSON output.

DBCLI LIST-RMANBACKUPREPORTS

Use the `dbcli list-rmanbackupreports` command to

SYNTAX

```
dbcli list-rmanbackupreports [-i <db_id>] [-in <db_name>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--dbid	(Optional) Database resource ID.
-in	--dbName	(Optional) Database resource name.
-j	--json	(Optional) Displays JSON output.

Schedule Commands

The following commands are available to manage schedules:

- dbcli describe-schedule
- dbcli list-schedules
- dbcli update-schedule

DBCLI DESCRIBE-SCHEDULE

Use the `dbcli describe-schedule` command to describe a schedule.

SYNTAX

```
dbcli describe-schedule -i <id> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--scheduleid	Schedule ID.
-j	--json	(Optional) Displays JSON output.

DBCLI LIST-SCHEDULES

Use the `dbcli list-schedules` command to list schedules.

SYNTAX

```
dbcli list-schedules [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

DBCLI UPDATE-SCHEDULE

Use the `dbcli update-schedule` command to update a schedule.

SYNTAX

```
dbcli update-schedule -i <id> [-x <expression>] [-t <description>] [-d] [-e] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-d	--disable	(Optional) Disables the schedule.
-e	--enable	(Optional) Enables the schedule.
-h	--help	(Optional) Displays help for using the command.
-i	--scheduleid	Schedule ID.
-j	--json	(Optional) Displays JSON output.
-t	--description	(Optional) Description
-x	--cronExpression	(Optional) Cron expression. Use cronmaker.com to generate a valid cron expression.

Scheduledexecution Command

DBCLI LIST-SCHEDULEDEXECUTIONS

Use the `dbcli list-scheduledExecutions` command to list scheduled executions.

SYNTAX

```
dbcli list-scheduledExecutions [-e <execution_id>] [-i <schedule_id>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-e	--executionid	(Optional) Execution ID.
-h	--help	(Optional) Displays help for using the command.

Parameter	Full Name	Description
-i	--scheduleid	(Optional) Schedule ID.
-j	--json	(Optional) Displays JSON output.

Server Command

DBCLI UPDATE-SERVER

Tip

Your DB system might not include this newer command. If you have trouble running the command, use the cliadm update-dbcli command to update the database CLI and then retry the command.

Use the `dbcli update-server` command to apply patches to the server components in the DB system. For more information about applying patches, see Patching a DB System.

SYNTAX

```
dbcli update-server [-n <number>] [--local] [--precheck] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

Parameter	Full Name	Description
-l	--local	(Optional) Performs the operation on the local node of a multi-node high availability (HA) system. This parameter is not needed to perform the operation on a single-node system.
-n	--node	(Optional) Node number to be updated. Use the `dbcli list-nodes` command to get the node number.
-p	--precheck	(Optional) Runs precheck operations to check prerequisites.

EXAMPLES

The following commands update the server and show the output from the update job:

```
[root@dbsys ~]# dbcli update-server
{
  "jobId" : "9a02d111-e902-4e94-bc6b-9b820ddf6ed8",
  "status" : "Created",
  "reports" : [ ],
  "createTimestamp" : "January 19, 2017 09:37:11 AM PST",
  "resourceList" : [ ],
  "description" : "Server Patching",
  "updatedTime" : "January 19, 2017 09:37:11 AM PST"
}

# dbcli describe-job -i 9a02d111-e902-4e94-bc6b-9b820ddf6ed8

Job details
----------------------------------------------------------------
                     ID:  9a02d111-e902-4e94-bc6b-9b820ddf6ed8
            Description:  Server Patching
                 Status:  Running
                Created:  January 19, 2017 9:37:11 AM PST
                Message:

  "description" : "Server Patching Prechecks",
  "updatedTime" : "April 26, 2019 06:07:27 AM UTC"
}
```

System Command

DBCLI DESCRIBE-SYSTEM

Use the `dbcli describe-system` command to display details about the system. On a 2-node RAC DB system, the command provides information about the local node.

SYNTAX

```
dbcli describe-system [-b] [-d] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-b	--bom	(Optional) Displays BOM information.
-d	--details	(Optional) Displays additional information about the DB system, including dcs CLI and agent version information.
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

TDE Commands

The following commands are available to manage TDE-related items (backup reports, keys, and wallets):

- dbcli list-tdebackupreports
- dbcli update-tdekey
- dbcli recover-tdewallet

DBCLI LIST-TDEBACKUPREPORTS

Use the `dbcli list-tdebackupreports` command to list backup reports for TDE wallets.

SYNTAX

```
dbcli  list-tdebackupreports [-i <db_id>] [-in <db_name>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-i	--dbResid	(Optional) Displays the TDE Wallet backup reports for the specified database resource ID. Use the `dbcli list-databases` command to get the database resource ID.
-in	--dbResname	(Optional) Displays the TDE Wallet backup reports for the specified database resource name. Use the `dbcli list-databases` command to get the database resource name.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command lists the backup reports for TDE wallets:

```
[root@dbsys ~]# dbcli list-tdebackupreports
DbResID                                  OraDbId                 BackupLocation

DBCLI UPDATE-TDEKEY

Use the `dbcli update-tdekey` command to update the TDE encryption key inside the TDE wallet. You can update the encryption key for Pluggable Databases (if -pdbNames are

specified), and/or the Container Database (if -rootDatabase is specified).

SYNTAX

```
dbcli update-tdekey -i <db_id> -p [-all] -n <pdbname1,pdbname2> [-r|-no-r] -t <tag_name> [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-all	--allPdbNames	(Optional) Flag to rotate (update) all PDB names. To update all instead of specified PDB names, use this parameter instead of `-n`. Default: false.
-i	--databaseId	Defines the database ID for which to update the key.
-p	--password	Defines the TDE Admin wallet password. Specify `-p` with no password. You will be prompted for the password. If you must provide the password in the command, for example in a script, use `-hp <password>` instead of `-p`.
-n	--pdbNames	Defines the PDB names to be rotated (updated).
-r -no-r	--rootDatabase --no-rootDatabase	Indicates whether to rotate the key for the root database if it is a container database.
-t	-tagName	Defines the TagName used to backup the wallet. The default is OdaRotateKey.
-h	--help	(Optional) Displays help for using the command.
-j	--json	(Optional) Displays JSON output.

EXAMPLE

The following command updates the key for pdb1 and pdb2 only:

```
[root@dbsys ~]# dbcli update-tdekey -dbid ee3eaab6-a45b-4e61-a218-c4ba665503d9 -p -n pdb1,pdb2

TDE Admin wallet password:
{
  "jobId" : "08e5edb1-42e1-4d16-a47f-783c0afa4778",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : 1467876407035,
  "description" : "TDE update",
  "updatedTime" : 1467876407035
}
```

The following command updates pdb1, pdb2, and the container database:

```
[root@dbsys ~]# dbcli update-tdekey -dbid ee3eaab6-a45b-4e61-a218-c4ba665503d9 -p -n pdb1,pdb2 -r

TDE Admin wallet password:
{
  "jobId" : "c72385f0-cd81-42df-a8e8-3a1e7cab1278",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : 1467876433783,
  "description" : "TDE update",
  "updatedTime" : 1467876433783
}
```

DBCLI RECOVER-TDEWALLET

Use the `dbcli recover-tdewallet` command to recover a TDE wallet.

SYNTAX

```
dbcli recover-tdewallet -in <db_name> -tp <password> [-l <location>] [-h] [-j]
```

PARAMETERS

Parameter	Full Name	Description
-h	--help	(Optional) Displays help for using the command.
-in	--dbName	Database name.
-j	--json	(Optional) Displays JSON output.
-l	--tdeWalletBackuplocation	(Optional) TDE wallet backup location. TDE wallet should b ebacked up in tar.gz format.
-tp	--tdeWalletPassword	Defines the TDE Admin wallet password.

Admin Commands

The following commands are to perform administrative actions on the DB system:

- dbadmcli manage diagcollect
- dbadmcli power
- dbadmcli power disk status
- dbadmcli show controller
- dbadmcli show disk
- dbadmcli show diskgroup
- dbadmcli show env_hw (environment type and hardware version)
- dbadmcli show fs (file system details)
- dbadmcli show storage
- dbadmcli stordiag

DBADMCLI MANAGE DIAGCOLLECT

Use the `dbadmcli manage diagcollect` command to collect diagnostic information about a DB system for troubleshooting purposes, and for working with Oracle Support Services.

SYNTAX

```
dbadmcli manage diagcollect --storage [-h]
```

PARAMETERS

Parameter	Description
-h	(Optional) Displays help for using the command.
--storage	Collects all of the logs for any storage issues.

EXAMPLE

```
[root@dbsys ~]# dbadmcli manage diagcollect --storage
Collecting storage log data. It will take a while, please wait...
Collecting oak data. It will take a while, please wait...
tar: Removing leading `/' from member names
tar: /opt/oracle/oak/onecmd/tmp/OakCli-Command-Output.log: file changed as we read it

Logs are collected to : /opt/oracle/oak/log/dbsys/oakdiag/oakStorage-dbsys-20161118_2101.tar.gz
```

DBADMCLI POWER

Use the `dbadmcli power` command to power a disk on or off.

Note

The `dbadmcli power` command is not available on 2-node RAC DB systems.

SYNTAX

```
dbadmcli power {-on|-off} <name> [-h]
```

PARAMETERS

Parameter	Description
-h	(Optional) Displays help for using the command.
name	Defines the disk resource name. The resource name format is pd_[0..3]. Use the `dbadmcli show disk` command to get the disk resource name.
-off	Powers off the disk.
-on	Powers on the disk.

DBADMCLI POWER DISK STATUS

Use the `dbadmcli power disk status` command to display the current power status of a disk.

SYNTAX

```
dbadmcli power disk status <name> [-h]
```

PARAMETERS

Parameter	Description
-h	(Optional) Displays help for using the command.
name	Identifies a specific disk resource name. The resource name format is pd_[0..3]. For example, pd_01.

EXAMPLE

```
[root@dbsys ~]# dbadmcli power disk status pd_00

The disk is powered ON
```

DBADMCLI SHOW CONTROLLER

Use the `dbadmcli show controller` command to display details of the controller.

SYNTAX

```
dbadmcli show controller <controller_id> [-h]
```

PARAMETER

Parameter	Description
controller_id	The ID number of the controller. Use the `dbadmcli show storage` command to get the ID.
-h	(Optional) Displays help for using the command.

DBADMCLI SHOW DISK

Use the `dbadmcli show disk` command to display the status of a single disk or all disks on the DB system.

SYNTAX

```
dbadmcli show disk [<name>] [-shared] [-all] [-getlog] [-h]
```

PARAMETERS

Parameter	Description
-all	(Optional) Displays detailed information for the named disk.
-h	(Optional) Displays help for using the command.
-getlog	(Optional) Displays all the SMART log entries for an NVMe disk.
name	(Optional) Identifies a specific disk resource name. The resource name format is pd_[0..3]. If omitted, the command displays information about all disks on the system.
-shared	(Optional) Displays all the shared disks.

EXAMPLES

To display the status of all the disks on the system:

```
[root@dbsys ~]# dbadmcli show disk
       NAME            PATH            TYPE            STATE           STATE_DETAILS

       pd_00           /dev/nvme2n1    NVD             ONLINE          Good
       pd_01           /dev/nvme3n1    NVD             ONLINE          Good
       pd_02           /dev/nvme1n1    NVD             ONLINE          Good
       pd_03           /dev/nvme0n1    NVD             ONLINE          Good
```

To display the status of a disk named pd_00:

```
[root@dbsys ~]# dbadmcli show disk pd_00
The Resource is : pd_00
       ActionTimeout   :       1500
       ActivePath      :       /dev/nvme2n1
       AsmDiskList     :       |data_00||reco_00|

```

DBADMCLI SHOW DISKGROUP

Use the `dbadmcli show diskgroup` command to list configured diskgroups or display a specific diskgroup configuration.

SYNTAX

To list configured diskgroups:

```
dbadmcli show diskgroup [-h]
```

To display DATA configurations:

```
dbadmcli show diskgroup [DATA] [-h]
```

To display RECO configurations:

```
dbadmcli show diskgroup [RECO] [-h]
```

PARAMETERS

Parameter	Description
DATA	(Optional) Displays the DATA diskgroup configurations.
-h	(Optional) Displays help for using the command.
RECO	(Optional) Displays the RECO diskgroup configurations.

EXAMPLES

To list all diskgroups:

```
[root@dbsys ~]# dbadmcli show diskgroup

DiskGroups
----------
DATA
RECO
```

To display DATA configurations:

```
[root@dbsys ~]# dbadmcli show diskgroup DATA

ASM_DISK       PATH                            DISK    STATE   STATE_DETAILS
data_00        /dev/NVD_S00_S2LHNAAH101026p1   pd_00   ONLINE  Good
data_01        /dev/NVD_S01_S2LHNAAH101008p1   pd_01   ONLINE  Good
```

DBADMCLI SHOW ENV_HW

Use the `dbadmcli show env_hw` command to display the environment type and hardware version of the current DB system.

SYNTAX

```
dbadmcli show env_hw [-h]
```

PARAMETER

Parameter	Description
-h	(Optional) Displays help for using the command.

DBADMCLI SHOW FS

Use the `dbadmcli show fs` command to display file system details.

SYNTAX

```
dbadmcli show fs [-h]
```

PARAMETER

Parameter	Description
-h	(Optional) Displays help for using the command.

DBADMCLI SHOW STORAGE

Use the `dbadmcli show storage` command to show the storage controllers, expanders, and disks.

SYNTAX

```
dbadmcli show storage [-h]
```

To show storage errors:

```
dbadmcli show storage -errors [-h]
```

PARAMETERS

Parameter	Description
-errors	(Optional) Shows storage errors.
-h	(Optional) Displays help for using the command.

EXAMPLE

To display storage devices:

```
[root@dbsys ~]# dbadmcli show storage
==== BEGIN STORAGE DUMP ========
Host Description: Oracle Corporation:ORACLE SERVER X5-2
Total number of controllers: 5
        Id          = 4
        Pci Slot    = -1
        Serial Num  =
        Vendor      =
        Model       =
        FwVers      =
        strId       = iscsi_tcp:00:00.0
        Pci Address = 00:00.0

        Id          = 0

==== END STORAGE DUMP =========
```

DBADMCLI STORDIAG

Use the `dbadmcli stordiag` command to collect detailed information for each disk or NVM Express (NVMe).

SYNTAX

```
dbadmcli stordiag <name> [-h]
```

PARAMETERS

Parameter	Description
name	Defines the disk resource name. The resource name format is pd_[0..3].
-h	(Optional) Displays help for using the command.

EXAMPLE

To display detailed information for NVMe pd_00:

```
[root@dbsys ~]# dbadmcli stordiag pd_0
```

Database Sizing Templates

When you create a database using the `dbcli create-database` command, you can specify a database sizing template with the `--dbshape` parameter. The sizing templates are configured for different types of database workloads. Choose the template that best matches the most common workload your database performs:

- Use the OLTP templates if your database workload is primarily online transaction processing (OLTP).
- Use the DSS templates if your database workload is primarily decision support (DSS) or data warehousing.
- Use the in-memory (IMDB) templates if your database workload can fit in memory, and can benefit from in-memory performance capabilities.

The following tables describe the templates for each type of workload.

OLTP Database Sizing Templates

Template	CPU Cores	SGA (GB)	PGA (GB)	Flash (GB)	Processes	Redo Log File Size (GB)	Log Buffer (MB)
odb1s	1	2	1	6	200	1	16
odb1	1	4	2	12	200	1	16
odb2	2	8	4	24	400	1	16
odb4	4	16	8	48	800	1	32
odb6	6	24	12	72	1200	2	64
odb8	8	32	16	n/a	1600	2	64
odb10	10	40	20	n/a	2000	2	64
odb12	12	48	24	144	2400	4	64
odb16	16	64	32	192	3200	4	64
odb20	20	80	40	n/a	4000	4	64
odb24	24	96	48	192	4800	4	64
odb32	32	128	64	256	6400	4	64
odb36	36	128	64	256	7200	4	64

DSS Database Sizing Templates

Template	CPU Cores	SGA (GB)	PGA (GB)	Processes	Redo Log File Size (GB)	Log Buffer (MB)
odb1s	1	1	2	200	1	16
odb1	1	2	4	200	1	16
odb2	2	4	8	400	1	16
odb4	4	8	16	800	1	32
odb6	6	12	24	1200	2	64
odb8	8	16	32	1600	2	64
odb10	10	20	40	2000	2	64
odb12	12	24	48	2400	4	64
odb16	16	32	64	3200	4	64
odb20	20	40	80	4000	4	64
odb24	24	48	96	4800	4	64
odb32	32	64	128	6400	4	64
odb36	36	64	128	7200	4	64

IN-MEMORY DATABASE SIZING TEMPLATES

Template	CPU Cores	SGA (GB)	PGA (GB)	In-Memory (GB)	Processes	Redo Log Lile Size (GB)	Log Buffer (MB)
odb1s	1	2	1	1	200	1	16
odb1	1	4	2	2	200	1	16
odb2	2	8	4	4	400	1	16
odb4	4	16	8	8	800	1	32
odb6	6	24	12	12	1200	2	64
odb8	8	32	16	16	1600	2	64
odb10	10	40	20	20	2000	2	64
odb12	12	48	24	24	2400	4	64
odb16	16	64	32	32	3200	4	64
odb20	20	80	40	40	4000	4	64
odb24	24	96	48	48	4800	4	64
odb32	32	128	64	64	6400	4	64
odb36	36	128	64	64	7200	4	64

Overview of Autonomous Database

Oracle Cloud Infrastructure's Autonomous Database is a fully managed, preconfigured database environment with two workload types available, Autonomous Transaction Processing and Autonomous Data Warehouse. You do not need to configure or manage any hardware, or install any software. After provisioning, you can scale the number of CPU cores or the storage

capacity of the database at any time without impacting availability or performance. Autonomous Database handles creating the database, as well as the following maintenance tasks:

- Backing up the database
- Patching the database
- Upgrading the database
- Tuning the database

Available Workload Types

Autonomous Database offers two workload types:

- The **Autonomous Transaction Processing** workload type configures the database for a transactional workload, with a bias towards high volumes of random data access.
  For a complete product overview of Autonomous Transaction Processing, see Autonomous Transaction Processing. For Autonomous Transaction Processing tutorials, see Quick Start tutorials.
- The **Autonomous Data Warehouse** workload type configures the database for a decision support or data warehouse workload, with a bias towards large data scanning operations.
  For a complete product overview of Autonomous Data Warehouse, see Autonomous Data Warehouse. For Autonomous Data Warehouse tutorials, see Quick Start tutorials.

Availability

Both Autonomous Database products are currently available in the following regions:

Region Name	Region Location	Region Key
ap-seoul-1	Asia-Pacific: Seoul, South Korea	ICN
ap-tokyo-1	Asia-Pacific: Tokyo, Japan	NRT
ca-toronto-1	Canada: Toronto	YYZ
eu-frankfurt-1	Europe: Frankfurt, Germany	FRA
uk-london-1	United Kingdom: London	LHR
us-ashburn-1	United States: Ashburn, VA	IAD
us-phoenix-1	United States: Phoenix, AZ	PHX

Security Considerations

Autonomous Databases have public IP addresses and therefore are accessible to any client on the internet by default. Oracle recommends that you secure access to your database by using a service gateway or an access control list (ACL).

Service Gateway

Oracle Autonomous Database is one of the Oracle Cloud services that can be privately accessed through a service gateway within a virtual cloud network (VCN). This means you do not need a public IP or NAT to access your Autonomous Database instance from any of the cloud services within the Oracle Services Network. For example, if you have a Compute instance that uses a VCN with a service gateway, you can route traffic between your Compute instance and an Autonomous Database in the same region without the traffic going over the internet. For information on setting up a VCN service gateway and configuring it to access all supported Oracle Service Network services (which include Autonomous Database), see Access to Oracle Services: Service Gateway.

Access Control List (ACL)

An access control list provides additional protection for your Autonomous Database by allowing only the IP addresses in the list to connect to the database.

When you provision a new Autonomous Database, it does not have an initial ACL. You can use the Oracle Cloud Infrastructure Console, API, or CLI to create an ACL for the database by adding a minimum of one entry to the list. An entry can be a comma-separated list of CIDR blocks or public IP addresses. You can modify the list at any time. Removing all entries from the list makes the database accessible to all clients with the applicable credentials. See To manage the access control list of an Autonomous Database to learn how to create, update, or delete an ACL.

Important

If you are using a service gateway and you configure an access control list, you must add the CIDR range 240.0.0.0/4 to the ACL to enable clients accessing the database through the service gateway to connect to it.

Using the Oracle Cloud Infrastructure Console to Manage Autonomous Databases

For information on provisioning, managing, and backing up an Autonomous Database in the Oracle Cloud Infrastructure Console, see the following topics:

- Creating an Autonomous Database
- Managing an Autonomous Database
- Connecting to an Autonomous Database
- Backing Up an Autonomous Database Manually
- Restoring an Autonomous Database

Additional Autonomous Database Product Information

Autonomous Transaction Processing

For in-depth documentation on using and managing your Autonomous Transaction Processing database, see the following topics:

- Getting Started with Autonomous Transaction Processing
- Connecting to Autonomous Transaction Processing
- Loading Data with Autonomous Transaction Processing
- Querying External Data with Autonomous Transaction Processing
- Creating Dashboards, Reports, and Notebooks with Autonomous Transaction Processing
- Managing Users on Autonomous Transaction Processing
- Managing and Monitoring Performance of Autonomous Transaction Processing

For information on using a database client to manage your database, see the following topic:

- Connect Autonomous Transaction Processing Using a Client Application

Autonomous Data Warehouse

For in-depth documentation on using and managing your Autonomous Data Warehouse database, see the following topics:

- Getting Started with Autonomous Data Warehouse Cloud
- Connecting to Autonomous Data Warehouse Cloud
- Loading Data with Autonomous Data Warehouse Cloud
- Migrating Data from Amazon Redshift

- Querying External Data with Autonomous Data Warehouse Cloud
- Creating Dashboards, Reports, and Notebooks with Autonomous Data Warehouse Cloud
- Managing Users on Autonomous Data Warehouse Cloud
- Managing and Monitoring Performance of Autonomous Data Warehouse Cloud

For information on using a database client to manage your database, see the following topic:

- Connect Autonomous Data Warehouse Using a Client Application

Creating an Autonomous Database

This topic describes how to provision a new Autonomous Database using the Oracle Cloud Infrastructure Console or the API. For *Oracle By Example* tutorials on provisioning Autonomous Databases, see Provisioning Autonomous Transaction Processing and Provisioning Autonomous Data Warehouse Cloud.

Prerequisites

- To create an Autonomous Database, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in. See Authentication and Authorization for more information on user authorizations for the Oracle Cloud Infrastructure Database service. See Let database admins manage Autonomous Databases for sample Autonomous Database policies. See Details for the Database Service for detailed information on policy syntax.
- For information on additional prerequisites for provisioning an Autonomous Transaction Processing database, see What Do You Need? Likewise, for information on additional prerequisites for provisioning an Autonomous Data Warehouse, see What Do You Need?

Using the Oracle Cloud Infrastructure Console to Create an Autonomous Database

You can use the console to create either an Autonomous Database with either the Autonomous Transaction Processing or the Autonomous Data Warehouse workload type.

To Create an Autonomous Database

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. In the **Create Autonomous Database** dialog, enter the following:
    - **Workload Type:** Select the desired workload type. See About Autonomous Transaction Processing and About Autonomous Data Warehouse for information about each workload type.
    - **Compartment:** Select the compartment of the Autonomous Database.
    - **Display Name:** A user-friendly description or other information that helps you easily identify the resource. The display name does not have to be unique, and you can change it whenever you like. Avoid entering confidential information.
    - **Database Name:** The database name must consist of letters and numbers only, starting with a letter. The maximum length is 14 characters. Avoid entering confidential information.

      Note

      A database name cannot be used concurrently for both an Autonomous Data Warehouse and an Autonomous Transaction Processing database.

    - **CPU Core Count:** You can enable up to 128 cores for your Autonomous Database. The actual number of available cores is subject to your tenancy's service limits.

- **Storage:** Specify the storage you wish to make available to your Autonomous Database, in terabytes. You can make up to 128 TB available.
- **Administrator Credentials:** Set the password for the Autonomous Database Admin user by entering a password that meets the following criteria. You use this password when accessing the Autonomous Database service console and when using an SQL client tool.
    - Between 12 and 30 characters long
    - Contains at least one lowercase letter
    - Contains at least one uppercase letter
    - Contains at least one number
    - Does not contain the double quotation mark (")
    - Does not contain the string "admin", regardless of casing
- **License Type:** The type of license you want to use for the Autonomous Database. Your choice affects metering for billing. You have the following options:
    - **My Organization Already Owns Oracle Database Software Licenses**: This choice is used for the Bring Your Own License (BYOL) license type. If you choose this option, make sure you have proper entitlements to use for new service instances that you create.
    - **Subscribe to New Database Software Licenses and the Database Cloud Service**: This is used for the License Included license type. With this choice, the cost of the cloud service includes a license for the Database service.
- **Tags:** Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.Avoid entering confidential information.

3. Click **Create Autonomous Database**.

Using the API

Use the CreateAutonomousDatabase API operation to create Autonomous Transaction Processing databases of either the Transaction Processing or Warehouse workload types.

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

For More Information

Autonomous Transaction Processing

Autonomous Data Warehouse

- Using Oracle Autonomous Data Warehouse (the Autonomous Data Warehouse user guide)
- Autonomous Data Warehouse: Tutorials (Oracle By Example tutorials)
- Autonomous Data Warehouse: Videos (video tutorials)

Connecting to an Autonomous Database

This topic gives an overview of connecting a client to an Autonomous Database and describes how to obtain the credentials and information you need to create a connection.

About Connecting to Autonomous Databases

Applications and tools connect to Autonomous Databases by using Oracle Net Services (also known as SQL*Net). SQL*Net supports a variety of connection types to Autonomous

Databases, including Oracle Call Interface (OCI), ODBC drivers, JDBC OC, and JDBC Thin Driver.

To support connections of any type, you'll need to download the client security credentials and network configuration settings required to access your database. You'll also need to supply the applicable TNS names or connection strings for a connection, depending on the client application or tool, type of connection, and service level. You can view or copy the TNS names and connection strings in the DB Connection dialog for your Autonomous Database. For detailed information about the TNS names, see Predefined Database Service Names for Autonomous Transaction Processing and Predefined Database Service Names for Autonomous Data Warehouse.

CONNECTING FROM A VCN

To connect to Autonomous Databases from a VCN, the VCN must be configured with one of the following gateways:

- internet gateway: For access from a public subnet in the VCN
- service gateway: For access from a private subnet in the VCN

Make sure to configure the subnet's route table with a rule that sends the desired traffic to the specific gateway. Also configure the subnet's security lists to allow the desired traffic.

About Downloading Client Credentials

The client credentials .zip that you download contains the following files:

- cwallet.sso - Oracle auto-login wallet
- ewallet.p12 - PKCS #12 wallet file associated with the auto-login wallet
- sqlnet.ora - SQL*Net profile configuration file that includes the wallet location and TNSNAMES naming method
- tnsnames.ora - SQL*Net configuration file that contains network service names mapped to connect descriptors for the local naming method
- Java Key Store (JKS) files - Key store files for use with JDBC Thin Connections

Important

Wallet files, along with the database user ID and password, provide access to data in your Autonomous Database. Store wallet files in a secure location. Share wallet files only with authorized users. If wallet files are transmitted in a way that might be accessed by unauthorized users (for example, over public email), transmit the wallet password separately and securely.

Before You Begin

The Autonomous Database is preconfigured to support Oracle Net Services (a TNS listener is installed and configured to use secure TCPS and client credentials.) The client computer must be prepared to use Oracle Net Services to connect to the Autonomous Database. Preparing your client includes downloading the client credentials. See the following links for steps you might have to perform before you access the client credentials and connection information for your Autonomous Database

Autonomous Transaction Processing

- Preparing for Oracle Call Interface (OCI), ODBC, and JDBC OCI Connections
- Preparing for JDBC Thin Connections

Autonomous Data Warehouse

- Preparing for Oracle Call Interface (OCI), ODBC, and JDBC OCI Connections
- Preparing for JDBC Thin Connections

Using the Oracle Cloud Infrastructure Console

To access the client credentials and connection information for your Autonomous Database

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, click on the display name of the database you are interested in.
4. Click **DB Connection**.
5. To obtain the client credentials, click **Download**.
   You will be prompted to provide a password to encrypt the keys inside the wallet. The password must be at least 8 characters long and must include at least 1 letter and either 1 numeric character or 1 special character.
   Save the client credentials zip file to a secure location. See About Downloading Client Credentials for information about the files included in the download.
6. Take note of or copy the TNS names or connection strings you need for your connection. See About Connecting to Autonomous Databases for information about making connections.

Using the API

Use the GenerateAutonomousDatabaseWallet API operation to download the client credentials for your Autonomous Database.

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

What's Next

For information and instructions on making secure connections to your database, see Connecting to Autonomous Transaction Processing and Connecting to Autonomous Data

Warehouse.

Managing an Autonomous Database

This topic describes the infrastructure management tasks for Autonomous Databases that you complete using the Oracle Cloud Infrastructure Console or the API. Note that some database management tasks not covered here are performed using the Autonomous Transaction Processing service console or the Autonomous Data Warehouse service console.

Prerequisites

To perform the management tasks in this topic, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in. See Authentication and Authorization for more information on user authorizations for the Oracle Cloud Infrastructure Database service. See Let database admins manage Autonomous Databases for sample Autonomous Database policies. See Details for the Database Service for detailed information on policy syntax.

Using the Oracle Cloud Infrastructure Console

You can perform basic administrative tasks for Autonomous Databases in the Oracle Cloud Infrastructure Console including stopping, starting, and scaling your databases. You can also use the Console to back up or to restore the database.

To set the Admin password

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.

3. In the list of Autonomous Databases, click on the display name of the database you wish to administer.
4. Hover over the **Actions** button, and then click **Admin Password**. The Admin Password dialog opens.
5. Enter a password for the Autonomous Database. The password must meet the following criteria:
    - Between 12 and 30 characters long
    - Contains at least one lowercase letter
    - Contains at least one uppercase letter
    - Contains at least one number
    - Does not contain the double quotation mark (")
    - Does not contain the string "admin", regardless of casing
    - Is not one of the last four passwords used for the database
    - Is not a password you previously set within the last 24 hours
6. Enter the password again in the Confirm Password field.
7. Click **Update**.

To scale the CPU core count or storage of an Autonomous Database

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, click on the display name of the database you wish to administer.
4. Click **Scale Up/Down**.
5. Enter a new value for **CPU Core Count** or **Storage** between 1 and 128. The number you enter represents the desired total (final) value for your database's CPU core count

or storage.

The number of available cores is subject to your tenancy's service limits. An Autonomous Database database can have a maximum of 128 cores and 128 TB of storage. Scaling the CPU core count affects your CPU billing.

6. Click **Update**.

To stop or start an Autonomous Database

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, click on the display name of the database you wish to administer.
4. Hover over the **Actions** button, and then click **Stop** (or **Start**). When you stop your Autonomous Database, billing stops for CPU usage. Billing for storage continues when the database is stopped.
5. Confirm that you wish to stop or start your Autonomous Database in the confirmation dialog.

Note

Stopping your database has the following consequences:

- On-going transactions are rolled back.
- CPU billing is halted based on full-hour cycles of usage.
- You will not be able to connect to your database using database clients or tools.

To terminate an Autonomous Database

Warning

Terminating an Autonomous Database permanently deletes it. The database data, including automatic backups, will be lost when the system is terminated. Manual backups remain in Object Storage and are not automatically deleted when you terminate an Autonomous Database. Oracle recommends that you create a manual backup prior to terminating.

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, click on the display name of the database you wish to administer.
4. Hover over the **Actions** button, and then click **Terminate**.
5. Confirm that you wish to terminate your Autonomous Database in the confirmation dialog.

To check the lifecycle state of your Autonomous Database

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, click on the display name of the database you wish to administer.

4. In the Information tab, note the value displayed for **Lifecycle State**. For some lifecycle states, an information icon ( ) is displayed to provide additional details regarding the lifecycle state or ongoing operations such as backups, restores, or terminations. The database has one of the following lifecycle states:
    - Available
    - Available needs attention
    - Backup in progress
    - Provisioning
    - Restore in progress
    - Scaling in progress
    - Starting
    - Stopping
    - Stopped
    - Terminating
    - Terminated
    - Unavailable

To manage tags for your Autonomous Database

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, click on the display name of the database you wish to administer.
4. Hover over the **Actions** button, and then click **Apply Tag(s)** to add new tags. Or click the **Tags** tab to view or edit the existing tags.

For more information, see Resource Tags.

To access the Autonomous Database Service Console

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, click on the display name of the database you wish to administer.
4. Click **Service Console**.

For information on using the Autonomous Transaction Processing service console features, see Managing and Monitoring Performance of Autonomous Transaction Processing. For information on using the Autonomous Data Warehouse service console features, see Managing and Monitoring Performance of Autonomous Data Warehouse Cloud.

To change the license type of an Autonomous Database

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, click on the display name of the database you wish to administer.
4. Hover over the **Actions** button, and then click **Update License Type**.
   The dialog displays the options with your current license type selected.
5. Select the new license type.
6. Click **Update**.

See Known Issue.

To manage the access control list of an Autonomous Database

A newly-provisioned Autonomous Database does not have an access control list. Without one, the database can be accessed by any client with the applicable credentials to connect to it. To create an ACL, you must add at least one CIDR block or public IP address to the list.

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, click on the display name of the database you wish to administer.
4. Hover over the **Actions** button, and then click **Access Control List**.
5. Add or modify entries, as applicable.
   To add CIDR blocks or public IP addresses of clients that can access the database, click **+ Additional Entry**, and then select the IP notation type and enter a comma-separated list of values.

   Important

   If you are using a service gateway, ensure that the CIDR range 240.0.0.0/4 is included in the list to allow clients accessing the database through the service gateway to connect to it.

   To remove the ACL, simply delete all entries in the list. This action allows all clients to connect to the database.
6. Click **Update**.

For information about access control lists, see Access Control List (ACL).

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage Autonomous Databases:

- ListAutonomousDatabases
- GetAutonomousDatabase
- UpdateAutonomousDatabase
- StartAutonomousDatabase
- StopAutonomousDatabase
- DeleteAutonomousDatabase

- Autonomous Data Warehouse Quickstart Tutorials.
- Autonomous Data Warehouse (complete user guide)

Backing Up an Autonomous Database Manually

This topic describes how to create manual backups of Autonomous Databases. You can use the Oracle Cloud Infrastructure Console or the API to perform these tasks.

Oracle Cloud Infrastructure automatically backs up your Autonomous Databases and retains these backups for 60 days. Automatic backups are weekly full backups and daily incremental backups. You can also create manual backups to supplement your automatic backups. Manual backups are stored in an Object Storage bucket that you create, and are retained for 60 days.

Note

During the backup operation, the database remains available. However, lifecycle management operations such as stopping the database, scaling it, or terminating it are disabled.

Prerequisites

- To create or manage Autonomous Database backups, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in. See Authentication and Authorization for more information on user authorizations for the Oracle Cloud Infrastructure Database service. See Let database admins manage Autonomous Databases for sample Autonomous Database policies. See Details for the Database Service for detailed information on policy syntax.
- To create a manual backup for an Autonomous Database, you must first configure an Object Storage bucket to serve as a destination for your manual backups. See Setting Up a Bucket to Store Manual Backups for instructions.

Using the Oracle Cloud Infrastructure Console

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, find the database that you want to back up.
4. Click the name to display the Autonomous Database details.
5. Click **Create Manual Backup**.

Tip

If this step does not successfully complete, confirm that you have an Object Storage bucket set up and configured to store manual backups. See Setting Up a Bucket to Store Manual Backups for instructions.

6. In the **Create Manual Backup** dialog, enter a name for your backup. Avoid entering confidential information.
7. Click **Create**. Your backup may take several hours to complete, depending on the size of your database.
8. Optionally, you can check the state of your backup in the list of backups on the database details page. For some states, an information icon ( ) is displayed to provide additional details regarding the state or ongoing operations like deletions. The backup has one of the following states:
   - Creating
   - Active
   - Deleting
   - Deleted
   - Failed

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use these API operations to manage Autonomous Database backups:

- ListAutonomousDatabaseBackups
- GetAutonomousDatabaseBackup
- CreateAutonomousDatabaseBackup

Setting Up a Bucket to Store Manual Backups

You must create an Oracle Cloud Infrastructure Object Storage bucket to hold your Autonomous Database manual backups and configure your database to connect to it. This is a one-time operation.

To set up an object store and user credentials for your manual backups

Some of the steps in this procedure require you to connect to the database by using an Oracle Database client such as SQL Developer. See Connecting with Oracle SQL Developer (18.2 or later) for information and instructions on connecting to an Autonomous Transaction Processing database. See Connecting with Oracle SQL Developer (18.2 or later) for information and instructions on connecting to an Autonomous Data Warehouse database.

1. If you have not already done so, generate an auth token for the Oracle Cloud Infrastructure Object Storage user to access the bucket you create in the next step. See To create an auth token to learn how to do this. (You will need this auth token for the database credential you create in step 4.)
2. In the Oracle Cloud Infrastructure Console, create a bucket in your designated Object Storage Swift compartment to hold the backups. The format of the bucket name is `backup_databasename`, where *databasename* is lowercase.

For example, if you provision a database named DATABASE1, the bucket name should be `backup_database1`.

Note

When you create your bucket:

- Pick **Standard** as the storage tier. Manual backups are only supported with buckets created in the standard storage tier.
- Ensure that you use the database name, and not the display name, as the bucket name.

3. Using an Oracle Database client, log in to the database as the administrator set the database `default_bucket` property to your Oracle Cloud Infrastructure Object Storage tenancy URL. The format of the tenancy URL is https://swiftobjectstorage.*region*.oraclecloud.com/v1/*object_storage_namespace*. For example:

```
ALTER DATABASE PROPERTY SET default_bucket='https://swiftobjectstorage.us-phoenix-
1.oraclecloud.com/v1/ansh8lvru1zp';
```

In the example, the Object Storage namespace is **ansh8lvru1zp**.

Tip

- To determine the Object Storage namespace string to use, click **View Bucket** in the actions (three dots) menu of the bucket you created in the previous step.
- Do not include the bucket name in the URL.
- Ensure that you follow the format indicated. Do not use a pre-authenticated request URL.

4. With the tenancy user and the auth token referenced in step 1, create the credential for your Oracle Cloud Infrastructure Object Storage account. Use `DBMS_CLOUD.CREATE_CREDENTIAL` to create the credential.

   For example:

   ```
   BEGIN
   DBMS_CLOUD.CREATE_CREDENTIAL(
   credential_name => 'DEF_CRED_NAME',
   username => 'db1_user@oracle.com',
   password => '<auth_token>'
   );
   END;
   /
   ```

   For more information on creating this credential, see CREATE_CREDENTIAL Procedure.

5. Set the database property `default_credential` to the credential you created in the previous step.

   For example:

   ```
   ALTER DATABASE PROPERTY SET default_credential = 'ADMIN.DEF_CRED_NAME';
   ```

To list the current value for the default bucket, run the following command:

```
SELECT PROPERTY_VALUE from database_properties WHERE PROPERTY_NAME='DEFAULT_BUCKET';
```

After completing these steps you can take manual backups any time you want.

Restoring an Autonomous Database

This topic describes how to restore an Autonomous Database from a backup. You can use the Oracle Cloud Infrastructure Console or the API to perform this task.

You can use any existing manual or automatic backup to restore your database, or you can restore and recover your database to any point in time in the 60-day retention period of your automatic backups. For point-in-time restores, you specify a timestamp, and your Autonomous Database decides which backup to use for the fastest restore.

Note

Restoring Autonomous Database puts the database in the unavailable state during the restore operation. You cannot connect to a database in that state. The only lifecycle management operation supported in the unavailable state is terminate.

Prerequisites

To restore Autonomous Databases, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in. See Authentication and Authorization for more information on user authorizations for the Oracle Cloud Infrastructure Database service. See Let database admins manage Autonomous Databases for sample Autonomous Database policies. See Details for the Database Service for detailed information on policy syntax.

Using the Oracle Cloud Infrastructure Console

To restore an Autonomous Database from a backup

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, find the database that you wish to restore.
4. Click the name of the Autonomous Database to display the database details.
5. Click the **Restore** button to open the restore dialog.
6. Click **Select Backup**.
7. Specify the date range for a list of backups to display.
8. Select the backup.
9. Click **Restore**.

To restore an Autonomous Database using point-in-time restore

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, find the database that you wish to restore.
4. Click the name of the Autonomous Database to display the database details.
5. Click the **Restore** button to open the restore dialog.
6. Click **Specify Timestamp**.
7. Enter a timestamp. Your Autonomous Database decides which backup to use for faster recovery. The timestamp input allows you to specify precision to the seconds level (YYYY-MM-DD HH:MM:SS GMT).

8. Click **Restore**.

Using the API

Use the RestoreAutonomousDatabase API operation to restore your Autonomous Database from a backup.

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Cloning an Autonomous Database

This topic describes how to clone an existing Autonomous Database using the Oracle Cloud Infrastructure Console or the API. You may wish to use the cloning feature to create a point-in-time copy of your Autonomous Database for purposes such as testing, development or analytics. If you need to clone only the database schema of your source database, the Console's cloning feature is a quick and easy way to accomplish this task.

Clone Types

The clone feature offers the following two types of Autonomous Database clones:

- The full clone option creates a new database that includes all of the source database's metadata and data.
- The metadata clone option creates a new database that includes the source database's metadata, but not the source database's data.

Prerequisites

- To clone an Autonomous Database, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the

type of access you've been granted and which compartment you should work in. See Authentication and Authorization for more information on user authorizations for the Oracle Cloud Infrastructure Database service.

Using the Oracle Cloud Infrastructure Console

To clone an Autonomous Database

1. Open the navigation menu. Under **Database**, click **Autonomous Transaction Processing** or **Autonomous Data Warehouse**.
2. Choose your **Compartment**.
3. In the list of Autonomous Databases, click on the display name of the database you wish to clone.
4. Hover over the **Actions** button, and then click **Create Clone**.
   In the **Create Autonomous Database Clone** dialog, enter the following:

   Clone Type

   Select the type of clone you wish to create. Choose either **Full Clone** or **Metadata Clone**.

   Database Information

   - **Compartment:**Your current compartment is the default selection.
   - **Display Name:** A user-friendly description or other information that helps you easily identify the resource. The display name does not have to be unique, and you can change it whenever you like. Avoid entering confidential information.
   - **Database Name:** The database name must consist of letters and numbers only, starting with a letter. The maximum length is 14 characters. Avoid entering confidential information.
   - **CPU Core Count:** You can enable up to 128 cores for your Autonomous Database. The actual number of available cores is subject to your tenancy's service limits.

- **Storage:** Specify the storage you wish to make available to your Autonomous Database database, in terabytes. You can make up to 128 TB available. For full clones, the size of the source database determines the minimum amount of storage you can make available.

ADMINISTRATOR CREDENTIAL

Set the password for the Autonomous Database Admin user by entering a password that meets the following criteria. You use this password when accessing the Autonomous Database service console and when using an SQL client tool.

- Between 12 and 30 characters long
- Contains at least one lowercase letter
- Contains at least one uppercase letter
- Contains at least one number
- Does not contain the double quotation mark (")
- Does not contain the string "admin", regardless of casing

LICENSE TYPE

The type of license you want to use for the Autonomous Transaction Processing database. Your choice affects metering for billing. You have the following options:

- **My Organization Already Owns Oracle Database Software Licenses**: This choice is used for the Bring Your Own License (BYOL) license type. If you choose this option, make sure you have proper entitlements to use for new service instances that you create.
- **Subscribe to New Database Software Licenses and the Database Cloud Service**: This is used for the License Included license type. With this choice, the cost of the cloud service includes a license for the Database service.

5. Click **Create Autonomous Database Clone**.

The Console displays the details page for the new clone of your database and the service begins provisioning the Autonomous Database. Note the following:

- The new clone displays the **Provisioning** lifecycle state until the provisioning process completes.
- The source database remains in the **Available** lifecycle state.
- Backups associated with the source database are not cloned for either the full clone or the metadata clone option.
- Oracle recommends that you evaluate the security requirements for the new database and implement them, as applicable. See Security Considerations for details.

Using the API

Use the CreateAutonomousDatabase API operation to clone an Autonomous Database.

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

For More Information

For information about optimizer statistics, resource management rules and performance data for a cloned database, see the Using Oracle Autonomous Data Warehouse and Using Oracle Autonomous Transaction Processing user guides.

Migrating Databases to the Cloud

You can migrate your on-premises Oracle Database to an Oracle Cloud Infrastructure Database service database using a number of different methods that use several different tools. The method that applies to a given migration scenario depends on several factors, including the version, character set, and platform endian format of the source and target databases.

Choosing a Migration Method

Not all migration methods apply to all migration scenarios. Many of the migration methods apply only if specific characteristics of the source and destination databases match or are

compatible. Moreover, additional factors can affect which method you choose for your migration from among the methods that are technically applicable to your migration scenario.

Some of the characteristics and factors to consider when choosing a migration method are:

- On-premises database version
- Database service database version
- On-premises host operating system and version
- On-premises database character set
- Quantity of data, including indexes
- Data types used in the on-premises database
- Storage for data staging
- Acceptable length of system outage
- Network bandwidth

To determine which migration methods are applicable to your migration scenario, gather the following information.

1. Database version of your on-premises database:
    - Oracle Database 12c Release 2 version 12.2.0.1
    - Oracle Database 12c Release 1 version 12.1.0.2 or higher
    - Oracle Database 12c Release 1 version lower than 12.1.0.2
    - Oracle Database 11g Release 2 version 11.2.0.3 or higher
    - Oracle Database 11g Release 2 version lower than 11.2.0.3
2. For on-premises Oracle Database 12c Release 2 and Oracle Database 12c Release 1 databases, the architecture of the database:
    - Multitenant container database (CDB)
    - Non-CDB
3. Endian format (byte ordering) of your on-premises database's host platform

Some platforms are little endian and others are big endian. Query V$TRANSPORTABLE_PLATFORM to identify the endian format, and to determine whether cross-platform tablespace transport is supported.

The Oracle Cloud Infrastructure Database uses the Linux platform, which is little endian.

4. Database character set of your on-premises database and the Oracle Cloud Infrastructure Database database.

   Some migration methods require that the source and target databases use compatible database character sets.

5. Database version of the Oracle Cloud Infrastructure Database database you are migrating to:

   - Oracle Database 12c Release 2
   - Oracle Database 12c Release 1
   - Oracle Database 11g Release 2

   Oracle Database 12c Release 2 and Oracle Database 12c Release 1 databases created on the Database service use CDB architecture. Databases created using the Enterprise Edition software edition are single-tenant, and databases created using the High Performance or Extreme Performance software editions are multitenant.

After gathering this information, use the "source" and "destination" database versions as your guide to see which migration methods apply to your migration scenario:

- Migrating from Oracle Database 11g to Oracle Database 11g in the Cloud
- Migrating from Oracle Database 11g to Oracle Database 12c in the Cloud
- Migrating from Oracle Database 12c CDB to Oracle Database 12c in the Cloud
- Migrating from Oracle Database 12c Non-CDB to Oracle Database 12c in the Cloud

Migration Connectivity Options

You have several connectivity options when migrating your on-premises databases to the Oracle Cloud Infrastructure. The options are listed below in order of preference.

1. **FastConnect:** Provides a secure connection between your existing network and your virtual cloud network (VCN) over a private physical network instead of the internet. For more information, see FastConnect.
2. **IPSec VPN:** Provides a secure connection between a dynamic routing gateway (DRG) and customer-premise equipment (CPE), consisting of multiple IPSec tunnels. The IPSec connection is one of the components forming a site-to-site VPN between a VCN and your on-premises network. For more information, see VPN Connect.
3. **Internet gateway:** Provides a path for network traffic between your VCN and the internet. For more information, see Internet Gateway.

Migration Methods

Many methods exist to migrate Oracle databases to the Oracle Cloud Infrastructure Database service. Which of these methods apply to a given migration scenario depends on several factors, including the version, character set, and platform endian format of the source and target databases.

- Data Pump Conventional Export/Import
- Data Pump Full Transportable
- Data Pump Transportable Tablespace
- Remote Cloning a PDB
- Remote Cloning Non-CDB
- RMAN Cross-Platform Transportable PDB
- RMAN Cross-Platform Transportable Tablespace Backup Sets
- RMAN Transportable Tablespace with Data Pump
- RMAN DUPLICATE from an Active Database
- RMAN CONVERT Transportable Tablespace with Data Pump
- SQL Developer and INSERT Statements to Migrate Selected Objects
- SQL Developer and SQL*Loader to Migrate Selected Objects

- Unplugging/Plugging a PDB
- Unplugging/Plugging Non-CDB

Migrating an On-Premises Database to Oracle Cloud Infrastructure by Creating a Backup in the Cloud

Note

This topic is not applicable to Exadata DB systems.

You can migrate an on-premises database to Oracle Cloud Infrastructure by creating a backup of your on-premises database in Oracle Cloud Infrastructure's Database service.

Oracle provides a Python script to create a backup of your database. The script invokes an API call to create the backup and then places the backup in Oracle Cloud Infrastructure. You can then use the Console or the API to create a new database or DB system from that backup. Backups created using the instructions in this topic appear under Standalone Backups in the console.

The Python script is bundled as a part of the Oracle Cloud Infrastructure CLI installation. Oracle provides the migration script and associated files at no cost. Normal Object Storage charges apply for the storage of your backup in Oracle Cloud Infrastructure.

Compatibility

The scripted migration process is compatible with the following bare metal and virtual machine DB system configurations:

Configuration	Version or Type	Notes
Database Version	18.x 12.2.0.1 12.1.0.2 11.2.0.4	• For versions 18c, 12.2.0.1, and 12.1.0.2: ◦ Only Container Databases (CDBs) are supported. The scripted migration process may work with non-CDB databases for these database versions, but Oracle does not provide support for the migration of non-CDB databases using the script described in this topic. For information on creating an on-premises pluggable database (PDB) by cloning a non-CDB in Oracle Database 18c, see About Cloning a Non-CDB. For an overview of multitenant architecture in Oracle Database 18c, see Introduction to the Multitenant Architecture. For information on creating an on-premises pluggable database (PDB) from a non-CDB database in Oracle Database 12c Release 2 (12.2), see Upgrading a Non-CDB Oracle Database To a PDB on a CDB. For an overview of multitenant architecture in 12c Release 2, see Overview of Managing a Multitenant Environment. ◦ The Oracle Cloud Infrastructure Database service will attempt to run datapatch, which requires read/write mode. If there are pluggable databases (PDBs), they should also be in read/write mode to ensure that datapatch runs on them. • For version 11.2.0.4, depending on the source

Configuration	Version or Type	Notes
		database patch level, you may need to roll back patches prior to migrating. See Rolling Back Patches on a Version 11.2 Database for more information. • If your on-premises database has an interim patch (previous known as a one-off patch), see Applying Interim Patches for details on applying the patch in Oracle Cloud Infrastructure.
Source Database Platform	Oracle Enterprise Linux / Red Hat Enterprise Linux 5.x Oracle Linux / Red Hat Enterprise Linux 6.x Oracle Linux / Red Hat Enterprise 7.x	• The scripted migration described in this topic may work in Microsoft Windows environments, but Oracle currently does not provide support for this script in Windows. • For Oracle Linux 6.x users, see Configuring Oracle Linux 6 to install Python for details on configuring the operating system to install a compatible version of Python. See Installing the CLI for more information regarding Oracle Linux 6.
Encryption	TDE Non-TDE	• In a non-TDE configuration, the RMAN encryption password is required. • Unencrypted on-premises databases remain unencrypted when restored to Oracle Cloud Infrastructure. The stored RMAN standalone backups are always encrypted.

Configuration	Version or Type	Notes
Target Database Edition	Standard Edition Enterprise Edition Enterprise Edition - High Performance Enterprise Edition - Extreme Performance	
Cluster	Single RAC	

Prerequisites

On the source database host:

- Outbound internet connectivity for installing Python packages, running yum install, and access to the Oracle Cloud Infrastructure API and Object Storage.
- RMAN configuration to autobackup `controlfile` and `spfile`:

```
RMAN> CONFIGURE CONTROLFILE AUTOBACKUP ON;
```

Note

RMAN configuration changes must be completed prior to running the script. The script may modify RMAN parameters as required to complete the backup and migration tasks.

To Migrate an On-Premises Database Using a Standalone Backup

Perform the following tasks on the source database host:

1. Create a directory named `/home/oracle/migrate`.

Tip

You can name the `migrate` portion of the directory path anything you want. If you use a different name, you must adjust all of the paths that appear in this task accordingly. The following examples assume the name `migrate` for simplicity and clarity.

2. As *root*, run the CLI installer in the directory you created in step 1. (For example, `/home/oracle/migrate`.) See Installing the CLI: Windows for instructions on running the installer script in Windows. See Installing the CLI: MacOS, Linux, and Unix for instructions on running the installer script in the Bash environment.

   The installer installs Python 3.6.0 if either Python 2.7 or Python 3.6 does not exist on the machine. The installer also installs the Python script required to create and migrate a standalone backup from an on-premises database.

   On Oracle Linux 6, a newer version of Python (such as Python 3.6.0) is usually required. **Use the following instructions to configure Oracle Linux 6 before running the backup script.**

Configuring Oracle Linux 6 to install Python

In Oracle Linux 6 use the following `/etc/yum.repos.d/ol6.repo` file to ensure that a compatible version of Python is installed by the script if a compatible version is not already installed. Include this file before attempting to run the script with the `./install.sh` command.

```
[ol6_latest]
name=Oracle Linux $releasever Latest ($basearch)
baseurl=http://yum.oracle.com/repo/OracleLinux/OL6/latest/$basearch/
gpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-KEY-oracle
gpgcheck=1
enabled=1
```

3. Copy the following files into the new directory:
   - Oracle Database Backup Module (`opc_install.jar`)
   - Your API `*.pem` key file.
4. Respond to the prompts as follows:

```
(yum install)
Is this ok [y/N]: y

===> Missing native dependencies. Continue and install the following dependencies: gcc, libffi-
devel, python36u-devel, openssl-devel? (Y/n): Y

===> In what directory would you like to place the install? (leave blank to use
'/root/lib/oracle-cli'): /home/oracle/migrate/lib/oracle-cli

===> In what directory would you like to place the 'oci' executable? (leave blank to use
'/root/bin'): /home/oracle/migrate/bin

===> In what directory would you like to place the OCI scripts? (leave blank to use
'/root/bin/oci-cli-scripts'): /home/oracle/migrate/bin/oci-cli-scripts

===> Currently supported optional packages are: ['db (will install cx_Oracle)'] What optional CLI
packages would you like to be installed (comma separated names; press enter if you don't need any
optional packages)?: db
```

```
===> Modify profile to update your $PATH and enable shell/tab completion now? (Y/n): Y

===> Enter a path to an rc file to update (leave blank to use '/root/.bashrc'):
/home/oracle/.bashrc
```

5. Perform the following file operations:

```
# chown -R oracle:oinstall /home/oracle/migrate
```

6. Edit the `/home/oracle/migrate/config.txt` file

```
[DEFAULT]
tenancy=<your_tenancy_OCID>
user=<your_user_OCID>
fingerprint=<fingerprint>
key_file=/home/oracle/migrate/<your_api_key>.pem
region=<region>
```

If you do not know your API signing key's fingerprint, see How to Get the Key's Fingerprint.

7. As *oracle user* (not *root*), run one of the following sets of commands, depending on the type of database you are migrating.

For a non-TDE database:

```
export AD=<destination_availability_domain>
export C=<destination_compartment_OCID>
export ORACLE_SID=<ORACLE_SID>
export ORACLE_HOME=<ORACLE_HOME>
export PATH=$PATH:$ORACLE_HOME/bin
export LC_ALL=en_US.UTF-8
export ORACLE_UNQNAME=<source_DB_unique_name>
rm -rf /home/oracle/migrate/onprem_upload
cd /home/oracle/migrate/bin/oci-cli-scripts/
./create_backup_from_onprem --config-file /home/oracle/migrate/config.txt --display-name
<example_display_name> --availability-domain $AD --edition ENTERPRISE_EDITION_EXTREME_PERFORMANCE
--opc-installer-dir /home/oracle/migrate --tmp-dir /home/oracle/migrate/onprem_upload --
compartment-id $C --rman-password <password>
```

For a TDE-enabled database:

```
export AD=<destination_availability_domain>
export C=<destination_compartment_OCID>
export ORACLE_SID=<ORACLE_SID>
```

```
export ORACLE_HOME=<ORACLE_HOME>
export PATH=$PATH:$ORACLE_HOME/bin
rm -rf /home/oracle/migrate/onprem_upload
cd /home/oracle/migrate/bin/oci-cli-scripts/
./create_backup_from_onprem --config-file /home/oracle/migrate/config.txt --display-name
<example_display_name> --availability-domain $AD --edition ENTERPRISE_EDITION_EXTREME_PERFORMANCE
--opc-installer-dir /home/oracle/migrate --tmp-dir /home/oracle/migrate/onprem_upload --
compartment-id $C
```

See the following list of parameters used by the script for more details.

Parameters used by the script

Parameter	Description	Required
`--config-file`	The path to the oci-cli config file. The default path is as follows: `~/.oci/config`	No
`--profile`	The profile in the config file to load. This profile will also be used to locate any default parameter values which have been specified in the OCI CLI-specific configuration file. The default value is `DEFAULT`.	No
`--compartment-id`	The compartment OCID of the Oracle Cloud Infrastructure compartment that will contain your standalone backup.	Yes
`--display-name`	The name of the backup, as you wish it to be displayed in the OCI Console under Standalone Backups.	Yes
`--availability-domain`	The availability domain where the backup is to be stored.	Yes

Parameter	Description	Required
`--edition`	The edition of the Oracle Cloud Infrastructure DB system that will contain the database created from the standalone backup. You can choose the same edition as the on-premises database, or any addition above the on-premises database. The choices, listed from lowest to highest, are the following: • STANDARD_EDITION • ENTERPRISE_EDITION • ENTERPRISE_EDITION_HIGH_PERFORMANCE • ENTERPRISE_EDITION_EXTREME_PERFORMANCE	Yes
`--opc-installer-dir`	The directory containing the `opc_installer.jar` file. This is the directory you created in step 1 of this procedure.	Yes
`--additional-opc-args`	Optional additional arguments for the opc installer.	No
`--tmp-dir`	Optional temporary directory for intermediate files.	No
`--rman-password`	The RMAN password to use for the standalone backup.	Required if TDE is not enabled

Parameter	Description	Required
`--rman-channels`	RMAN channels. The default value is 5.	No
`--help`	Displays in-line help for the script in the OCI-CLI environment.	No

The script will produce a standalone backup of your on-premises database in your Oracle Cloud Infrastructure tenancy. You can check the Console for your backup by viewing the **Standalone Backups** page in the Database service, under **Bare Metal, VM, and Exadata**.

Tip

To access command line help for the backup script, run the following command in the /home/oracle/migrate/bin/oci-cli-scripts/ directory:

```
create_backup_from_onprem --help
```

8. Create a new database or launch a new DB system using the backup you created in the preceding step. See the following instructions to perform these tasks:
   - Recovering a Database from Object Storage
   - Recovering a Database from Object Storage

Migrating from Oracle Database 11g to Oracle Database 11g in the Cloud

You can migrate Oracle Database 11g databases from on-premises to Oracle Database 11g databases in the Database service using several different methods.

The applicability of some of the migration methods depends on the on-premises database's character set and platform endian format.

If you have not already done so, determine the database character set of your on-premises database, and determine the endian format of the platform your on-premises database resides on. Use this information to help you choose an appropriate method.

- Data Pump Conventional Export/Import
  This method can be used regardless of the endian format and database character set of the on-premises database.
  For the steps this method entails, see Data Pump Conventional Export/Import.
- Data Pump Transportable Tablespace
  This method can be used only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Oracle Cloud Infrastructure Database database are compatible.
  For the steps this method entails, see Data Pump Transportable Tablespace.
- RMAN Transportable Tablespace with Data Pump
  This method can be used only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Oracle Cloud Infrastructure Database database are compatible.
  For the steps this method entails, see RMAN Transportable Tablespace with Data Pump.
- RMAN `CONVERT` Transportable Tablespace with Data Pump
  This method can be used only if the database character sets of your on-premises database and the Oracle Cloud Infrastructure Database database are compatible.
  This method is similar to the Data Pump Transportable Tablespace method, with the addition of the RMAN `CONVERT` command to enable transport between platforms with different endianness. Query `V$TRANSPORTABLE_PLATFORM` to determine if the on-premises database platform supports cross-platform tablespace transport and to determine the endian format of the platform. The Database service platform is little-endian format.
  For the steps this method entails, see RMAN CONVERT Transportable Tablespace with Data Pump.

Migrating from Oracle Database 11g to Oracle Database 12c in the Cloud

You can migrate Oracle Database 11g databases from on-premises to Oracle Database 12c databases in the Database service using several different methods.

The applicability of some of the migration methods depends on the on-premises database's version, database character set and platform endian format.

If you have not already done so, determine the database version and database character set of your on-premises database, and determine the endian format of the platform your on-premises database resides on. Use this information to help you choose an appropriate method.

- Data Pump Conventional Export/Import
  This method can be used regardless of the endian format and database character set of the on-premises database.
  For the steps this method entails, see Data Pump Conventional Export/Import.
- Data Pump Transportable Tablespace
  This method can be used only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Databaseservice database are compatible.
  For the steps this method entails, see Data Pump Transportable Tablespace.
- RMAN Transportable Tablespace with Data Pump
  This method can be used only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Database service database are compatible.
  For the steps this method entails, see RMAN Transportable Tablespace with Data Pump.
- RMAN `CONVERT` Transportable Tablespace with Data Pump
  This method can be used only if the database character sets of your on-premises database and the Database service database are compatible.
  This method is similar to the Data Pump Transportable Tablespace method, with the addition of the RMAN `CONVERT` command to enable transport between platforms with different endianness. Query `V$TRANSPORTABLE_PLATFORM` to determine if the on-

premises database platform supports cross-platform tablespace transport and to determine the endian format of the platform. The Database service platform is little-endian format.

For the steps this method entails, see RMAN CONVERT Transportable Tablespace with Data Pump.

- Data Pump Full Transportable

  This method can be used only if the source database release version is 11.2.0.3 or later, and the database character sets of your on-premises database and the Database service database are compatible.

  For the steps this method entails, see Data Pump Full Transportable.

Migrating from Oracle Database 12c CDB to Oracle Database 12c in the Cloud

You can migrate Oracle Database 12c CDB databases from on-premises to Oracle Database 12c databases in the Oracle Cloud Infrastructure Database service using several different methods.

The applicability of some of the migration methods depends on the on-premises database's character set and platform endian format.

If you have not already done so, determine the database character set of your on-premises database, and determine the endian format of the platform your on-premises database resides on. Use this information to help you choose an appropriate method.

- Data Pump Conventional Export/Import

  This method can be used regardless of the endian format and database character set of the on-premises database.

  For the steps this method entails, see Data Pump Conventional Export/Import.

- Data Pump Transportable Tablespace

  This method can be used only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Database database are compatible.

For the steps this method entails, see Data Pump Transportable Tablespace.

- RMAN Transportable Tablespace with Data Pump
  This method can be used only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Oracle Cloud Infrastructure Database service database are compatible.
  For the steps this method entails, see RMAN Transportable Tablespace with Data Pump.
- RMAN `CONVERT` Transportable Tablespace with Data Pump
  This method can be used only if the database character sets of your on-premises database and the Database database are compatible.
  This method is similar to the Data Pump Transportable Tablespace method, with the addition of the RMAN `CONVERT` command to enable transport between platforms with different endianness. Query `V$TRANSPORTABLE_PLATFORM` to determine if the on-premises database platform supports cross-platform tablespace transport and to determine the endian format of the platform. The Database service platform is little-endian format.
  For the steps this method entails, see RMAN CONVERT Transportable Tablespace with Data Pump.
- RMAN Cross-Platform Transportable Tablespace Backup Sets
  This method can be used only if the database character sets of your on-premises database and the Database service database are compatible.
  For the steps this method entails, see RMAN Cross-Platform Transportable Tablespace Backup Sets.
- Data Pump Full Transportable
  This method can be used only if the database character sets of your on-premises database and the Database service database are compatible.
  For the steps this method entails, see Data Pump Full Transportable.
- Unplugging/Plugging (CDB)
  This method can be used only if the on-premises platform is little endian, and the on-premises database and Database database have compatible database character sets and national character sets.

For the steps this method entails, see Unplugging/Plugging a PDB.

- Remote Cloning (CDB)
  This method can be used only if the on-premises platform is little endian, the on-premises database release is 12.1.0.2 or higher, and the on-premises database and Database service database have compatible database character sets and national character sets.
  For the steps this method entails, see Remote Cloning a PDB.
- RMAN Cross-Platform Transportable PDB
  This method can be used only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Database service database are compatible.
  For the steps this method entails, see RMAN Cross-Platform Transportable PDB.
- SQL Developer and SQL*Loader to Migrate Selected Objects
  You can use SQL Developer to create a cart into which you add selected objects to be loaded into your Oracle Database 12c database on the cloud. In this method, you use SQL*Loader to load the data into your cloud database.
  For the steps this method entails, see SQL Developer and SQL*Loader to Migrate Selected Objects.
- SQL Developer and `INSERT` Statements to Migrate Selected Objects
  You can use SQL Developer to create a cart into which you add selected objects to be loaded into your Oracle Database 12c database on the cloud. In this method, you use SQL `INSERT` statements to load the data into your cloud database.
  For the steps this method entails, see SQL Developer and INSERT Statements to Migrate Selected Objects.

Migrating from Oracle Database 12c Non-CDB to Oracle Database 12c in the Cloud

You can migrate Oracle Database 12c non-CDB databases from on-premises to Oracle Database 12c databases in Oracle Cloud Infrastructure Database service using several different methods.

The applicability of some of the migration methods depends on the on-premises database's character set and platform endian format.

If you have not already done so, determine the database character set of your on-premises database, and determine the endian format of the platform your on-premises database resides on. Use this information to help you choose an appropriate method.

- Data Pump Conventional Export/Import
  This method can be used regardless of the endian format and database character set of the on-premises database.
  For the steps this method entails, see Data Pump Conventional Export/Import.
- Data Pump Transportable Tablespace
  This method can be used only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Database database are compatible.
  For the steps this method entails, see Data Pump Transportable Tablespace.
- RMAN Transportable Tablespace with Data Pump
  This method can be used only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Database service database are compatible.
  For the steps this method entails, see RMAN Transportable Tablespace with Data Pump.
- RMAN `CONVERT` Transportable Tablespace with Data Pump
  This method can be used only if the database character sets of your on-premises database and the Database service database are compatible.
  This method is similar to the Data Pump Transportable Tablespace method, with the addition of the RMAN `CONVERT` command to enable transport between platforms with different endianness. Query `V$TRANSPORTABLE_PLATFORM` to determine if the on-premises database platform supports cross-platform tablespace transport and to determine the endian format of the platform. The Database service platform is little-endian format.
  For the steps this method entails, see RMAN CONVERT Transportable Tablespace with Data Pump.

- RMAN Cross-Platform Transportable Tablespace Backup Sets
  This method can be used only if the database character sets of your on-premises database and the Database database are compatible.
  For the steps this method entails, see RMAN Cross-Platform Transportable Tablespace Backup Sets.
- Data Pump Full Transportable
  This method can be used only if the database character sets of your on-premises database and the Database service database are compatible.
  For the steps this method entails, see Data Pump Full Transportable.
- Unplugging/Plugging (non-CDB)
  This method can be used only if the on-premises platform is little endian, and the on-premises database and Database service database have compatible database character sets and national character sets.
  You can use the unplug/plug method to migrate an Oracle Database 12c non-CDB database to Oracle Database 12c in the cloud. This method provides a way to consolidate several non-CDB databases into a single Oracle Database 12c CDB on the cloud.
  For the steps this method entails, see Unplugging/Plugging Non-CDB.
- Remote Cloning (non-CDB)
  This method can be used only if the on-premises platform is little endian, the on-premises database release is 12.1.0.2 or higher, and the on-premises database and Database service database have compatible database character sets and national character sets.
  You can use the remote cloning method to copy an Oracle Database 12c non-CDB on-premises database to your Oracle Database 12c database in the cloud.
  For the steps this method entails, see Remote Cloning Non-CDB.
- SQL Developer and SQL*Loader to Migrate Selected Objects
  You can use SQL Developer to create a cart into which you add selected objects to be loaded into your Oracle Database 12c database on the cloud. In this method, you use SQL*Loader to load the data into your cloud database.

For the steps this method entails, see SQL Developer and SQL*Loader to Migrate Selected Objects.

- SQL Developer and `INSERT` Statements to Migrate Selected Objects
  You can use SQL Developer to create a cart into which you add selected objects to be loaded into your Oracle Database 12c database on the cloud. In this method, you use SQL `INSERT` statements to load the data into your cloud database.
  For the steps this method entails, see SQL Developer and INSERT Statements to Migrate Selected Objects.

Data Pump Conventional Export/Import

You can use this method regardless of the endian format and database character set of the on-premises database.

To migrate an on-premises source database, tablespace, schema, or table to the database on a Database service database deployment using Data Pump Export and Import, you perform these tasks:

1. On the on-premises database host, invoke Data Pump Export and export the on-premises database.
2. Use a secure copy utility to transfer the dump file to the Database service compute node.
3. On the Database service compute node, invoke Data Pump Import and import the data into the database.
4. After verifying that the data has been imported successfully, you can delete the dump file.

For information about Data Pump Import and Export, see these topics:

- "Data Pump Export Modes" in *Oracle Database Utilities* for Release 12.2, 12.1 or 11.2.
- "Data Pump Import Modes" in *Oracle Database Utilities* for Release 12.2, 12.1 or 11.2.

Data Pump Conventional Export/Import: Example

This example provides a step-by-step demonstration of the tasks required to migrate a schema from an on-premises Oracle database to a Database service database.

This example illustrates a schema mode export and import. The same general procedure applies for a full database, tablespace, or table export and import.

In this example, the on-premises database is on a Linux host.

1. On the on-premises database host, invoke Data Pump Export to export the schemas.
    a. On the on-premises database host, create an operating system directory to use for the on-premises database export files.

    ```
    $ mkdir /u01/app/oracle/admin/orcl/dpdump/for_cloud
    ```

    b. On the on-premises database host, invoke SQL*Plus and log in to the on-premises database as the `SYSTEM` user.

    ```
    $ sqlplus system
    Enter password: <enter the password for the SYSTEM user>
    ```

    c. Create a directory object in the on-premises database to reference the operating system directory.

    ```
    SQL> CREATE DIRECTORY dp_for_cloud AS '/u01/app/oracle/admin/orcl/dpdump/for_cloud';
    ```

    d. Exit from SQL*Plus.
    e. On the on-premises database host, invoke Data Pump Export as the `SYSTEM` user or another user with the `DATAPUMP_EXP_FULL_DATABASE` role and export the on-premises schemas. Provide the password for the user when prompted.

    ```
    $ expdp system SCHEMAS=fsowner DIRECTORY=dp_for_cloud
    ```

2. Use a secure copy utility to transfer the dump file to the Database service compute node.
    In this example the dump file is copied to the `/u01` directory. Choose the appropriate location based on the size of the file that will be transferred.

a. On the Database service compute node, create a directory for the dump file.

```
$ mkdir /u01/app/oracle/admin/ORCL/dpdump/from_onprem
```

b. Before using the `scp` command to copy the export dump file, make sure the SSH private key that provides access to the Database service compute node is available on your on-premises host.

c. On the on-premises database host, use the SCP utility to transfer the dump file to the Databaseservice compute node.

```
$ scp –i private_key_file \
/u01/app/oracle/admin/orcl/dpdump/for_cloud/expdat.dmp \
oracle@IP_address_DBaaS_VM:/u01/app/oracle/admin/ORCL/dpdump/from_onprem
```

3. On the Database service compute node, invoke Data Pump Import and import the data into the database.

a. On the Database service compute node, invoke SQL*Plus and log in to the database as the `SYSTEM` user.

```
$ sqlplus system
Enter password: <enter the password for the SYSTEM user>
```

b. Create a directory object in the Database service database.

```
SQL> CREATE DIRECTORY dp_from_onprem AS '/u01/app/oracle/admin/ORCL/dpdump/from_onprem';
```

c. If they do not exist, create the tablespace(s) for the objects that will be imported.

d. Exit from SQL*Plus.

e. On the Database service compute node, invoke Data Pump Import and connect to the database. Import the data into the database.

```
impdp system SCHEMAS=fsowner DIRECTORY=dp_from_onprem
```

4. After verifying that the data has been imported successfully, you can delete the `expdat.dmp` file.

Data Pump Full Transportable

You can use this method only if the source database release version is 11.2.0.3 or later, and the database character sets of your on-premises database and the Oracle Cloud Infrastructure

Database service database are compatible.

You can use the Data Pump full transportable method to copy an entire database from your on-premises host to the database on a Database service database deployment.

To migrate an Oracle Database 11g on-premises database to the Oracle Database 12c database on a Database service database deployment using the Data Pump full transportable method, you perform these tasks:

1. On the on-premises database host, prepare the database for the Data Pump full transportable export by placing the user-defined tablespaces in `READ ONLY` mode.
2. On the on-premises database host, invoke Data Pump Export to perform the full transportable export.
3. Use a secure copy utility to transfer the Data Pump Export dump file and the datafiles for all of the user-defined tablespaces to the Database service compute node.
4. Set the on-premises tablespaces back to `READ WRITE`.
5. On the Database service compute node, prepare the database for the tablespace import.
6. On the Database service compute node, invoke Data Pump Import and connect to the database.
7. After verifying that the data has been imported successfully, you can delete the dump file.

Data Pump Full Transportable: Example

This example provides a step-by-step demonstration of the tasks required to migrate an Oracle Database 11g database to a Database service 12c database.

In this example, the source database is on a Linux host.

1. On the source database host, prepare the database for the Data Pump full transportable export.
    a. On the source database host, create a directory in the operating system to use for the source export.

```
$ mkdir /u01/app/oracle/admin/orcl/dpdump/for_cloud
```

b. On the source database host, invoke SQL*Plus and log in to the source database as the `SYSTEM` user.

```
$ sqlplus system
Enter password: <enter the password for the SYSTEM user>
```

c. Create a directory object in the source database to reference the operating system directory.

```
SQL> CREATE DIRECTORY dp_for_cloud AS '/u01/app/oracle/admin/orcl/dpdump/for_cloud';
```

d. Determine the name(s) of the tablespaces and data files that belong to the user-defined tablespaces by querying `DBA_DATA_FILES`. These files will also be listed in the export output.

```
SQL> SELECT tablespace_name, file_name FROM dba_data_files;
TABLESPACE_NAME  FILE_NAME
---------------  --------------------------------------------------
USERS            /u01/app/oracle/oradata/orcl/users01.dbf
UNDOTBS1         /u01/app/oracle/oradata/orcl/undotbs01.dbf
SYSAUX           /u01/app/oracle/oradata/orcl/sysaux01.dbf
SYSTEM           /u01/app/oracle/oradata/orcl/system01.dbf
EXAMPLE          /u01/app/oracle/oradata/orcl/example01.dbf
FSDATA           /u01/app/oracle/oradata/orcl/fsdata01.dbf
FSINDEX          /u01/app/oracle/oradata/orcl/fsindex01.dbf
SQL>
```

e. On the source database host, set all tablespaces that will be transported (the transportable set) to `READ ONLY` mode.

```
SQL> ALTER TABLESPACE example READ ONLY;
Tablespace altered.
SQL> ALTER TABLESPACE fsindex READ ONLY;
Tablespace altered.
SQL> ALTER TABLESPACE fsdata READ ONLY;
Tablespace altered.
SQL> ALTER TABLESPACE users READ ONLY;
Tablespace altered.
SQL>
```

f. Exit from SQL*Plus.

2. On the source database host, invoke Data Pump Export to perform the full transportable export. Specify `FULL=y` and `TRANSPORTABLE=always`. Because this is an Oracle Database 11g database and full transportable is an Oracle Database 12c feature, specify `VERSION=12`. Provide the password for the `SYSTEM` user when prompted.

```
$ expdp system FULL=y TRANSPORTABLE=always VERSION=12 DUMPFILE=expdat.dmp DIRECTORY=dp_for_cloud
```

3. Use a secure copy utility to transfer the Data Pump Export dump file and the datafiles for all of the user-defined tablespaces to the Database service compute node.
   In this example the dump file is copied to the `/u01` directory. Choose the appropriate location based on the size of the file that will be transferred.

   a. On the Database service compute node, create a directory for the dump file.

```
$ mkdir /u01/app/oracle/admin/ORCL/dpdump/from_source
```

   b. Before using the `scp` utility to copy files, make sure the SSH private key that provides access to the Database service compute node is available on your source host.

   c. On the source database host, use the `scp` utility to transfer the dump file and all datafiles of the transportable set to the Database service compute node.

```
$ scp -i private_key_file \
/u01/app/oracle/admin/orcl/dpdump/for_cloud/expdat.dmp \
oracle@compute_node_IP_address:/u01/app/oracle/admin/ORCL/dpdump/from_source

$ scp -i private_key_file \
/u01/app/oracle/oradata/orcl/example01.dbf \
oracle@compute_node_IP_address:/u02/app/oracle/oradata/ORCL/PDB2

$ scp -i private_key_file \
/u01/app/oracle/oradata/orcl/fsdata01.dbf \
oracle@compute_node_IP_address:/u02/app/oracle/oradata/ORCL/PDB2

$ scp -i private_key_file \
/u01/app/oracle/oradata/orcl/fsindex01.dbf \
oracle@compute_node_IP_address:/u02/app/oracle/oradata/ORCL/PDB2
```

```
$ scp -i private_key_file \
/u01/app/oracle/oradata/orcl/users01.dbf \
oracle@compute_node_IP_address:/u02/app/oracle/oradata/ORCL/PDB2
```

4. Set the source tablespaces back to `READ WRITE`.
    a. Invoke SQL*Plus and log in as the `SYSTEM` user.
    b. Set the user-defined tablespaces back to `READ WRITE` mode.

```
SQL> ALTER TABLESPACE example READ WRITE;
Tablespace altered.
SQL> ALTER TABLESPACE fsdata READ WRITE;
Tablespace altered.
SQL> ALTER TABLESPACE fsindex READ WRITE;
Tablespace altered.
SQL> ALTER TABLESPACE users READ WRITE;
Tablespace altered.
```

    c. Exit from SQL*Plus.
5. On the Database service compute node, prepare the PDB for the tablespace import.
    a. On the Database service compute node, invoke SQL*Plus and log in to the PDB as the `SYSTEM` user.
    b. Create a directory object in the PDB.

```
SQL> CREATE DIRECTORY dp_from_source AS '/u01/app/oracle/admin/ORCL/dpdump/from_source';
```

6. On the Database service compute node, invoke Data Pump Import and connect to the PDB.

    Import the data into the database using the `TRANSPORT_DATAFILES` option.

```
$ impdp system@PDB2 FULL=y DIRECTORY=dp_from_source \
TRANSPORT_
DATAFILES='/u02/app/oracle/oradata/ORCL/PDB2/example01.dbf',\
'/u02/app/oracle/oradata/ORCL/PDB2/fsdata01.dbf',\
'/u02/app/oracle/oradata/ORCL/PDB2/fsindex01.dbf,'\
'/u02/app/oracle/oradata/ORCL/PDB2/users01.dbf'
```

7. After verifying that the data has been imported successfully, you can delete the `expdat.dmp` dump file.

Data Pump Transportable Tablespace

You can use this method only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Oracle Cloud Infrastructure Database service database are compatible.

The Transportable Tablespace method is generally much faster than a conventional export/import of the same data because the data files containing all of the actual data are simply copied to the destination location. You use Data Pump to transfer only the metadata of the tablespace objects to the new database.

To migrate an on-premises source database to the database deployment on the Database service using the Data Pump Transportable Tablespace method, you perform these tasks:

1. On the on-premises database host, prepare the database for the Data Pump transportable tablespace export.
2. On the on-premises database host, invoke Data Pump Export to perform the transportable tablespace export.
3. Use a secure copy utility to transfer the Data Pump Export dump file and the tablespace datafiles to the Database service compute node.
4. Set the on-premises tablespaces back to `READ WRITE`.
5. On the Databaseservice compute node, prepare the database for the tablespace import.
6. On the Database service compute node, invoke Data Pump Import and connect to the database.
7. Set the tablespaces on the Database service database to `READ WRITE` mode.
8. After verifying that the data has been imported successfully, you can delete the dump file.

Data Pump Transportable Tablespace: Example

This example provides a step-by-step demonstration of the tasks required to migrate tablespaces in an on-premises Oracle database to a Database service database.

This example performs a migration of the `FSDATA` and `FSINDEX` tablespaces.

In this example, the on-premises database is on a Linux host.

1. On the on-premises database host, prepare the database for the Data Pump transportable tablespace export.
    a. On the on-premises database host, create a directory in the operating system to use for the on-premises export.

```
mkdir /u01/app/oracle/admin/orcl/dpdump/for_cloud
```

    b. On the on-premises database host, invoke SQL*Plus and log in to the on-premises database as the `SYSTEM` user.

```
sqlplus system
Enter password: <enter the password for the SYSTEM user>
```

    c. Create a directory object in the on-premises database to reference the operating system directory.

```
SQL> CREATE DIRECTORY dp_for_cloud AS '/u01/app/oracle/admin/orcl/dpdump/for_cloud';
```

    d. Determine the name(s) of the datafiles that belong to the `FSDATA` and `FSINDEX` tablespaces by querying DBA_DATA_FILES. These files will also be listed in the export output.

```
SQL> SELECT file_name FROM dba_data_files
  2  WHERE tablespace_name = 'FSDATA';

FILE_NAME
----------------------------------------------------------------
/u01/app/oracle/oradata/orcl/fsdata01.dbf

SQL> SELECT file_name FROM dba_data_files
  2  WHERE tablespace_name = 'FSINDEX';

FILE_NAME
----------------------------------------------------------------
/u01/app/oracle/oradata/orcl/fsindex01.dbf
```

    e. On the on-premises database host, set all tablespaces that will be transported (the transportable set) to `READ ONLY` mode.

```
SQL> ALTER TABLESPACE fsindex READ ONLY;
Tablespace altered.
SQL> ALTER TABLESPACE fsdata READ ONLY;
Tablespace altered.
```

f. Exit from SQL*Plus.

2. On the on-premises database host, invoke Data Pump Export to perform the transportable tablespace export.

   On the on-premises database host, invoke Data Pump Export and connect to the on-premises database. Export the on-premises tablespaces using the `TRANSPORT_TABLESPACES` option. Provide the password for the `SYSTEM` user when prompted.

```
expdp system TRANSPORT_TABLESPACES=fsdata,fsindex TRANSPORT_FULL_CHECK=YES DIRECTORY=dp_for_cloud
```

3. Use a secure copy utility to transfer the Data Pump Export dump file and the tablespace datafiles to the Database service compute node.

   In this example the dump file is copied to the `/u01` directory. Choose the appropriate location based on the size of the file that will be transferred.

   a. On the Database service compute node, create a directory for the dump file.

```
mkdir /u01/app/oracle/admin/ORCL/dpdump/from_onprem
```

   b. Before using the `scp` utility to copy files, make sure the SSH private key that provides access to the Database service compute node is available on your on-premises host.

   c. On the on-premises database host, use the `scp` utility to transfer the dump file and all datafiles of the transportable set to the Database service compute node.

```
scp -i private_key_file \
/u01/app/oracle/admin/orcl/dpdump/for_cloud/expdat.dmp \
oracle@IP_address_DBaaS_VM:/u01/app/oracle/admin/ORCL/dpdump/from_onprem

$ scp -i private_key_file \/u01/app/oracle/oradata/orcl/fsdata01.dbf \
oracle@IP_address_DBaaS_VM:/u02/app/oracle/oradata/ORCL

$ scp -i private_key_file \/u01/app/oracle/oradata/orcl/fsindex01.dbf \
oracle@IP_address_DBaaS_VM:/u02/app/oracle/oradata/ORCL
```

4. Set the on-premises tablespaces back to `READ WRITE`.

a. Invoke SQL*Plus and log in as the `SYSTEM` user.

b. Set the `FSDATA` and `FSINDEX` tablespaces back to `READ WRITE` mode.

```
SQL> ALTER TABLESPACE fsdata READ WRITE;
Tablespace altered.
SQL> ALTER TABLESPACE fsindex READ WRITE;
Tablespace altered.
```

c. Exit from SQL*Plus.

5. On the Database service compute node, prepare the database for the tablespace import.

a. On the Database service compute node, invoke SQL*Plus and log in to the database as the `SYSTEM` user.

b. Create a directory object in the Database service database.

```
SQL> CREATE DIRECTORY dp_from_onprem AS '/u01/app/oracle/admin/ORCL/dpdump/from_onprem';
```

c. If the owners of the objects that will be imported do not exist in the database, create them before performing the import. The transportable tablespace mode of import does not create the users.

```
SQL> CREATE USER fsowner
  2  PROFILE default
  3  IDENTIFIED BY fspass
  4  TEMPORARY TABLESPACE temp
  5  ACCOUNT UNLOCK;
```

6. On the Database service compute node, invoke Data Pump Import and connect to the database.

   Import the data into the database using the `TRANSPORT_DATAFILES` option.

```
impdp system DIRECTORY=dp_from_onprem \
TRANSPORT_DATAFILES='/u02/app/oracle/oradata/ORCL/fsdata01.dbf', \
'/u02/app/oracle/oradata/ORCL/fsindex01.dbf'
```

7. Set the tablespaces on the Database service database to `READ WRITE` mode.

a. Invoke SQL*Plus and log in as the `SYSTEM` user.

b. Set the `FSDATA` and `FSINDEX` tablespaces to `READ WRITE` mode.

```
SQL> ALTER TABLESPACE fsdata READ WRITE;
Tablespace altered.
SQL> ALTER TABLESPACE fsindex READ WRITE;
Tablespace altered.
```

c. Exit from SQL*Plus.

8. After verifying that the data has been imported successfully, you can delete the `expdat.dmp` dump file.

Remote Cloning a PDB

You can use this method only if the on-premises platform is little endian, the on-premises database release is 12.1.0.2 or higher, and the on-premises database and Database service database have compatible database character sets and national character sets.

You can use the remote cloning method to copy a PDB from your on-premises Oracle Database 12c database to a PDB in an Oracle Database 12c database on the Database service.

Migration Tasks

To migrate an Oracle Database 12c PDB to a PDB in a Database service database deployment using the remote cloning method, you perform these tasks:

1. On the on-premises database host, invoke SQL*Plus and close the on-premises PDB and then reopen it in `READ ONLY` mode.
2. On the Database service compute node, invoke SQL*Plus and create a database link that enables a connection to the on-premises database.
3. On the Database service compute node, execute the `CREATE PLUGGABLE DATABASE` command to clone the on-premises PDB.
4. On the Database compute node, open the new PDB by executing the `ALTER PLUGGABLE DATABASE OPEN` command.
5. Optionally, on the on-premises database host invoke SQL*Plus and set the on-premises PDB back to `READ WRITE` mode.

For more information, see "Cloning a Remote PDB or Non-CDB" in *Oracle Database Administrator's Guide* for Release 12.2 or 12.1.

Remote Cloning Non-CDB

You can use this method only if the on-premises platform is little endian, the on-premises database release is 12.1.0.2 or higher, and the on-premises database and Database service database have compatible database character sets and national character sets.

You can use the remote cloning method to copy an Oracle Database 12c non-CDB on-premises database to a PDB in an Oracle Database 12c database on the Databaseservice.

Migration Tasks

To migrate an Oracle Database 12c non-CDB database to a Database service database deployment using the remote cloning method, you perform these tasks:

1. On the on-premises database host, invoke SQL*Plus and set the on-premises database to `READ ONLY` mode.
2. On the Database service compute node, invoke SQL*Plus and create a database link that enables a connection to the on-premises database.
3. On the Database service compute node, execute the `CREATE PLUGGABLE DATABASE` command to clone the on-premises non-CDB database.
4. On the Database service compute node, execute the `$ORACLE_HOME/rdbms/admin/noncdb_to_pdb.sql` script.
5. On the Database service compute node, open the new PDB by executing the `ALTER PLUGGABLE DATABASE OPEN` command.
6. Optionally, on the on-premises database host invoke SQL*Plus and set the on-premises database back to `READ WRITE` mode.

For more information, see "Cloning a Remote PDB or Non-CDB" in *Oracle Database Administrator's Guide* for Release 12.2 or 12.1.

RMAN Cross-Platform Transportable PDB

This method can be used only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Database service database are compatible.

To migrate an Oracle Database 12c PDB to a PDB in an Oracle Database 12c database on a Database service deployment using the RMAN cross-platform transportable PDB method, you perform these tasks:

1. On the on-premises database host, invoke SQL*Plus and close the on-premises PDB.
2. On the on-premises database host, execute the `ALTER PLUGGABLE DATABASE UNPLUG` command to generate an XML file containing the list of datafiles that will be plugged in on the cloud database.
3. On the on-premises database host, invoke RMAN and connect to the root. Execute the `BACKUP FOR TRANSPORT PLUGGABLE DATABASE` command.
4. Use a secure copy utility to transfer the XML file and the backup set to the Database service compute node.
5. On the Database service compute node, invoke RMAN and connect to the root. Execute the `RESTORE ALL FOREIGN DATAFILES` command.
6. the Database service compute node, invoke SQL*Plus and connect to the root. Execute the `CREATE PLUGGABLE DATABASE` command.
7. the Database service compute node, execute the `ALTER PLUGGABLE DATABASE OPEN` command.

For more information, see " Performing Cross-Platform Data Transport in CDBs and PDBs" in *Oracle Database Backup and Recovery User's Guide* for Release 12.2 or 12.1.

RMAN Cross-Platform Transportable Tablespace Backup Sets

You can use this method only if the database character sets of your on-premises database and the Database service database are compatible.

Note

For detailed information on a similar method that enables you to perform a cross-platform transport of an entire database, see the *Oracle Database 12c Backup and Recovery User's Guide* for Release 12.2 or 12.1 . When you transport an entire database to a different platform, the source platform and the destination platform must use the same endian format.

To migrate Oracle Database 12c on-premises tablespaces to an Oracle Database 12c database on a Database service deployment using the RMAN cross-platform transportable backup sets method, you perform these tasks:

1. On the on-premises database host, prepare the database by placing the user-defined tablespaces that you intend to transport in `READ ONLY` mode.
2. On the on-premises database host, invoke RMAN and use the `BACKUP` command with the `TO PLATFORM` or `FOR TRANSPORT` clause and the `DATAPUMP` clause to create a backup set for cross-platform transport. See in "BACKUP" in *Oracle Database Backup and Recovery Reference* for Release 12.2 or 12.1 for more information on the `BACKUP` command.
3. Use a secure copy utility to transfer the backup sets, including the Data Pump export dump file, to the Database service compute node.
4. Set the on-premises tablespaces back to `READ WRITE`.
5. On the Database service compute node, prepare the database by creating the required schemas.
6. On the Database service compute node, invoke RMAN and use the `RESTORE` command with the `foreignFileSpec` subclause to restore the cross-platform backup.
7. On the Database service compute node, set the tablespaces on the database to `READ WRITE` mode.

For more information, see "Overview of Cross-Platform Data Transport Using Backup Sets" in *Oracle Database Backup and Recovery User's Guide* for Release 12.2 or 12.1.

RMAN Cross-Platform Transportable Tablespace Backup Sets: Example

This example provides a step-by-step demonstration of the tasks required to migrate tablespaces in an Oracle Database PDB to a Database service database.

This example performs a migration of the `FSDATA` and `FSINDEX` tablespaces.

In this example, the on-premises database is on a Linux host.

1. On the on-premises database host, prepare the database by creating a directory for the export dump file and placing the user-defined tablespaces that you intend to transport in READ ONLY mode..
    a. On the on-premises database host, create a directory in the operating system to use for the export dump.

    ```
    mkdir /u01/app/oracle/admin/orcl/dpdump/for_cloud
    ```

    b. On the on-premises data host, invoke SQL*Plus and log in to the PDB as the `SYSTEM` user..

    ```
    sqlplus system@pdb_servicename
    Enter password: enter the password for the SYSTEM user
    ```

    c. Create a directory object in the on-premises database to reference the operating system directory.

    ```
    SQL> CREATE DIRECTORY dp_for_cloud AS '/u01/app/oracle/admin/orcl/dpdump/for_cloud';
    ```

    d. On the on-premises database host, set all tablespaces that will be transported (the transportable set) to READ ONLY mode.

    ```
    SQL> ALTER TABLESPACE fsindex READ ONLY;
    SQL> ALTER TABLESPACE fsdata READ ONLY;
    ```

    e. Exit from SQL*Plus.
2. On the on-premises database host, invoke RMAN and use the `BACKUP` command with the `TO PLATFORM` or `FOR TRANSPORT` clause and the `DATAPUMP` clause to create a backup set for cross-platform transport.
    a. On the on-premises database host, create an operating system directory for the datafiles.

```
mkdir /u01/app/oracle/admin/orcl/rman_transdest
```

b. Invoke RMAN and log in as a user that has been granted the `SYSDBA` or `SYSBACKUP` privilege.

```
rman target username@pdb_servicename
```

c. Execute the `BACKUP` command.

```
RMAN> BACKUP FOR TRANSPORT
2> FORMAT '/u01/app/oracle/admin/orcl/rman_transdest/fs_tbs.bck'
3> TABLESPACE fsdata,fsindex
4> DATAPUMP FORMAT '/u01/app/oracle/admin/orcl/rman_transdest/fs_tbs.dmp';
```

d. Log out of RMAN.

e. Optionally, navigate to the directory you specified in the `BACKUP` command to view the files that were created.

```
cd /u01/app/oracle/admin/orcl/rman_transdest
$ ls
fs_tbs.bck  fs_tbs.dmp
```

3. Use a secure copy utility to transfer the backup set, including the Data Pump export dump file, to the Database service compute node.

a. On the Database service compute node, create a directory for the backup set and dump file.

```
mkdir /tmp/from_onprem
```

b. Before using the `scp` command to copy files, make sure the SSH private key that provides access to the Database service compute node is available on your on-premises host.

c. On the on-premises database host, use the SCP utility to transfer the backup set and the dump file to the Database service compute node.

```
scp -i private_key_file \
/u01/app/oracle/admin/orcl/rman_transdest/fs_tbs.bck \
oracle@IP_address_DBaaS_VM:/tmp/from_onprem

$ scp -i private_key_file \
/u01/app/oracle/admin/orcl/rman_transdest/fs_tbs.dmp \
```

```
oracle@IP_address_DBaaS_VM:/tmp/from_onprem

$
```

4. Set the on-premises tablespaces back to READ WRITE.
    a. Invoke SQL*Plus and log in to the PDB as the `SYSTEM` user.
    b. Set the `FSDATA` and `FSINDEX` tablespaces back to READ WRITE mode.

```
SQL> ALTER TABLESPACE fsdata READ WRITE;
SQL> ALTER TABLESPACE fsindex READ WRITE;
```

    c. Exit from SQL*Plus.
5. On the Database service compute node, prepare the database by creating the required schemas.
    a. On the Database service compute node, invoke SQL*Plus and log in to the PDB as the `SYSTEM` user.
    b. If the owners of the objects that will be imported do not exist in the database, create them before performing the `RESTORE`.

```
SQL> CREATE USER fsowner
  2  PROFILE default
  3  IDENTIFIED BY fspass
  4  TEMPORARY TABLESPACE temp
  5  ACCOUNT UNLOCK;
```

6. On the Database service compute node, invoke RMAN and use the `RESTORE` command with the `foreignFileSpec` subclause to restore the cross-platform backup.
    a. Create an operating system directory for the Data Pump Dump file.

```
mkdir /tmp/from_onprem
```

    b. Invoke RMAN and log in to the PDB as a user that has been granted the `SYSDBA` or `SYSBACKUP` privilege.

```
rman target username@pdb_servicename
```

    c. Execute the `RESTORE` command.

```
RMAN> RESTORE FOREIGN TABLESPACE fsdata,fsindex TO NEW
2> FROM BACKUPSET '/tmp/from_onprem/fs_tbs.bck'
3> DUMP FILE DATAPUMP DESTINATION '/tmp/datapump'
4> FROM BACKUPSET '/tmp/from_onprem/fs_tbs.dmp';
```

d. Exit from RMAN.

7. On the Database service compute node, set the tablespaces to READ WRITE mode.
   a. Invoke SQL*Plus and log in to the PDB as the `SYSTEM` user.
   b. Set the `FSDATA` and `FSINDEX` tablespaces to READ WRITE.

```
SQL> ALTER TABLESPACE fsdata READ WRITE;
SQL> ALTER TABLESPACE fsindex READ WRITE;
```

   c. Exit from SQL*Plus.
8. After verifying that the data has been imported successfully, you can delete the backup set files that were transported from the on-premises host.

RMAN Transportable Tablespace with Data Pump

You can use this method only if the on-premises platform is little endian, and the database character sets of your on-premises database and the Databaseservice database are compatible.

You can use this method to eliminate placing the tablespaces in `READ ONLY` mode, as required by the Data Pump Transportable Tablespace method.

To migrate an on-premises source database to a database deployment on the Database service using the RMAN Transportable Tablespace with Data Pump method, you perform these tasks:

1. On the on-premises database host, invoke RMAN and create the transportable tablespace set.
2. Use a secure copy utility to transfer the Data Pump Export dump file and the tablespace datafiles to the Database service compute node.
3. On the Database service compute node, prepare the database for the tablespace import.

4. On the Database service compute node, invoke Data Pump Import and connect to the database. Import the data into the database using the `TRANSPORT_DATAFILES` option.
5. After verifying that the data has been imported successfully, you can delete the dump file.

RMAN Transportable Tablespace with Data Pump: Example

This example provides a step-by-step demonstration of the tasks required to migrate tablespaces in an on-premises Oracle database to a Database service database.

This example performs a migration of the `FSDATA` and `FSINDEX` tablespaces.

In this example, the on-premises database is on a Linux host.

1. On the on-premises database host, invoke RMAN and create the transportable tablespace set.
    a. On the on-premises database host, create an operating system directory for the datafiles.

    ```
    mkdir /u01/app/oracle/admin/orcl/rman_transdest
    ```

    b. On the on-premises data host, create an operating system directory for the RMAN auxiliary instance files.

    ```
    mkdir /u01/app/oracle/admin/orcl/rman_auxdest
    ```

    c. Invoke RMAN and log in as the `SYSTEM` user. Enter the password for the `SYSTEM` user when prompted.

    ```
    rman target system
    ```

    d. Execute the `TRANSPORT TABLESPACE` command.

    ```
    RMAN> TRANSPORT TABLESPACE fsdata, fsindex
    2> TABLESPACE DESTINATION '/u01/app/oracle/admin/orcl/rman_transdest'
    3> AUXILIARY DESTINATION '/u01/app/oracle/admin/orcl/rman_auxdest';
    ```

    e. Log out of RMAN.
    f. Optionally, navigate to the directory you specified for the `TABLESPACE`

DESTINATION and view the files that were created by the TRANSPORT TABLESPACE operation.

```
cd /u01/app/oracle/admin/orcl/rman_transdest
$ ls
dmpfile.dmp  fsdata01.dbf  fsindex01.dbf  impscrpt.sql
```

2. Use a secure copy utility to transfer the Data Pump Export dump file and the tablespace datafiles to the Database service compute node.

   In this example the dump file is copied to the /u01 directory. Choose the appropriate location based on the size of the file that will be transferred.

   a. On the Database service compute node, create a directory for the dump file.

   ```
   mkdir /u01/app/oracle/admin/ORCL/dpdump/from_onprem
   ```

   b. Before using the scp command to copy files, make sure the SSH private key that provides access to the Database service compute node is available on your on-premises host.

   c. On the on-premises database host, use the SCP utility to transfer the dump file and all datafiles of the transportable set to the Database service compute node.

   ```
   scp -i private_key_file \
   /u01/app/oracle/admin/orcl/rman_transdest/dmpfile.dmp \
   oracle@IP_address_DBaaS_VM:/u01/app/oracle/admin/ORCL/dpdump/from_onprem

   $ scp -i private_key_file \
   /u01/app/oracle/admin/orcl/rman_transdest/fsdata01.dbf \
   oracle@IP_address_DBaaS_VM:/u02/app/oracle/oradata/ORCL

   $ scp -i private_key_file \
   /u01/app/oracle/admin/orcl/rman_transdest/fsindex01.dbf \
   oracle@IP_address_DBaaS_VM:/u02/app/oracle/oradata/ORCL
   ```

3. On the Database service compute node, prepare the database for the tablespace import.

   a. On the Database service compute node, invoke SQL*Plus and log in to the database as the SYSTEM user.

   b. Create a directory object in the Database service database.

```
SQL> CREATE DIRECTORY dp_from_onprem AS '/u01/app/oracle/admin/ORCL/dpdump/from_onprem';
```

c. If the owners of the objects that will be imported do not exist in the database, create them before performing the import. The transportable tablespace mode of import does not create the users.

```
SQL> CREATE USER fsowner
  2  PROFILE default
  3  IDENTIFIED BY fspass
  4  TEMPORARY TABLESPACE temp
  5  ACCOUNT UNLOCK;
```

4. On the Database service compute node, invoke Data Pump Import and connect to the database.

   Import the data into the database using the `TRANSPORT_DATAFILES` option.

```
impdp system DIRECTORY=dp_from_onprem DUMPFILE='dmpfile.dmp' \
TRANSPORT_DATAFILES='/u02/app/oracle/oradata/ORCL/fsdata01.dbf', \
'/u02/app/oracle/oradata/ORCL/fsindex01.dbf'
```

5. After verifying that the data has been imported successfully, you can delete the `dmpfile.dmp` dump file.

RMAN CONVERT Transportable Tablespace with Data Pump

You can use this method only if the database character sets of your on-premises database and the Database service database are compatible.

This method is similar to the Data Pump Transportable Tablespace method, with the addition of the RMAN `CONVERT` command to enable transport between platforms with different endianness. Query `V$TRANSPORTABLE_PLATFORM` to determine if the on-premises database platform supports cross-platform tablespace transport and to determine the endian format of the platform. The Database service platform is little-endian format.

To migrate tablespaces from your on-premises Oracle database to a database deployment on the Database service using RMAN, you perform these tasks:

1. On the on-premises database host, prepare the database for the Data Pump transportable tablespace export.

2. On the on-premises database host, invoke Data Pump Export to perform the transportable tablespace export.
3. On the on-premises database host, invoke RMAN and use the `CONVERT TABLESPACE` command to convert the tablespace datafile to the Database service platform format. Refer to the Oracle Database Backup and Recovery Reference for more information on the `CONVERT` command.
4. Use a secure copy utility to transfer the Data Pump Export dump file and the converted tablespace datafiles to the Database service compute node.
5. Set the on-premises tablespaces back to `READ WRITE`.
6. On the Database service compute node, prepare the database for the tablespace import.

7. On the Database service compute node, invoke Data Pump Import and connect to the database.
8. On the Database service compute node, set the tablespaces in the database to `READ WRITE` mode.
9. After verifying that the data has been imported successfully, you can delete the dump file.

RMAN CONVERT Transportable Tablespace with Data Pump: Example

This example provides a step-by-step demonstration of the tasks required to migrate tablespaces in an on-premises Oracle database to a Database service database.

In this example, the on-premises database is on a Linux host.

1. On the on-premises database host, prepare the database for the Data Pump transportable tablespace export.
    a. On the on-premises database host, create a directory in the operating system to use for the on-premises export.

    ```
    mkdir /u01/app/oracle/admin/orcl/dpdump/for_cloud
    ```

    b. On the on-premises database host, invoke SQL*Plus and log in to the on-premises

database as the SYSTEM user.

```
sqlplus system
Enter password: <enter the password for the SYSTEM user>
```

c. Create a directory object in the on-premises database to reference the operating system directory.

```
SQL> CREATE DIRECTORY dp_for_cloud AS '/u01/app/oracle/admin/orcl/dpdump/for_cloud';
```

d. On the on-premises database host, set all tablespaces that will be transported (the transportable set) to READ ONLY mode.

```
SQL> ALTER TABLESPACE fsindex READ ONLY;
Tablespace altered.
SQL> ALTER TABLESPACE fsdata READ ONLY;
Tablespace altered.
```

e. Exit from SQL*Plus.

2. On the on-premises database host, invoke Data Pump Export to perform the transportable tablespace export.

   On the on-premises database host, invoke Data Pump Export and connect to the on-premises database. Export the on-premises tablespaces using the TRANSPORT_TABLESPACES option. Provide the password for the SYSTEM user when prompted.

```
expdp system TRANSPORT_TABLESPACES=fsdata,fsindex TRANSPORT_FULL_CHECK=YES DIRECTORY=dp_for_cloud
```

3. On the on-premises database host, invoke RMAN and use the CONVERT TABLESPACE command to convert the tablespace datafile to the Database service platform format.

   a. Invoke RMAN.

```
rman target /
```

   b. Execute the RMAN CONVERT TABLESPACE command to convert the datafiles and store the converted files in a temporary location on the on-premises database host.

```
RMAN> CONVERT TABLESPACE fsdata, fsindex
   2> TO PLATFORM 'Linux x86 64-bit'
   3> FORMAT '/tmp/%U ';
…
```

```
input datafile file number=00006 name=/u01/app/oracle/oradata/orcl/fsdata01.dbf
converted datafile=/tmp/data_D-ORCL_I-1410251631_TS-FSDATA_FNO-6_0aqc9un3
…
input datafile file number=00007 name=/u01/app/oracle/oradata/orcl/fsindex01.dbf
converted datafile=/tmp/data_D-ORCL_I-1410251631_TS-FSINDEX_FNO-7_0bqc9un6
…
```

c. Take note of the names of the converted files. You will copy these files to the Database service compute node in the next step.

d. Exit RMAN.

4. Use a secure copy utility to transfer the Data Pump Export dump file and the converted tablespace datafiles to the Database service compute node.

   In this example the dump file is copied to the `/u01` directory. Choose the appropriate location based on the size of the file that will be transferred.

   a. On the Databaseservice compute node, create a directory for the dump file.

   ```
   mkdir /u01/app/oracle/admin/ORCL/dpdump/from_onprem
   ```

   b. Before using the `scp` command to copy files, make sure the SSH private key that provides access to the Database service compute node is available on your on-premises host.

   c. On the on-premises database host, use the `scp` utility to transfer the dump file and all data files of the transportable set to the Database service compute node.

   ```
   scp -i private_key_file \
   /u01/app/oracle/admin/orcl/dpdump/for_cloud/expdat.dmp \
   oracle@IP_address_DBaaS_VM:/u01/app/oracle/admin/ORCL/dpdump/from_onprem

   $ scp -i private_key_file \
   /tmp/data_D-ORCL_I-1410251631_TS-FSDATA_FNO-6_0aqc9un3 \
   oracle@IP_address_DBaaS_VM:/u02/app/oracle/oradata/ORCL/fsdata01.dbf

   $ scp -i private_key_file \
   /tmp/data_D-ORCL_I-1410251631_TS-FSINDEX_FNO-7_0bqc9un6 \
   oracle@IP_address_DBaaS_VM:/u02/app/oracle/oradata/ORCL/fsindex01.dbf
   ```

5. Set the on-premises tablespaces back to `READ WRITE`.

a. Invoke SQL*Plus and log in as the `SYSTEM` user.

b. Set the `FSDATA` and `FSINDEX` tablespaces back to `READ WRITE` mode.

```
SQL> ALTER TABLESPACE fsdata READ WRITE;
Tablespace altered.
SQL> ALTER TABLESPACE fsindex READ WRITE;
Tablespace altered.
```

c. Exit from SQL*Plus.

6. On the Database service compute node, prepare the database for the tablespace import.

a. On the Database service compute node, invoke SQL*Plus and log in to the database as the `SYSTEM` user.

b. Create a directory object in the Database service database.

```
SQL> CREATE DIRECTORY dp_from_onprem AS '/u01/app/oracle/admin/ORCL/dpdump/from_onprem';
```

c. If the owners of the objects that will be imported do not exist in the database, create them before performing the import. The transportable tablespace mode of import does not create the users.

```
SQL> CREATE USER fsowner
  2  PROFILE default
  3  IDENTIFIED BY fspass
  4  TEMPORARY TABLESPACE temp
  5  ACCOUNT UNLOCK;
```

7. On the Database service compute node, invoke Data Pump Import and connect to the database.

   Import the data into the Database service database using the `TRANSPORT_DATAFILES` option

```
impdp system DIRECTORY=dp_from_onprem \
TRANSPORT_DATAFILES='/u02/app/oracle/oradata/ORCL/fsdata01.dbf', \
'/u02/app/oracle/oradata/ORCL/fsindex01.dbf'
```

8. On the Database service compute node, set the tablespaces in the database to `READ WRITE` mode.

a. Invoke SQL*Plus and log in as the `SYSTEM` user.

b. Set the `FSDATA` and `FSINDEX` tablespaces to `READ WRITE` mode.

```
SQL> ALTER TABLESPACE fsdata READ WRITE;
Tablespace altered.
SQL> ALTER TABLESPACE fsindex READ WRITE;
Tablespace altered.
```

c. Exit from SQL*Plus.

9. After verifying that the data has been imported successfully, you can delete the `expdat.dmp` dump file.

RMAN DUPLICATE from an Active Database

This topic explains how to migrate an entire, active container database (CDB) or non-CDB database to Oracle Cloud Infrastructure by using RMAN Active Duplication. The database to be migrated can reside on-premises or in Oracle Cloud Infrastructure Classic. This topic does not cover duplicating a pluggable database, or migrating a pluggable database or non-CDB to a CDB in the cloud.

The following terms are used throughout this topic:

- Source database: The active database to be migrated.
- Target database: The new database (duplicated from the source database) on a DB system in the Oracle Cloud Infrastructure.

Note

Version 11.2.0.4 databases will be migrated to a DB system using a ACFS storage.

Prerequisites

For the source database to be migrated, you'll need:

- The source database name, database unique name, listener port, service name, database home patch level, and the password for SYS.
- A copy of the sqlpatch directory from the source database home. This is required for rollback in case the target DB system does not include these patches.
- If the source database is configured with Transparent Data Encryption (TDE), you'll need a backup of the wallet and the wallet password to allow duplication of a database with encrypted data.

When migrating a source database to an existing target database, Oracle recommends that you patch the source environment to the same database bundle patch level as the target database home. If the source environment has an interim patch (previously known as a "one-off" patch) that includes a sqlpatch component, and that sqlpatch is missing from the target environment (or a different cumulative patch is applied), the interim patch should be rolled back in the source environment before the migration, if possible.

Tip

To check for interim patches installed on the source or target database, use the `$ORACLE_HOME/OPatch/opatch lspatches` command. To roll back SQL changes in the target database, copy the `$ORACLE_HOME/sqlpatch/<patch#>/postdeinstall.sql` script from the source environment to the cloud environment and execute the `postdeinstall.sql` script.

For the target database, you'll need:

- A target DB system that supports the same database edition as the source database edition. When you launch a DB system, an initial database is created on it. If necessary, you can delete that database and create a new one by using the dbcli command line interface. For more information on creating a DB system, see Managing Bare Metal and Virtual Machine DB Systems. For information about creating a database with the DBCLI,

see Database Commands.

- The target database name, database unique name, auxiliary service name, and database home patch level.
- A free TCP port in the target database to setup the auxiliary instance.

If you need to roll back interim patches in the target environment so that the patch level matches that of the source environment, copy the source DB $ORACLE_HOME/sqlpatch/*<patch_number>* directory to the target database home.

Migrating Source Databases That Include Patch Set Updates (PSUs)

In Oracle Cloud Infrastructure DB systems, the database home includes an installation of Database Proactive Bundle Patches. If the source DB uses Patch Set Updates (PSUs), follow the instructions in MOS Note:1962125.1 (Oracle Database - Overview of Database Patch Delivery Methods) for migrating the DB into Oracle Cloud Infrastructure.

Verifying the Environment

Perform the following steps before you begin the migration:

1. Make sure the source DB system is reachable from the target DB system. You should be able to SSH between the two hosts.
2. On the target host, use the TNSPING utility to make sure the source host listener port works. For example:

   ```
   tnsping <source_host>:1521
   ```

3. On the target host, use Easy Connect to verify the connection to the source database:

   ```
   <host>:<port>/<service_name>
   ```

   For example:

   ```
   sqlplus system@129.145.0.164:1521/proddb
   ```

   Make sure the connection string does not exceed 64 characters.
4. Copy the required sqlpatch files (for rollback) from the source database home to the target database.

5. Make sure at least one archivelog has been created on the source database, otherwise, the RMAN duplication will fail with an error.
6. If the source database uses wallets, back up the password-based wallet and copy it to the standard location in the DB system:

```
/opt/oracle/dcs/commonstore/wallets/tde/<db_unique_name>/
```

7. Make sure the compatibility parameters in the source database are set to at least:
   - 18.0.0.0.0 for an 18.1.0.0 database
   - 12.1.0.2.0 for a 12.1.0.2 or a 12.2.0.1 database
   - 11.2.0.4.0 for an 11.2.0.4 database

Setting Up Storage on the DB System

1. SSH to the DB System.

```
ssh -i <private_key_path> opc@<db_system_ip_address>
```

2. Log in as opc and then sudo to the root user. Use `sudo su -` with a hyphen to invoke the root user's profile, which will set the PATH to the dbcli directory (`/opt/oracle/dcs/bin`).

```
login as: opc

[opc@dbsys ~]$ sudo su -
```

3. Use the dbcli create-dbstorage to set up directories for DATA, RECO, and REDO storage. The following example creates 10GB of ACFS storage for the tdetest database.

```
[root@dbsys ~]# dbcli create-dbstorage --dbname tdetest --dataSize 10 --dbstorage ACFS
```

Note

When migrating a version 11.2 database, ACFS storage must be specified.

4. Use the dbcli list-dbstorages command to list the storage ID. You'll need the ID for the

next step.

```
[root@dbsys ~]# dbcli list-dbstorages
ID                                       Type   DBUnique Name        Status
---------------------------------------- ------ -------------------- ----------
9dcdfb8e-e589-4d5f-861a-e5ba981616ed     Acfs   tdetest              Configured
```

5. Use the dbcli describe-dbstorage command with the storage ID from the previous step to list the DATA, RECO and REDO locations.

```
[root@dbsys ~]# dbcli describe-dbstorage --id 9dcdfb8e-e589-4d5f-861a-e5ba981616ed
DBStorage details
----------------------------------------------------------------
                     ID: 9dcdfb8e-e589-4d5f-861a-e5ba981616ed
                DB Name: tdetest
          DBUnique Name: tdetest
         DB Resource ID:
           Storage Type: Acfs
          DATA Location: /u02/app/oracle/oradata/tdetest
          RECO Location: /u03/app/oracle/fast_recovery_area/
          REDO Location: /u03/app/oracle/redo/
                  State: ResourceState(status=Configured)
                Created: August 24, 2016 5:25:38 PM UTC
            UpdatedTime: August 24, 2016 5:25:53 PM UTC
```

Note the locations. You'll use them later to set the `db_create_file_dest`, `db_create_online_log_dest`, and `db_recovery_file_dest` parameters for the database.

Choosing an ORACLE_HOME

Decide which ORACLE_HOME to use for the database restore and then switch to that home with the correct ORACLE_BASE, ORACLE_HOME, and PATH settings.

To get a list of existing ORACLE_HOMEs, use the dbcli list-dbhomes command. To create a new ORACLE_HOME, use the dbcli create-dbhome command.

Copying the Source Database Wallets

Skip this section if the source database is **not** configured with TDE.

1. On the DB system, become the oracle user:

```
sudo su - oracle
```

2. Create the following directory if it does not already exist:

```
mkdir /opt/oracle/dcs/commonstore/wallets/tde/<db_unique_name>
```

3. Copy the ewallet.p12 file from the source database to the directory you created in the previous step.
4. On the target host, make sure that `$ORACLE_HOME/network/admin/sqlnet.ora` contains the following line:

```
ENCRYPTION_WALLET_LOCATION=(SOURCE=(METHOD=FILE)(METHOD_DATA=
(DIRECTORY=/opt/oracle/dcs/commonstore/wallets/tde/$ORACLE_UNQNAME)))
```

   Add the line if it doesn't exist in the file. (The line might not be there if this is a new home and no database has been created yet on this host.)
5. Create the autologin wallet from the password-based wallet to allow auto-open of the wallet during restore and recovery operations.

   For version 12c, use the `ADMINISTER KEY MANAGEMENT` command:

```
$cat create_autologin_12.sh

#!/bin/sh
if [ $# -lt 2 ]; then
        echo "Usage: $0 <db_unique_name> <remote_wallet_location>"
        exit 1;
fi

mkdir /opt/oracle/dcs/commonstore/wallets/tde/$1
cp $2/ewallet.p12* /opt/oracle/dcs/commonstore/wallets/tde/$1
rm -f autokey.ora
echo "db_name=$1"  > autokey.ora
autokeystoreLog="autologinKeystore_`date +%Y%m%d_%H%M%S_%N`.log"
echo "Enter Keystore Password:"
read -s keystorePassword
echo "Creating AutoLoginKeystore -> "
sqlplus "/as sysdba"  <<EOF
spool $autokeystoreLog
set echo on
```

```
startup nomount pfile=autokey.ora
ADMINISTER KEY MANAGEMENT CREATE AUTO_LOGIN KEYSTORE
FROM KEYSTORE '/opt/oracle/dcs/commonstore/wallets/tde/$1' -- Keystore location
IDENTIFIED BY "$keystorePassword";
shutdown immediate;
EOF
```

For version 11g, use the `orapki` command:

```
orapki wallet create -wallet wallet_location -auto_login [-pwd <password>]
```

Setting Up the Static Listener

Set up the static listener for the auxiliary instance for RMAN duplication.

1. On the DB system, create `$ORACLE_HOME/network/admin/listener.ora` and add the following content to it.

```
LISTENER_aux_<db_unique_name>=
  (DESCRIPTION=
    (ADDRESS_LIST=
      (ADDRESS=(PROTOCOL=TCP)(HOST=<hostname> or <ip_address>)(PORT=<available_TCP_port>))
    )
   )
SID_LIST_LISTENER_aux_<db_unique_name>=
  (SID_LIST=
    (SID_DESC=
      (GLOBAL_DBNAME=<auxServiceName_with_domain>)
       (ORACLE_HOME=<Oracle_home_for_target_database>)
       (SID_NAME=<database_name>)
       (ENVS="TNS_ADMIN=<path_to_tnsnames.ora>")
       (ENVS="ORACLE_UNQNAME=<db_unique_name(in lower case)>"))
)
```

2. Make sure the port specified in `(PORT=<available_TCP_port>)` is open in the DB system's iptables and in the DB system's cloud network Security List.

Using the RMAN Duplicate Command to Migrate the Database

1. Set the following environment variables for RMAN and SQL Plus sessions for the database:

```
ORACLE_HOME=<path_of_Oracle_home_where_the database_is_to_be_restored>
ORACLE_SID=<database_name>
ORACLE_UNQNAME=<db_unique_name(in lower case)>
NLS_DATE_FORMAT="mm/dd/yyyy hh24:mi:ss"
```

2. Start the listener:

```
lsnrctl start listener_aux_<db_unique_name>
```

3. Create an `init.ora` file with the minimal required parameters as described in Creating an Initialization Parameter File and Starting the Auxiliary Instance and use it for the auxiliary instance.
4. Start the auxiliary instance in nomount mode:

```
startup nomount
```

5. Run the following commands to duplicate the database. Note that the example below uses variables to indicate the values to be specified:

```
rman target sys/$sourceSysPassword@$sourceNode:$sourceListenerPort/$sourceDb auxiliary
sys/$auxSysPassword@$targetNode:$targetListenerPort/$auxService<<EOF

spool log to "`date +%Y%m%d_%H%M%S_%N`_duplicate_${targetDbUniqueName}_from_${sourceDb}.log"
set echo on

duplicate target database to $targetDb from active database
password file
spfile
 PARAMETER_VALUE_CONVERT $sourceDb $targetDb $sourceDbUniqueNameCaps $targetDbUniqueNameCaps
 set cluster_database='false'
 set db_name='$targetDb'
 set db_unique_name='$targetDbUniqueName'
 set db_create_file_dest='$dataLoc'
 set db_create_online_log_dest_1='$redoLoc'
 set db_recovery_file_dest='$recoLoc'
 set audit_file_dest = '$auditFileDest'
 reset control_files
nofilenamecheck
;
EOF
```

Preparing to Register the Database

Before you register the database:

1. Make sure the database COMPATIBLE parameter value is acceptable.
   For a 11.2 database, the minimum compatibility value is 11.2.0.4.
   For a 12c database, the minimum compatibility value is 12.1.0.2.
   If the value is less than the minimum, the database cannot be registered until you upgrade the database compatibility.
2. Use the following command to verify that the database has registered with the local listener and service name.

   ```
   lsnrctl services
   ```

3. Use the following command to verify that the password file was restored or created for a new database.

   ```
   ls -ltr $ORACLE_HOME/dbs/orapw<$ORACLE_SID>
   ```

   If the file does not exist, create it using the orapwd command.

   ```
   orapwd file=<$ORACLE_HOME/dbs/orapw<$ORACLE_SID>> password=<sys_password>
   ```

4. Use the following command to verify that the restored database is open in read write mode.

   ```
   select open_mode from v$database;
   ```

   Read write mode is required to register the database later. Any PDBs must also be in read write mode.
5. From oracle home on the migrated database host, use the following command verify the connection to SYS.

   ```
   conn sys/<password>@<service_name> as sysdba
   ```

   This connection is required to register the database later. Fix any connection issues before continuing.
6. Copy the folder `$ORACLE_HOME/sqlpatch` from source database to the target database. This will enable the `dbcli register-database` command to rollback any conflicting patches.

Note

If you are migrating a version 11.2 database, additional steps are required after you register the database. For more information, see Rolling Back Patches on a Version 11.2 Database.

7. Use the following SQL*Plus command to make sure the database is using the spfile.

```
SHOW PARAMETERS SPFILE
```

Registering the Database on the DB System

The dbcli register-database command registers the migrated database to the dcs-agent so it can be managed by the dcs-agent stack.

Note

The `dbcli register-database` command is not available on 2-node RAC DB Systems.

As the root user, use the `dbcli register-database` command to register the database on the DB system, for example:

```
[root@dbsys ~]# dbcli register-database --dbclass OLTP --dbshape odb1 --servicename crmdb.example.com --
syspassword
Password for SYS:
{
  "jobId" : "317b430f-ad5f-42ae-bb07-13f053d266e2",
  "status" : "Created",
  "message" : null,
  "reports" : [ ],
  "createTimestamp" : "August 08, 2016 05:55:49 AM EDT",
  "description" : "Database service registration with db service name: crmdb.example.com",
  "updatedTime" : "August 08, 2016 05:55:49 AM EDT"
}
```

Migrating a Version 12.1 or Later Database That Includes SQL Patch Components

For a 1-node DB system at version 12.1 or higher, the `dbcli register-database` command automates the datapatch execution. Before executing the `dbcli register-database` command, open all PDBs in read-write mode. If you have already run the `dbcli register-database` command and did not open all PDBs, or did not copy the $ORACLE_HOME/sqlpatch directory from the source database home, manually rerun the datapatch utility to configure the SQL portion of existing interim patches. This can be done by executing the command `$ORACLE_HOME/OPatch/opatch datapatch`.

Tip

If the source database includes patch 23170620 and the target database is running with the October 2017 patch or a later one, the $ORACLE_HOME/sqlpatch directory does not need to be copied to the target database, because the contents of the patch are already installed in the target database.

Rolling Back Patches on a Version 11.2 Database

For version 11.2 databases, the sqlpatch application is not automated, so any interim patches (previously known as a "one-off" patches) applied to the source database that are not part of the installed PSU must be rolled back manually in the target database. After registering the database, execute the `catbundle.sql` script and then the `postinstall.sql` script with the corresponding PSU patch (or the overlay patch on top of the PSU patch), as described below.

Tip

Some interim patches may include files written to the $ORACLE_HOME/rdbms/admin directory as well as the $ORACLE_HOME/sqlpatch directory. Oracle recommends that you roll back these patches in the source database using the instructions in the patch read-me prior to migrating the database to OCI environment. Contact Oracle Support if you need assistance with rolling back these patches.

1. On the DB System, use the `dbcli list-dbhomes` command to find the PSU patch number for the version 11.2 database home. In the following sample command output, the PSU patch number is the second number in the DB Version column:

```
[root@dbsys ~]# dbcli  list-dbhomes
ID                                   Name                DB Version
Home Location                                Status
------------------------------------ ------------------  ------------------------------------  --
---------------------------------------- ----------
59d9bc6f-3880-4d4f-b5a6-c140f16f8c64 OraDB11204_home1  11.2.0.4.160719 (23054319, 23054359)
/u01/app/oracle/product/11.2.0.4/dbhome_1 Configured
```

   (The first patch number, 23054319 in the example above, is for the OCW component in the database home.)

2. Find the overlay patch, if any, by using the `lsinventory` command. In the following example, patch number *24460960* is the overlay patch on top of the 23054359 PSU patch.

```
$ $ORACLE_HOME/OPatch/opatch lsinventory
...
Installed Top-level Products (1):

Oracle Database 11g                                                  11.2.0.4.0
There are 1 products installed in this Oracle Home.
```

```
Interim patches (5) :

Patch  24460960     : applied on Fri Sep 02 15:28:17 UTC 2016
Unique Patch ID:  20539912
   Created on 31 Aug 2016, 02:46:31 hrs PST8PDT
   Bugs fixed:
     23513711, 23065323, 21281607, 24006821, 23315889, 22551446, 21174504
   This patch overlays patches:
     23054359
   This patch needs patches:
     23054359
   as prerequisites
```

3. Start SQL*Plus and execute the `catbundle.sql` script, for example:

```
SQL> startup
SQL> connect / as sysdba
SQL> @$ORACLE_HOME/rdbms/admin/catbundle.sql psu apply
exit
```

4. Apply the sqlpatch, using the overlay patch number from the previous step, for example:

```
SQL> connect / as sysdba
SQL> @$ORACLE_HOME/sqlpatch/24460960/postinstall.sql
exit
```

Creating a Backup Configuration (Optional)

If you would like to manage the database backup with the dbcli command line interface, you can associate a new or existing backup configuration with the migrated database when you register it or after you register it. A backup configuration defines the backup destination and recovery window for the database. As the root user, use the following commands to create, list, and display backup configurations:

- dbcli update-backupconfig
- dbcli list-backupconfigs
- dbcli describe-backupconfig

Post Migration Checklist

After the database is migrated and registered on the DB system, use the following checklist to verify the results of the migration and perform any post-migration customizations.

1. Make sure the database files were restored in OMF format.
2. Make sure the database is listed in the dbcli list-databases command output.
3. Check for the following external references in the database and update them if necessary:
    - External tables: If the source database uses external tables, back up that data and migrate it to the target host.
    - Directories: Customize the default directories as needed for the migrated database.
    - Database links: Make sure all the required TNS entries are updated in the tnsnames.ora file in ORACLE_HOME.
    - Email and URLs: Make sure any email addresses and URLs used in the database are still accessible from the DB system.
    - Scheduled jobs: Review the jobs scheduled in source database and schedule similar jobs as needed in the migrated database.
4. If you associated a backup configuration when you registered the database, run a test back up using the dbcli create-backup command.
5. Verify that patches have been applied to all PDBs if the migrated database contains CDB and PDBs.
6. Validate the database performance by using Database Replay and SQL Performance Analyzer for SQL. For more information, see the Database Testing Guide.

SQL Developer and INSERT Statements to Migrate Selected Objects

You can use SQL Developer to create a cart into which you add selected objects to be loaded into an Oracle Database 12c database in the Oracle Cloud Infrastructure Database service.

In this method, you use SQL `INSERT` statements to load the data into your cloud database.

To migrate selected objects to an Oracle Database 12c database in a Database service deployment using SQL Developer and `INSERT` statements, you perform these tasks:

1. Launch SQL Developer, connect to your on-premises database and create a cart containing the objects you want to migrate.
2. In SQL Developer, click the Export Cart icon and select "Insert" in the Format menu.
3. In SQL Developer, open a connection to the Oracle Database 12c database in the Database service and execute the generated script to create the database objects.
4. In SQL Developer, open a connection to the Oracle Database 12c database in the Database service and run the generated script to create the objects and load the data.

SQL Developer and SQL*Loader to Migrate Selected Objects

You can use SQL Developer to create a cart into which you add selected objects to be loaded into an Oracle Database 12c database in the Oracle Cloud Infrastructure Database.

In this method, you use SQL*Loader to load the data into your cloud database.

To migrate selected objects to an Oracle Database 12c database in the Database service deployment using SQL Developer and SQL*Loader, you perform these tasks:

1. Launch SQL Developer, connect to your on-premises database and create a cart containing the objects you want to load into your cloud database.
2. In SQL Developer, click the Export Cart icon and select "loader" in the Format menu.
3. In SQL Developer, open a connection to the Oracle Database 12c database on the Database service and execute the generated script to create the database objects.
4. Use a secure copy utility to transfer the SQL*Loader control files and the SQL*Loader data files to the the Database service compute node.
5. On the the Database service compute node, invoke SQL*Loader to load the data using the SQL*Loader control files and data files for each object.

Unplugging/Plugging a PDB

You can use this method only if the on-premises platform is little endian, and the on-premises database and the Oracle Cloud Infrastructure Database service database have compatible database character sets and national character sets.

You can use the unplug/plug method to migrate an Oracle Database 12c PDB to a PDB in an Oracle Database 12c database on a Database service database deployment.

To migrate an Oracle Database 12c PDB to a PDB in the Oracle Database 12c database on an Oracle Cloud Infrastructure Database service database deployment using the plug/unplug method, you perform these tasks:

1. On the on-premises database host, invoke SQL*Plus and close the on-premises PDB.
2. On the on-premises database host, execute the `ALTER PLUGGABLE DATABASE UNPLUG` command to generate an XML file containing the list of datafiles that will be plugged in to the database on the Database service.
3. Use a secure copy utility to transfer the XML file and the datafiles to the Databaseservice compute node.
4. On the Database service compute node, invoke SQL*Plus and execute the `CREATE PLUGGABLE DATABASE` command to plug the database into the CDB.
5. On the Database service compute node, open the new PDB by executing the `ALTER PLUGGABLE DATABASE OPEN` command.

For more information, see "Creating a PDB by Plugging an Unplugged PDB into a CDB" in *Oracle Database Administrator's Guide* for Release 12.2 or 12.1.

Unplugging/Plugging Non-CDB

You can use this method only if the on-premises platform is little endian, and the on-premises database and the Oracle Cloud Infrastructure Database database have compatible database character sets and national character sets.

You can use the unplug/plug method to migrate an Oracle Database 12c non-CDB database to a PDB in an Oracle Database 12c database on a Database service database deployment. This

method provides a way to consolidate several non-CDB databases into a single Oracle Database 12c multitenant database on the Database service.

To migrate an Oracle Database 12c non-CDB database to the Oracle Database 12c database on a Database service deployment using the plug/unplug method, you perform these tasks:

1. On the on-premises database host, invoke SQL*Plus and set the on-premises database to `READ ONLY` mode.
2. On the on-premises database host, execute the `DBMS_PDB.DESCRIBE` procedure to generate an XML file containing the list of datafiles that will be plugged in on the cloud database.
3. Use a secure copy utility to transfer the XML file and the datafiles to the Database service compute node.
4. On the Database service compute node, invoke SQL*Plus and execute the `CREATE PLUGGABLE DATABASE` command to plug the database into the CDB.
5. On the Database service compute node, execute the `$ORACLE_HOME/rdbms/admin/noncdb_to_pdb.sql` script to delete unnecessary metadata from the `SYSTEM` tablespace of the new PDB.
6. On the Database service compute node, open the new PDB by executing the `ALTER PLUGGABLE DATABASE OPEN` command.
7. Optionally, on the on-premises database host invoke SQL*Plus and set the on-premises database back to `READ WRITE` mode.

For more information, see "Creating a PDB Using a Non-CDB" in *Oracle Database Administrator's Guide* for Release 12.2 or 12.1.

Troubleshooting

These topics cover some common issues you might run into and how to address them.

- Backup Failures
- Patching Failures

Backup Failures

Database backups can fail for various reasons. Typically, a backup fails because either the database host cannot access the object store, or there are problems on the host or with the database configuration.

This topic includes information to help you determine the cause of the failure and fix the problem. The information is organized into several sections, based on the error condition. If you already know the cause, you can skip to the section with the suggested solution. Otherwise, use the procedure in Determining the Problem to get started.

Determining the Problem

In the Console, a failed database backup either displays a status of **Failed** or hangs in the **Backup in Progress** or **Creating** state. If the error message does not contain enough information to point you to a solution, you can use the database CLI and log files to gather more data. Then, refer to the applicable section in this topic for a solution.

To identify the root cause of the backup failure

1. Log on to the host as the root user and navigate to the `/opt/oracle/dcs/bin/` directory.
2. Determine the sequence of operations performed on the database.

   ```
   dbcli list-jobs | grep -i <dbname>
   ```

   Note the last job ID listed with a status other than **Success**.
3. With the job ID you noted from the previous step, use the following command to check the details of that job:

   ```
   dbcli describe-job -i <job_ID> -j
   ```

   Typically, running this command is enough to reveal the root cause of the failure.
4. If you require more information, review the `/opt/oracle/dcs/log/dcs-agent.log` file.

You can find the job ID in this file by using the timestamp returned by the job report in step 2.

5. If the problem details suggest an RMAN issue, review the RMAN logs in the `/opt/oracle/dcs/log/<hostname>/rman/bkup/<db_unique_name>/rman_backup/<yyyy-mm-dd>` directory.

Note

If the database failure is on a 2-node RAC database, perform steps 3 and 4 on both nodes.

Database Service Agent Issues

Your Oracle Cloud Infrastructure Database makes use of an agent framework to allow you to manage your database through the cloud platform. Occasionally you might need to restart the dcsagent program if it has the status of **stop/waiting** to resolve a backup failure.

To restart the database service agent

1. From a command prompt, check the status of the agent:

```
initctl status initdcsagent
```

2. If the agent is in the **stop/waiting** state, try to restart the agent:

```
initctl start initdcsagent
```

3. Check the status of the agent again to confirm that it has the **start/running** status:

```
initctl status initdcsagent
```

Oracle Clusterware Issues

Oracle Clusterware enables servers to communicate with each other so that they can function as a collective unit. Occasionally you might need to restart the Clusterware program to

resolve a backup failure.

To restart the Oracle Clusterware

1. From command prompt, check the status of Oracle Clusterware:

   ```
   crsctl check crs
   ```

   ```
   crsctl stat res -t
   ```

2. If Oracle Clusterware is not online, try to restart the program:

   ```
   crsctl start crs
   ```

3. Check the status of Oracle Clusterware to confirm that it is online:

   ```
   crsctl check crs
   ```

Object Store Connectivity Issues

Backing up your database to Oracle Cloud Infrastructure Object Storage requires that the host can connect to the applicable Swift endpoint. You can test this connectivity by using a Swift user.

To ensure your database host can connect to the object store

1. Create a Swift user in your tenancy. See Working with Auth Tokens.
2. With the user you created in the previous step, use the following command to verify the host can access the object store.

   ```
   curl -v -X HEAD -u <user_ID>:'<auth_token>' https://swiftobjectstorage.<region_
   name>.oraclecloud.com/v1/<tenant>
   ```

   See https://cloud.oracle.com/infrastructure/storage/object-storage/faq for the correct region to use.
3. If you cannot connect to the object store, refer to Prerequisites for how to configure object store connectivity.

Host Issues

One or more of the following conditions on the database host can cause backups to fail:

Interactive Commands in the Oracle Profile

If an interactive command such as `oraenv`, or any command that might return an error or warning message, was added to the `.bash_profile` file for the grid or oracle user, Database service operations like automatic backups can be interrupted and fail to complete. Check the `.bash_profile` file for these commands, and remove them.

The File System Is Full

Backup operations require space in the `/u01` directory on the host file system. Use the `df -h` command on the host to check the space available for backups. If the file system has insufficient space, you can remove old log or trace files to free up space.

Incorrect Version of the Oracle Database Cloud Backup Module

Your system might not have the required version of the backup module (opc_installer.jar). See Unable to use Managed Backups in your DB System for details about this known issue. To fix the problem, you can follow the procedure in that section or simply update your DB system and database with the latest bundle patch.

Changes to the Site Profile File (glogin.sql)

Customizing the site profile file (`$ORACLE_HOME/sqlplus/admin/glogin.sql`) can cause managed backups to fail in Oracle Cloud Infrastructure. In particular, interactive commands can lead to backup failures. Oracle recommends that you not modify this file for databases hosted in Oracle Cloud Infrastructure.

Database Issues

An improper database state or configuration can lead to failed backups.

Database Not Running During Backup

The database must be active and running while the backup is in progress.

To check that the database is active and running

Use the following command to check the state of your database, and ensure that any problems that might have put the database in an improper state are resolved:

```
srvctl status database -d <db_unique_name> -verbose
```

The system returns a message including the database's instance status. The instance status must be **Open** for the backup to succeed. If the database is not running, use the following command to start it:

```
srvctl start database -d <db_unique_name> -o open
```

If the database is mounted but does not have the **Open** status, use the following commands to access the SQL*Plus command prompt and set the status to **Open**:

```
sqlplus / as sysdba
```

```
alter database open;
```

ARCHIVING MODE SET TO NOARCHIVELOG

When you provision a new database, the archiving mode is set to `ARCHIVELOG` by default. This is the required archiving mode for backup operations. Check the archiving mode setting for the database and change it to `ARCHIVELOG`, if applicable.

To check and set the archiving mode

Open an SQL*Plus command prompt and enter the following command:

```
select log_mode from v$database;
```

If you need to set the archiving mode to `ARCHIVELOG`, start the database in **Mount** status (and not **Open** status), and use the following command at the SQL*Plus command prompt:

```
alter database archivelog;
```

Be sure to confirm that the `db_recovery_file_dest` parameter points to `+RECO`, and that the `log_archive_dest_1` parameter is set to `USE_DB_RECOVERY_FILE_DEST`.

For RAC databases, one instance must have the **Mount** status when enabling archivelog mode. To enable archivelog mode for a RAC database, perform the following steps:

1. Shutdown all database instances:

```
srvctl stop database -d
```

2. Start one of the database instances in mount state:

```
srvctl start instance -d <db_unique_name> -i <instance_name> -o mount
```

3. Access the SQL*Plus command prompt:

```
sqlplus / as sysdba
```

4. Enable archive log mode:

```
alter database archivelog;
```

```
exit;
```

5. Stop the database:

```
srvctl stop instance -d <db_unique_name> -i <instance_name>
```

6. Re-start all database instances:

```
srvctl start database -d <db_unqiue_name>
```

7. At the SQL*Plus command prompt, confirm the archiving mode is set to `ARCHIVELOG`:

```
select log_mode from v$database;
```

Stuck Database Archiver Process and Backup Failures

Backups can fail when the database instance has a stuck archiver process. For example, this can happen when the flash recovery area (FRA) is full. You can check for this condition using the `srvctl status database -db <db_unique_name> -v` command. If the command returns the following output, you must resolve the stuck archiver process issue before backups will succeed:

```
Instance <instance_identifier> is running on node *<node_identifier>. Instance status: Stuck Archiver
```

Refer to ORA-00257:Archiver Error (Doc ID 2014425.1) for information on resolving a stuck archiver process.

After resolving the stuck process, the command should return the following output :

```
Instance <instance_identifier> is running on node *<node_identifier>. Instance status: Open
```

If the instance status does not change after you resolve the underlying issue with the device or resource being full or unavailable, try one of the following workarounds:

- Restart the database using the `srvctl` command to update the status of the database in the clusterware
- Upgrade the database to the latest patchset levels

TEMPORARY TABLESPACE ERRORS

If fixed table statistics are not up to date on the database, backups can fail with errors referencing temporary tablespace present in the `dcs-agent.log` file. For example:

```
select status from v$rman_status where COMMAND_ID=<backup_id>

ERROR at line 1:
ORA-01652: unable to extend temp segment by 128 in tablespace TEMP
```

Gather your fixed table statics as follows to resolve this issue:

```
conn / as sysdba

exec dbms_stats.gather_fixed_objects_stats();
```

RMAN CONFIGURATION AND BACKUP FAILURES

Editing certain RMAN configuration parameters can lead to backup failures in Oracle Cloud Infrastructure. To check your RMAN configuration, use the `show all` command at the RMAN command line prompt.

See the following list of parameters for details about RMAN the configuration settings that should not be altered for databases in Oracle Cloud Infrastructure.

RMAN configuration settings that should not be altered

```
CONFIGURE RETENTION POLICY TO RECOVERY WINDOW OF 30 DAYS;

CONFIGURE CONTROLFILE AUTOBACKUP ON;

CONFIGURE DEVICE TYPE 'SBT_TAPE' PARALLELISM 5 BACKUP TYPE TO COMPRESSED BACKUPSET;

CONFIGURE CHANNEL DEVICE TYPE DISK MAXPIECESIZE 2 G;

CONFIGURE CHANNEL DEVICE TYPE 'SBT_TAPE' MAXPIECESIZE 2 G FORMAT   '%d_%I_%U_%T_%t' PARMS  'SBT_

```

RMAN Retention Policy and Backup Failures

The RMAN retention policy configuration can be the source of backup failures. Using the REDUNDANCY retention policy configuration instead of the RECOVERY WINDOW policy can lead to backup failures. Be sure to use the RECOVERY WINDOW OF 30 DAYS configuration.

To configure the RMAN retention policy setting

1. Find the database ID using the following command:

   ```
   dbcli list-databases
   ```

2. Find the `BackupConfigId` value for the database using the following command:

   ```
   dbcli describe-database -i <database_id>
   ```

3. Update the retention policy configuration to `RECOVERY WINDOW OF 30 DAYS`:

   ```
   dbcli update-backupconfig -i <backup_config_id> --recoverywindow 30
   ```

Loss of Objectstore Wallet File and Backup Failures

RMAN backups fail when an objectstore wallet file is lost. The wallet file is necessary to enable connectivity to the object store.

To confirm that the objectstore wallet file exists and has the correct permissions

1. Find the database ID using the following command:

   ```
   dbcli list-databases
   ```

2. Find the `BackupConfigId` value for the database using the following command:

   ```
   dbcli describe-database -i <database_id>
   ```

3. Find the `BackupLocation` value for the database using the following command:

   ```
   dbcli describe-backupconfig <backup_config_id>
   ```

4. Find the file path of the backup config parameter file (`opc_<backup_location_value>_BC.ora`) using the following command:

   ```
   locate opc_<backup_location_value>_BC.ora
   ```

   For example:

   ```
   [root@orcl 13aef284-9d6b-4eb6-8751-2988aexample]# locate opc_b9naijWMAXzi9example_BC.ora

   /opt/oracle/dcs/commonstore/objectstore/opc_pfile/13aef284-9d6b-4eb6-8751-2988a9example/opc_
   b9naijWMAXzi9example_BC.ora
   ```

5. Find the file path to the wallet file in the backup config parameter file by inspecting the value stored in the `OPC_WALLET` parameter. To do this, navigate to the directory containing the backup config parameter file and use the following `cat` command:

   ```
   cat <backup_config_parameter_file>
   ```

   For example:

```
[root@orcl 13aef284-9d6b-4eb6-8751-2988aexample]# cat opc_b9naijWMAXzi9example_BC.ora
OPC_HOST=https://swiftobjectstorage.us-ashburn-1.oraclecloud.com/v1/dbbackupiad
OPC_WALLET='LOCATION=file:/opt/oracle/dcs/commonstore/objectstore/wallets/13aef284-9d6b-4eb6-
8751-2988aexample CREDENTIAL_ALIAS=alias_opc'
OPC_CONTAINER=b9naijWMAXzi9example
```

6. Confirm that the `cwallet.sso` file exists in the directory specified in the `OPC_WALLET` parameter, and confirm that the file has the correct permissions. The file permissions should have the octal value of "600" (`-rw-------`). Use the following command:

   ```
   ls -ltr /opt/oracle/dcs/commonstore/objectstore/wallets/<backup_config_id>
   ```

   For example:

   ```
   [root@orcl 13aef284-9d6b-4eb6-8751-2988aexample]# ls -ltr
   /opt/oracle/dcs/commonstore/objectstore/wallets/13aef284-9d6b-4eb6-8751-2988aexample

   total 4

   -rw------- 1 oracle oinstall    0 Apr 20 06:45 cwallet.sso.lck

   -rw------- 1 oracle oinstall 1941 Apr 20 06:45 cwallet.sso
   ```

TDE Wallet and Backup Failures

Incorrect TDE Wallet Location Specification

For backup operations to work, the `$ORACLE_HOME/network/admin/sqlnet.ora` file must contain the ENCRYPTION_WALLET_LOCATION parameter formatted exactly as follows:

```
ENCRYPTION_WALLET_LOCATION=(SOURCE=(METHOD=FILE)(METHOD_DATA=
(DIRECTORY=/opt/oracle/dcs/commonstore/wallets/tde/$ORACLE_UNQNAME)))
```

Important

In this wallet location entry, `$ORACLE_UNQNAME` is an environment variable and should not be replaced with an actual value.

To check the TDE wallet location specification

Use the `cat` command to check the TDE wallet location specification. For example:

```
[oracle@orcl tde]$ cat $ORACLE_HOME/network/admin/sqlnet.ora

ENCRYPTION_WALLET_LOCATION=(SOURCE=(METHOD=FILE)(METHOD_DATA=
(DIRECTORY=/opt/oracle/dcs/commonstore/wallets/tde/$ORACLE_UNQNAME)))
```

INCORRECT STATE OF THE TDE WALLET

Database backups fail if the TDE wallet is not in the proper state. The following scenarios can cause this problem:

The ORACLE_UNQNAME environment variable was not set when the database was started using SQL*Plus

If the database was started using SQL*Plus, and the `ORACLE_UNQNAME` environment variable was not set, the wallet is not opened correctly.

To fix the problem, start the database using the `srvctl` utility:

```
srvctl start database -d <db_unique_name>
```

A pluggable database was added with an incorrectly configured master encryption key

In a multitenant environment, each pluggable database (PDB) has its own master encryption key, which is stored in a single keystore used by all containers. After you create or plug in a new PDB, you must create and activate a master encryption key for it. If you do not do so, the `STATUS` column in the `v$encryption_wallet` view shows the value `OPEN_NO_MASTER_KEY`.

To check the master encryption key status and create a master key, do the following:

1. Review the the `STATUS` column in the `v$encryption_wallet` view, as shown in the following example:

```
SQL> alter session set container=pdb2;

Session altered.

SQL> select WRL_TYPE,WRL_PARAMETER,STATUS,WALLET_TYPE from v$encryption_wallet;

WRL_TYPE        WRL_PARAMETER                                          STATUS
WALLET_TYPE

--------------- ------------------------------------------------------ ------------------ ------
---

FILE            /opt/oracle/dcs/commonstore/wallets/tde/example_iadxyz/ OPEN_NO_MASTER_KEY
AUTOLOGIN
```

2. Confirm that the PDB is in READ WRITE open mode and is not restricted, as shown in the following example:

```
SQL> show pdbs

CON_ID CON_NAME     OPEN MODE              RESTRICTED

------ ------------ ---------------------- ---------------

2      PDB$SEED     READ ONLY              NO

3      PDB1         READ WRITE             NO

4      PDB2         READ WRITE             NO
```

   The PDB cannot be open in restricted mode (the `RESTRICTED` column must show `NO`). If the PDB is currently in restricted mode, review the information in the PDB_PLUG_IN_VIOLATIONS view and resolve the issue before continuing. For more information on the PDB_PLUG_IN_VIOLATIONS view and the restricted status, review the documentation on pluggable database for your Oracle database version.

3. Run the following `DBCLI` commands to change the status to `OPEN`:

```
$ sudo su -
 # dbcli list-database
 # dbcli update-tdekey -i <database_ID> -n <PDB_name> -p
```

The `update-tdekey` command shown will prompt you for the admin password.

a. Confirm that the status of the wallet has changed from OPEN_NO_MASTER_KEY to OPEN by querying the `v$encryption_wallet` view as shown in step 1.

INCORRECT CONFIGURATION RELATED TO THE TDE WALLET

Several configuration parameters related to the TDE wallet can cause backups to fail.

To check configuration related to the TDE wallet

- Check that the environment's database unique name parameter (ORACLE_UNQNAME) is set correctly using the following command:

```
srvctl getenv database -d <db_unique_name>
```

For example:

```
[oracle@orcl tde]$ srvctl getenv database -d orclbkp_iadxyz

orclbkp_iadxyz:

ORACLE_UNQNAME=orclbkp_iadxyz

TZ=UTC
```

- Check your `sqlnet.ora` settings to confirm that the file has an ENCRYPTION_WALLET_LOCATION parameter with the correct DIRECTORY value. Use the following command: `cat $ORACLE_HOME/network/admin/sqlnet.ora`

For example:

```
[oracle@orcl tde]$ cat $ORACLE_HOME/network/admin/sqlnet.ora

ENCRYPTION_WALLET_LOCATION=(SOURCE=(METHOD=FILE)(METHOD_DATA=
(DIRECTORY=/opt/oracle/dcs/commonstore/wallets/tde/$ORACLE_UNQNAME)))
```

- Confirm that the wallet status is **open** and the wallet type is **auto login** by checking the `v$encryption_wallet` view. For example:

```
SQL> select status, wrl_parameter,wallet_type from v$encryption_wallet;
```

```
STATUS                         WRL_PARAMETER                                              WALLET_TYPE

------------------------------ ---------------------------------------------------------- ------------
--------

OPEN                           /opt/oracle/dcs/commonstore/wallets/tde/example_iadxyz/ AUTOLOGIN
```

For pluggable databases (PDBs), be sure that you switch to the appropriate container before querying `v$encryption_wallet` view. For example:

```
[oracle@paulo ~]$ sqlplus / as sysdba

SQL> alter session set container=pdb1;

Session altered.

SQL> select WRL_TYPE,WRL_PARAMETER,STATUS,WALLET_TYPE from v$encryption_wallet;

WRL_TYPE   WRL_PARAMETER                                          STATUS     WALLET_TYPE

---------- ------------------------------------------------------ ---------- -------------------
--

FILE       /opt/oracle/dcs/commonstore/wallets/tde/tiger_iad3c8/     OPEN      AUTOLOGIN
```

MISSING TDE WALLET FILE

The TDE wallet file (`ewallet.p12`) can cause backups to fail if it is missing, or if it has incompatible file system permissions or ownership. Check the file as shown in the following example:

```
[oracle@orcl tde]$ ls -ltr /opt/oracle/dcs/commonstore/wallets/tde/$ORACLE_UNQNAME/ewallet.p12

-rwx------ 1 oracle oinstall 5680 Apr 18 13:09 /opt/oracle/dcs/commonstore/wallets/tde/orclbkp_
iadxzy/ewallet.p12
```

The TDE wallet file should have file permissions with the octal value "700" (`-rwx------`), and the owner of this file should be a part of the `oinstall` operating system group.

MISSING AUTO LOGIN WALLET FILE

The auto login wallet file (`cwallet.sso`) can cause backups to fail if it is missing, or if it has incompatible file system permissions or ownership. Check the file as shown in the following example:

```
[oracle@orcl tde]$ ls -ltr /opt/oracle/dcs/commonstore/wallets/tde/$ORACLE_UNQNAME/cwallet.sso

-rwx------ 1 oracle oinstall 5725 Apr 18 13:09 /opt/oracle/dcs/commonstore/wallets/tde/orclbkp_
iadxyz/cwallet.sso
```

The auto login wallet file should have file permissions with the octal value "700" (`-rwx------`), and the owner of this file should be a part of the `oinstall` operating system group.

Other Causes of Backup Failures

UNMOUNTED COMMONSTORE MOUNT POINT

The mount point `/opt/oracle/dcs/commonstore` must be mounted, or backups will fail.

To check the commonstore mount point

Confirm that the mount point `/opt/oracle/dcs/commonstore` is mounted, as shown in the following example:

```
[root@orcl ~]# srvctl config filesystem -volume commonstore -diskgroup data

Volume device: /dev/asm/commonstore-5

Diskgroup name: data

Volume name: commonstore

Canonical volume device: /dev/asm/commonstore-5

Accelerator volume devices:

Mountpoint path: /opt/oracle/dcs/commonstore

Mount point owner: oracle
```

```
Mount users:

Type: ACFS
```

To confirm that ora.data.commonstore.acfs is online

The state for ora.data.commonstore.acfs must be online, or backups will fail. Confirm as shown in the following example:

```
[root@orcl ~]# crsctl stat resource ora.data.commonstore.acfs -v

NAME=ora.data.commonstore.acfs

TYPE=ora.acfs.type

LAST_SERVER=orcl

STATE=OFFLINE

TARGET=OFFLINE
...

STATE_DETAILS=admin unmounted /opt/oracle/dcs/commonstore

...

[root@orcl ~]# ls -ltr /opt/oracle/dcs/commonstore

total 0
```

If the STATE_DETAILS value is `unmounted`, mount the file system as shown in the following example:

```
[root@orcl ~]# srvctl start filesystem -volume commonstore -diskgroup data
```

Confirm that the change was successful as shown in the following example:

```
[root@orcl ~]# crsctl stat resource ora.data.commonstore.acfs -v

NAME=ora.data.commonstore.acfs
```

```
TYPE=ora.acfs.type

LAST_SERVER=orcl

STATE=ONLINE on orcl

TARGET=ONLINE

CARDINALITY_ID=ONLINE

...

STATE_DETAILS=mounted on /opt/oracle/dcs/commonstore
```

List the contents of the `commonstore` directory to confirm that it is mounted, as shown in the following example:

```
[root@orcl ~]# ls -ltr /opt/oracle/dcs/commonstore

total 220

drwx------ 2 root   root     65536 Apr 18 10:50 lost+found

drwx------ 3 oracle oinstall 20480 Apr 18 11:02 wallets

drwxr-xr-x 3 root   root     20480 Apr 20 06:41 pkgrepos

drwxr-xr-x 4 oracle oinstall 20480 Apr 20 06:41 objectstore
```

THE DATABASE IS NOT PROPERLY REGISTERED

Database backups fail if the database is not registered with the dcs-agent. This scenario can occur if you manually migrate the database to Oracle Cloud Infrastructure and do not run the `dbcli register-database` command.

To check whether the database is properly registered, review the information returned by running the `srvctl config database` command and the `dbcli list-databases` command. If either command does not return a record of the database, contact Oracle Support Services.

For instructions on how to register the database, refer to the following topics:

- Registering the Database on the DB System
- dbcli register-database

Obtaining Further Assistance

If you were unable to resolve the problem using the information in this topic, follow the procedures below to collect relevant database and diagnostic information. After you have collected this information, contact Oracle Support.

To collect database information for use in problem reports

Use the following commands to collect details about your database. Record the output of each command for reference:

```
dbcli list-databases
```

```
dbcli describe-database -i <database_id>
```

```
dbcli describe-component
```

To collect diagnostic information regarding failed jobs

1. Log on to the host as the root user and navigate to the `/opt/oracle/dcs/bin/` directory.
2. Run the following two commands to generate information about the failed job:

   ```
   dbcli list-jobs |grep -i <dbname>
   ```

   ```
   dbcli describe-job -i <job_ID> -j
   ```

   The *<job_ID>* in the second command should be the ID of the latest failed job reported from the first command.
3. Run the diagnostics collector script to create a zip file with the diagnostic information for Oracle Support Services.

   ```
   diagcollector.py
   ```

This command creates a file named `diagLogs-<timestamp>.zip` in the `/tmp` directory.

To collect DCS agent log files

To collect DCS agent log files, do the following:

1. Log in as opc user.
2. Run the following command:

```
sudo /opt/oracle/dcs/bin/diagcollector.py
```

3. The system returns a message indicating that agent logs are available in a zip file at a specified directory. For example:

```
[opc@prodpr ~]$ sudo /opt/oracle/dcs/bin/diagcollector.py

Log files collected to :/tmp/dcsdiag/diagLogs-1234567890.zip

Logs are being collected to:

/tmp/dcsdiag/diagLogs-1234567890.zip
```

To collect TDE configuration details

1. Run the `srvctl getenv database -d <db_unique_name>` command and record the output for reference.
2. Record the output of the view `v$encryption_wallet`. For example:

```
SQL> select status, wrl_parameter,wallet_type from v$encryption_wallet;

STATUS          WRL_PARAMETER                                          WALLET_TYPE

--------------- ------------------------------------------------------ ---------

OPEN            /opt/oracle/dcs/commonstore/wallets/tde/example_iadxyz/ AUTOLOGIN
```

3. Record the output of the the output of the `ls -ltr <wrl_parameter>` command. For

example:

```
[oracle@patchtst ~]$ ls -ltr /opt/oracle/dcs/commonstore/wallets/tde/example_iadxyz/

total 28

-rw------- 1 oracle asmadmin 2400 May  2 09:42 ewallet_2018050209420381_defaultTag.p12

-rw------- 1 oracle asmadmin 5680 May  2 09:42 ewallet.p12

-rw------- 1 oracle asmadmin 5723 May  2 09:42 cwallet.sso
```

To collect the RMAN backup report file

Generate RMAN Backup Report File using the following command:

```
dbcli create-rmanbackupreport -i <db_id> -w detailed -rn <report_name>
```

For example:

```
[root@patchtst ~]# dbcli create-rmanbackupreport -i 57fvwxyz-9dc4-45d3-876b-5f850example -w detailed -rn
bkpreport1
```

Locate the report file using the `dbcli describe-rmanbackupreport -in <report_name>` command. The location of the report is given in output. For example:

```
[root@patchtst ~]# dbcli describe-rmanbackupreport -in bkpreport1

Backup Report details

----------------------------------------------------------------

ID: b55vwxyz-c49f-4af3-a956-acccdexample

Report Type: detailed

Location: Node patchtst: /opt/oracle/dcs/log/patchtst/rman/bkup/example_iadxyz/rman_list_backup_
detail/2018-05-02/rman_list_backup_detail_2018-05-02_11-46-51.0359.log

Database ID: 57fvwxyz-9dc4-45d3-876b-5f850example
```

```
CreatedTime: May 2, 2018 11:46:38 AM UTC
```

Patching Failures

Patching operations can fail for various reasons. Typically, an operation fails because a database node is down, there is insufficient space on the file system, or the database host cannot access the object store.

This topic includes information to help you determine the cause of the failure and fix the problem. The information is organized into several sections, based on the error condition. If you already know the cause, you can skip to the section with the suggested solution. Otherwise, use the procedure in Determining the Problem to get started.

Determining the Problem

In the Console, you can identify a failed patching operation by viewing the patch history of a DB system or an individual database. A patch that was not successfully applied displays a status of **Failed** and includes a brief description of the error that caused the failure. If the error message does not contain enough information to point you to a solution, you can use the database CLI and log files to gather more data. Then, refer to the applicable section in this topic for a solution.

To identify the root cause of the patching operation failure

1. Log on to the host as the root user and navigate to the `/opt/oracle/dcs/bin/` directory.
2. Determine the sequence of operations performed on the database.

   ```
   dbcli list-jobs
   ```

   Note the last job ID listed with a status other than **Success**.
3. With the job ID you noted from the previous step, use the following command to check the details of that job:

```
dbcli describe-job -i <job_ID> -j
```

Typically, running this command is enough to reveal the root cause of the failure.

4. If you require more information, review the `/opt/oracle/dcs/log/dcs-agent.log` file.
   You can find the job ID in this file by using the timestamp returned by the job report in step 2.

Note

If the patching failure is on a 2-node RAC database, perform steps 3 and 4 on both nodes.

Database Service Agent Issues

Your Oracle Cloud Infrastructure Database makes use of an agent framework to allow you to manage your database through the cloud platform.

Resolving Patching Failures Caused By a Stopped Agent

Occasionally you might need to restart the dcsagent program if it has the status of **stop/waiting** to resolve a patching failure.

To restart the database service agent

1. From a command prompt, check the status of the agent:

```
initctl status initdcsagent
```

2. If the agent is in the **stop/waiting** state, try to restart the agent:

```
initctl start initdcsagent
```

3. Check the status of the agent again to confirm that it has the **start/running** status:

```
initctl status initdcsagent
```

Resolving Patching Failures Caused By an Agent That Needs to Be Updated

Patching can also fail if your agent needs to be updated. The system gives the following error message for this failure:

```
Current DcsAgent version is less than or equal to minimum required version.
```

To resolve this issue, perform the steps in To have Oracle Support update the Oracle Cloud Infrastructure Database service agent.

To have Oracle Support update the Oracle Cloud Infrastructure Database service agent

1. Confirm that the agent (dcsagent) and DCS Admin program (dcsadmin) are running using the following commands:

   ```
   initctl status initdcsagent
   ```

   ```
   initctl status initdcsadmin
   ```

   If these programs are not running, use the following commands to restart them:

   ```
   initctl start initdcsagent
   ```

   ```
   initctl start initdcsadmin
   ```

2. Follow the instructions in Obtaining Further Assistance to collect your DCS agent log files.
3. Contact Oracle Support for assistance with updating the agent.

Object Store Connectivity Issues

Oracle Cloud Infrastructure DB system and database patches are stored in Oracle Cloud Infrastructure Object Storage. Therefore, successful patching operations require connectivity between the DB system host and the Object Storage location from which the patches are downloaded.

To ensure your database host can connect to Oracle Cloud Infrastructure Object Storage

1. Use the following command to verify the host can access Oracle Cloud Infrastructure Object Storage:

   ```
   dbcli describe-latestpatch
   ```

   Example output indicating success:

   ```
   [root@<host> ~]# dbcli describe-latestpatch

   componentType availableVersion
   --------------- --------------------
   gi 12.2.0.1.180417
   gi 12.1.0.2.180417
   gi 18.2.0.0.180417
   db 11.2.0.4.180417
   db 12.2.0.1.180417
   db 12.1.0.2.180417
   db 18.2.0.0.180417
   oak 12.1.2.11.3
   oak 12.2.1.1.0
   ```

   Example output indicating failure:

   ```
   [root@<host> ~]# dbcli describe-latestpatch

   DCS-10032:Resource patch metadata is not found.Failed to download patchmetadata from
   objectstore
   ```

2. If you cannot connect to the object store, refer to Prerequisites for how to configure object store connectivity.

Host and Oracle Clusterware Issues

One or more of the following conditions on the database host can cause patching operations to fail:

Database Node Not Running During the Patching Operation

All nodes of the database must be active and running while a patching operation is in progress, whether you are patching the DB system or the database home. Use the Console to check that the status of each node is AVAILABLE, and start the node, if needed.

The File System Is Full

Patching operations require a minimum of 15 GB of free space in the `/u01` directory on the host file system. Use the `df -h` command on the host to check the available space. If the file system has insufficient space, you can remove old log or trace files to free up space.

The Oracle Clusterware Is Not Running

Oracle Clusterware enables servers to communicate with each other so that they can function as a collective unit. The cluster software program must be up and running on the DB system for patching operations to complete. Occasionally you might need to restart the Oracle Clusterware to resolve a patching failure.

To restart the Oracle Clusterware

1. From command prompt, check the status of Oracle Clusterware:

   ```
   crsctl check crs
   ```

   Example output:

   ```
   [grid@<host> ~]$ crsctl check crs
   CRS-4638: Oracle High Availability Services is online
   CRS-4537: Cluster Ready Services is online
   CRS-4529: Cluster Synchronization Services is online
   CRS-4533: Event Manager is online
   ```

   For more detailed status information, you can run `crsctl stat res -t`.

2. If Oracle Clusterware is not online, try to restart the program:

   ```
   crsctl start crs
   ```

3. Check the status of Oracle Clusterware to confirm that it is online:

   ```
   crsctl check crs
   ```

The Oracle Grid Infrastructure (GI) Is Not Updated

This problem occurs when you try to patch a database before you patch the DB system of that database. The error description indicates that the Oracle Grid Infrastructure must be updated

first. To resolve this issue, patch the DB system to latest available version. After you patch the DB system, you can retry the database patching operation.

To get the current and latest-available GI versions for the DB system, use the following command:

```
dbcli describe-component
```

Database Issues

An improper database state can lead to patching failures.

Database Not Running During the Patching Operation

The database must be active and running for all of the patching tasks to complete. Otherwise, you must run the datapatch task manually.

To check that the database is active and running

Use the following command to check the state of your database, and ensure that any problems that might have put the database in an improper state are resolved:

```
srvctl status database -d <db_unique_name> -verbose
```

The system returns a message including the database instance status. The instance status must be **Open** for the patching operation to succeed.

If the database is not running, use the following command to start it:

```
srvctl start database -d <db_unique_name> -o open
```

If the database is mounted but does not have the **Open** status, use the following commands to access the SQL*Plus command prompt and set the status to **Open**:

```
sqlplus / as sysdba
```

```
alter database open;
```

To run the datapatch task

Before you run the `datapatch` command, ensure that all pluggable databases (PDBs) are open. To open a PDB, you can use SQL*Plus to execute `ALTER PLUGGABLE DATABASE <pdb_name> OPEN READ WRITE;` against the PDB.

```
$ORACLE_HOME/OPatch/datapatch
```

The datapatch command should be run on each database home.

Obtaining Further Assistance

If you were unable to resolve the problem using the information in this topic, follow the procedures below to collect relevant database and diagnostic information. After you have collected this information, contact Oracle Support.

To collect diagnostic information regarding failed jobs

1. Log on to the host as the root user and navigate to the `/opt/oracle/dcs/bin/` directory.
2. Run the following two commands to generate information about the failed job:

   ```
   dbcli list-jobs
   ```

   ```
   dbcli describe-job -i <job_ID> -j
   ```

   The *<job_ID>* in the second command should be the ID of the latest failed job reported from the first command.
3. Run the diagnostics collector script to create a zip file with the diagnostic information for Oracle Support Services.

   ```
   diagcollector.py
   ```

   This command creates a file named `diagLogs-<timestamp>.zip` in the `/tmp` directory.

To collect DCS agent log files

To collect DCS agent log files, do the following:

1. Log in as opc user.
2. Run the following command:

```
sudo /opt/oracle/dcs/bin/diagcollector.py
```

3. The system returns a message indicating that agent logs are available in a zip file at a specified directory. For example:

```
[opc@prodpr ~]$ sudo /opt/oracle/dcs/bin/diagcollector.py

Log files collected to :/tmp/dcsdiag/diagLogs-1234567890.zip

Logs are being collected to:

/tmp/dcsdiag/diagLogs-1234567890.zip
```

To collect Oracle Grid Infrastructure and Database log files

If an Oracle Grid Infrastructure or Oracle Database patch failed, you can find log files for these failures in the following locations:

Oracle Grid Infrastructure

```
$GI_HOME/cfgtoollogs/
```

Oracle Database

```
$ORACLE_HOME/cfgtoollogs/
```

CHAPTER 10 Edge Services

This chapter explains several services that allow you to manage, secure, and maintain your domains and endpoints.

Overview of the DNS Service

The Oracle Cloud Infrastructure Domain Name System (DNS) service lets you create and manage your DNS zones. You can create zones, add records to zones, and allow Oracle Cloud Infrastructure's edge network to handle your domain's DNS queries.

See Supported Resource Records for additional information.

DNS Service Components

The following list describes the components used to build a DNS zone and make it accessible from the internet.

DOMAIN

Domain names identify a specific location or group of locations on the Internet as a whole. A common definition of "domain" is the complete portion of the DNS tree that has been delegated to a user's control. For example, *example.com* or *oracle.com*.

ZONE

A zone is a portion of the DNS namespace. A Start of Authority record (SOA) defines a zone. A zone contains all labels underneath itself in the tree, unless otherwise specified.

LABEL

Labels are prepended to the zone name, separated by a period, to form the name of a subdomain. For example, the "www" section of www.example.com or the "docs" and "us-ashburn-1" sections of docs.us-ashburn-1.oraclecloud.com are labels. Records are associated with these domains.

CHILD ZONE

Child zones are independent subdomains with their own Start of Authority and Name Server (NS) records. The parent zone of a child zone must contain NS records that refer DNS queries to the name servers responsible for the child zone. Each subsequent child zone creates another link in the delegation chain.

RESOURCE RECORDS

A record contains specific domain information for a zone. Each record type contains information called record data (RDATA). For example, the RDATA of an A or AAAA record contains an IP address for a domain name, while MX records contain information about the mail server for a domain. OCI normalizes all RDATA into the most machine readable format. The returned presentation of your RDATA may differ from its initial input. For more information about RDATA, please see Supported DNS Resource Record Types.

DELEGATION

The name servers where your DNS is hosted and managed.

Ways to Access the DNS Service

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide.

To access the Console, you must use a supported browser. You can use the Console link at the top of this page to go to the sign-in page. Enter your tenancy, user name, and your password.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see

Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

DNS Service Capabilities and Limits

The Oracle Cloud Infrastructure DNS service is limited to 1000 zones per account and 25,000 records per zone. Customers with zone and record size needs exceeding these values are encouraged to contact support at support.oracle.com. Zone file uploads are limited to 1 megabyte (MB) in size per zone file. If your zone file is larger than 1 MB, you will need to split the zone file into smaller batches to upload all of the zone information.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies. For more details about policies for DNS, see Details for the DNS Service.

Getting Started with DNS

If you're new to Oracle Cloud Infrastructure DNS, this topic gives guidance on how to proceed.

What is DNS?

The Domain Name System (DNS) translates human-readable domain names to machine-readable IP addresses. A DNS nameserver stores the DNS records for a zone, and responds

with answers to queries against its database. When you type a domain name into your browser, your operating system queries several DNS nameservers until it finds the authoritative nameserver for that domain. The authoritative nameserver then responds with an IP address or other requested record data. The answer is then relayed back to your browser and the DNS record is resolved to the web page.

Creating a Zone

In this step, you will create a zone. A zone holds the trusted DNS records that will reside on Oracle Cloud Infrastructure's nameservers.

To add a zone

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **DNS Zone Management**.
2. Click **Create Zone**.
3. In the **Create Zone** dialog box, choose one of the following methods:
    - **Manual** - Enter the following:
        - **Zone Name**: Enter the name of a zone you want to create. Avoid entering confidential information.
        - **Zone Type**: If you want to control the zone contents directly within Oracle Cloud Infrastructure, select **Primary**. If you want Oracle Cloud Infrastructure to pull zone contents from an external server, select **Secondary** and enter your **Zone Master Server IP** address.
    - **Import** - Drag and drop, select, or paste a valid zone file into the Import Zone File window. The zone is imported as a primary zone. For information about formatting a zone file, see Formatting a Zone File.
4. Click **Submit**.

The system creates and publishes the zone, complete with the necessary SOA and NS records. For more information on adding a record to your zone, see To add a zone record.

Delegating Your Zone

In this step, you will delegate your domain with your registrar. Delegating your domain with your domain's registrar makes your Oracle Cloud Infrastructure hosted zone accessible through the internet.

To delegate a zone

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **DNS Zone Management**.
2. Click the Zone Name for the zone you want to delegate. Zone details and a list of records appear.
3. Use the **Type** sort filter to locate the NS records for your zone.
4. Note the name servers in the RDATA field within each NS record.
5. You can use the noted name servers to change your domain's DNS delegation. Refer to your registrar's documentation for instructions.

Note

Once delegation has completed, allow 24 hours for your delegation to propagate across the internet.

To add a zone record

Tip

There are many record types you can add to your zone, depending on your goals for the zone and its DNS management.

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **DNS Zone Management**.
2. Click the **Zone Name** in which you want to add a record. Zone details and a list of records appear.

Tip

You can use the Zone Name sort filter to list to sort zone names alphanumerically in ascending or descending order.

3. Click **Add Record**.
4. In the **Add Record** dialog box, select a record type from the drop-down list, and then enter the information for the record. Avoid entering confidential information. For more information about record types, see Supported Resource Records.
5. (Optional) Click the **Add Another Record** check box to add multiple records in succession.
6. Click **Submit**.
7. Once your records have been added, click **Publish Changes**.
8. In the confirmation dialog box, click **Publish Changes**.

Common DNS Zone Record Types

For a complete list of records supported by Oracle Cloud Infrastructure DNS, see Supported Resource Records.

A

An address record used to point a hostname to an IPv4 address. For more information about A records, see RFC 1035.

AAAA

An address record used point a hostname at an IPv6 address. For more information about AAAA records, see RFC 3596.

CNAME

A Canonical Name record identifies the canonical name for a domain. For more information about CNAME records, see RFC 1035.

Note

Per RFC 1912, CNAMES cannot be placed at the apex of the zone.

MX

A Mail Exchanger record defines the mail server accepting mail for a domain. MX records must point to a hostname. MX records must not point to a CNAME or IP address. For more information about MX records, see RFC 1035.

TXT

A Text record holds descriptive, human readable text, and can also include non-human readable content for specific uses. It is commonly used for SPF records and DKIM records that require non-human readable text items. For more information about TXT records, see RFC 1035.

Testing DNS Using BIND's dig Tool

Using the Domain Information Groper (dig) command line tool, you can test against the delegation where your domain is hosted, and you will immediately see whether the change took place without accounting for the cache or TTL (Time to Live) that you have configured.

For more information on using dig to test your DNS, see Testing DNS Using BIND'S dig Tool.

Managing DNS Service Zones

The Oracle Cloud Infrastructure DNS service enables you to manage zones and view zone reports within the Console.

Using the Console

MANAGING ZONES AND ZONE RECORDS

To add a zone

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **DNS Zone Management**.
2. Click **Create Zone**.
3. In the **Create Zone** dialog box, choose one of the following methods:
    - **Manual** - Enter the following:
        - **Zone Name**: Enter the name of a zone you want to create. Avoid entering confidential information.
        - **Zone Type**: If you want to control the zone contents directly within OCI, select **Primary**. If you want OCI to pull zone contents from an external server, select **Secondary** and enter your **Zone Master Server IP** address.
    - **Import** - Drag and drop, select, or paste a valid zone file into the Import Zone File window. The zone is imported as a primary zone. For information about formatting a zone file or how to amend a zone file exported from GoDaddy.com, please see Formatting a Zone File.
4. Click **Submit**.

The system creates and publishes the zone, complete with the necessary SOA and NS records. For more information on adding a record to your zone, see To add a zone record.

To update a secondary zone

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **DNS Zone Management**.
2. Click the secondary **Zone Name** you want to update. Zone details and a list of master server IPs appear.

Tip

You can use the Zone Type sort filter to sort zone type alphanumerically in ascending or descending order.

3. Select the checkbox for the Master Server IP you want to update, and then select **Edit** from the **Actions** drop-down menu.
4. Make the needed changes, and then click **Submit**.
5. (Optional) Click **Add Master Server** to add another Master Server IP address.
6. Click **Publish Changes**.
7. In the confirmation dialog box, click **Publish Changes**.

Tip

For OCI to transfer data from your zone, your nameservers must be able to accept a transfer request from the following IP addresses: 208.78.68.65, 204.13.249.65, 2600:2001:0:1::65, 2600:2003:0:1::65

To delete a zone

Warning

Deletion permanently removes a zone from your DNS service.

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **DNS Zone Management**.
2. Select the checkbox for the zone you want to delete.
3. Click **Delete**. The zone is staged for deletion.
4. Click **Publish Changes** to delete the zone.
5. In the confirmation dialog box, click **Publish Changes**.

To add a zone record

Tip

There are many record types you can add to your zone, depending on your goals for the zone and its DNS management.

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **DNS Zone Management**.
2. Click the **Zone Name** in which you want to add a record. Zone details and a list of records appear.

Tip

You can use the Zone Name sort filter to list to sort zone names alphanumerically in ascending or descending order.

3. Click **Add Record**.
4. In the **Add Record** dialog box, select a record type from the drop-down list, and then enter the information for the record. Avoid entering confidential information. For more information about record types, see Supported Resource Records.
5. (Optional) Click the **Add Another Record** check box to add multiple records in succession.
6. Click **Submit**.
7. Once your records have been added, click **Publish Changes**.
8. In the confirmation dialog box, click **Publish Changes**.

To update a zone record

Note

Protected Records

You can change various components of the records within your zones, such as time-to-live (TTL) and

relevant RDATA. However, some records contain information that cannot be changed. A lock symbol indicates a protected record. You can attempt changes to such records through the **Actions** menu, but the system might not permit updates to some fields.

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **DNS Zone Management**.
2. Click the **Zone Name** in which you want to update a record. Zone details and a list of records appear.

Tip

You can use the Zone Name sort filter to sort zone names alphanumerically in ascending or descending order.

3. To help find a record, you can use the following filter options:
   - Enter the name of the record's domain in the **Search** field.
   - To find unpublished records, select the **Staged** check box.
   - To find published records, select the **Unstaged** check box.
   - Use the **Domain**, **TTL**, or **Type** sort filter to sort records.
4. Select the checkbox for the record you want to update, and select **Edit** from the **Actions** drop-down menu.
5. In the **Edit Record** dialog box, make the needed changes, and then click **Submit**.
6. Click **Publish Changes**.
7. In the confirmation dialog box, click **Publish Changes**.

Reverting Changes Before Publishing

You can revert records to their current published state before you publish changes. Once a record has been published, it cannot be reverted. Select the checkbox for the record you want to revert, and then select **Revert** from the **Actions** drop-down menu.

To delete a zone record

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **DNS Zone Management**.
2. Click the **Zone Name** in which you want to delete a record. Zone details and a list of records appear.

Tip

You can use the Zone Name sort filter to sort zone names alphanumerically in ascending or descending order.

3. Select the checkbox for the record you want to delete, and then select **Delete** from the **Actions** drop-down menu.
4. Click **Publish Changes**.
5. In the confirmation dialog box, click **Publish Changes**.

To delegate a zone

To make your Oracle Cloud Infrastructure hosted zone accessible through the internet, you must delegate your domain with your domain's registrar.

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **DNS Zone Management**.
2. Click the Zone Name for the zone you want to delegate. Zone details and a list of records appear.
3. Use the **Type** sort filter to locate the NS records for your zone.
4. Note the name servers in the RDATA field within each NS record.
5. You can use the noted name servers to change your domain's DNS delegation. Refer to your registrar's documentation for instructions.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations to manage your DNS zones:

- GetZone
- ListZones
- CreateZone
- UpdateZone
- DeleteZone
- PatchZoneRecords (add or delete records)
- UpdateZoneRecords

Supported Resource Records

The Oracle Cloud Infrastructure DNS service supports many resource record types. The following list provides a brief explanation of the purpose of each supported record type. Avoid entering confidential information when entering record data. The RFC links direct you to further information about the record types and data structure.

Note About RDATA

OCI normalizes all RDATA into the most machine readable format. The returned presentation of your RDATA may differ from its initial input.

Example:

The RDATA for the ALIAS, CNAME, DNAME, MX, and NS record types may contain one or more absolute domain names. If the specified RDATA for one of these record types does not end in a dot or period to represent the root, the period will be added.

```
www.example.com --> www.example.com.
```

You can use various DNS libraries to normalize your RDATA before input.

Programming Language	Library
Go	DNS Library in Go
Java	dnsjava
Python	dnspython

DNS Resource Record Types

A

An address record used to point a hostname to an IPv4 address. For more information about A records, see RFC 1035.

AAAA

An address record used point a hostname at an IPv6 address. For more information about AAAA records, see RFC 3596.

ALIAS

A private pseudo-record that allows CNAME functionality at the apex of a zone. You can view and read ALIAS records in Oracle Cloud Infrastructure DNS, but you cannot create them.

CAA

A Certification Authority Authorization record allows a domain name holder to specify one or more Certification Authorities authorized to issue certificates for that domain. For more information about CAA records, see RFC 6844.

CDNSKEY

A Child DNSKEY moves a CDNSSEC key from a child zone to a parent zone. The information provided in this record must match the CDNSKEY information for your domain at your other DNS provider. This record is automatically created if you enable DNSSEC on a primary zone in Oracle Cloud Infrastructure DNS. For more information about CDNSKEY, see RFC 7344.

CDS

A Child Delegation Signer record is a child copy of a DS record, for transfer to a parent zone. For more information about CDS records, see RFC 7344.

CERT

A Certificate record stores public key certificates and related certificate revocation lists in the DNS. For more information about CERT records, see RFC 2538 and RFC 4398.

CNAME

A Canonical Name record identifies the canonical name for a domain. For more information about CNAME records, see RFC 1035.

CSYNC

A Child-to-Parent Synchronization record syncs records from a child zone to a parent zone. For more information about CNAME records, see RFC 7477.

DHCID

A DHCP identifier record provides a way to store DHCP client identifiers in the DNS to eliminate potential hostname conflicts within a zone. For more information about DHCID, see RFC 4701.

DKIM

A Domain Keys Identified Mail is a special TXT record set up specifically to supply a public key used to authenticate arriving mail for a domain. For more information about DKIM records, see RFC 6376.

DNAME

A Delegation Name record has similar behavior to a CNAME record, but allows you to map an entire subtree beneath a label to another domain. For more information about DNAME records, see RFC 6672.

DNSKEY

A DNS Key record documents public keys used for DNSSEC. The information in this record must match the DNSKEY information for your domain at your other DNS provider. For more information about DNSKEY records, see RFC 4034.

DS

A Delegation Signer record resides at the top-level domain and points to a child zone's DNSKEY record. DS records are created when DNSSEC security authentication is added to the zone. For more information about DS records, see RFC 4034.

IPSECKEY

An IPSec Key record stores public keys for a host, network, or application to connect to IP security (IPSec) systems. For more information on IPSECKEY records, see RFC 4025.

KEY

A Key record stores a public key that is associated with a domain name. Currently only used by SIG and TKEY records. IPSECKEY and DNSKEY have replaced key for use in IPSec and DNSSEC, respectively. For more information about KEY records, see RFC 4025.

KX

A Key Exchanger record identifies a key management agent for the associated domain name with some cryptographic systems (not including DNSSEC). For more information about KX records, see RFC 2230.

LOC

A Location record stores geographic location data of computers, subnets, and networks within the DNS. For more information about LOC records, see RFC 1876.

MX

A Mail Exchanger record defines the mail server accepting mail for a domain. MX records must point to a hostname. MX records must not point to a CNAME or IP address. For more information about MX records, see RFC 1035.

NS

A Nameserver record lists the authoritative nameservers for a zone. Oracle Cloud Infrastructure DNS automatically generates NS records at the apex of each new primary zone. For more information about NS records, see RFC 1035.

PTR

A Pointer record reverse maps an IP address to a hostname. This behavior is the opposite of an A Record, which forward maps a hostname to an IP address. PTR records are commonly found in reverse DNS zones. For more information about PTR records, see RFC 1035.

PX

A resource record used in X.400 mapping protocols. For more information about PX records, see RFC 822 and RFC 2163.

SOA

A Start of Authority record specifies authoritative information about a DNS zone, including:

- The primary nameserver.
- The email of the domain administrator.

- The domain serial number.
- Several timers relating to refreshing the zone.

The Oracle Cloud Infrastructure DNS automatically generates an SOA record when a zone is created. For more information about SOA records, see RFC 1035.

SPF

A Sender Policy Framework record is a special TXT record used to store data designed to detect email spoofing. For more information about SPF records, see RFC 4408.

SRV

A Service Locator record allows administrators to use several servers for a single domain. For more information about SRV records, see RFC 2782.

SSHFP

An SSH Public Key Fingerprint record publishes SSH public host key fingerprints using the DNS. For more information about SSHFP records, see RFC 6594.

TLSA

A Transport Layer Security Authentication record associates a TLS server certificate, or public key, with the domain name where the record is found. This relationship is called a TLSA certificate association. For more information about TLSA records, see RFC 6698.

TXT

A Text record holds descriptive, human readable text, and can also include non-human readable content for specific uses. It is commonly used for SPF records and DKIM records that require non-human readable text items. For more information about TXT records, see RFC 1035.

How to Format a Zone File

A zone file is a text file that describes a DNS zone. The BIND file format is the industry preferred zone file format and has been widely adopted by DNS server software. The format

is defined in RFC 1035.

Example of an OCI Zone File

This an example of a zone file downloaded from OCI's DNS service.

```
$ORIGIN example.com.
                        @                    3600 SOA   ns1.p30.oraclecloud.net. (
                        zone-admin.dyndns.com.     ; address of responsible party
                        2016072701                 ; serial number
                        3600                       ; refresh period
                        600                        ; retry period
                        604800                     ; expire time
                        1800                     ) ; minimum ttl
                        86400 NS    ns1.p68.dns.oraclecloud.net.
                        86400 NS    ns2.p68.dns.oraclecloud.net.
                        86400 NS    ns3.p68.dns.oraclecloud.net.
                        86400 NS    ns4.p68.dns.oraclecloud.net.
                        3600 MX    10 mail.example.com.
                        3600 MX    20 vpn.example.com.
                        3600 MX    30 mail.example.com.
                        60 A     204.13.248.106
                        3600 TXT   "v=spf1 includespf.oraclecloud.net ~all"
                        mail                  14400 A     204.13.248.106
                        vpn                      60 A     216.146.45.240
                        webapp                   60 A     216.146.46.10
                        webapp                   60 A     216.146.46.11
                www                   43200 CNAME example.com.
```

Note

Record Classes

In the example zone file above, no record classes (IN, CH, HS) are displayed. OCI’s DNS service only works with Internet (IN) class records but omits the class information in zone files for efficiency purposes.

Anatomy of a Zone File

`$ORIGIN` indicates a DNS node tree and will typically start a DNS zone file. Any host labels below the origin will append the origin hostname to assemble a fully qualified hostname. Any host label within a record that uses a fully qualified domain terminating with an ending period will not append the origin hostname.

Example: With `$ORIGIN example.com.`, any record where the host label field is not followed by a period, `example.com`. will be appended to them.

The "@" symbol is a special label that indicates the `$ORIGIN` should replace the "@" symbol. This is typically used for the apex of a zone.

SOA Record – The `$ORIGIN` is followed by the zone's Start Of Authority (SOA) record. An SOA record is required for each zone. It contains the name of the zone, the e-mail address of the party responsible for administering the domain's zone file, the current serial number of the zone, the primary nameserver of the zone, and various timing elements (measured in seconds).

SOA Record Format

```
@     IN     SOA    {primary-name-server}     {hostmaster-email} (
                           {serial-number}
                           {time-to-refresh}
                           {time-to-retry}
                           {time-to-expire}
                      {minimum-TTL} )
```

- **Primary Name Server** – The nameserver that contains the original zone file and not an AXFR transferred copy.
- **Hostmaster Email** – Address of the party responsible for the zone. A period "." is used in place of an "@" symbol. For email addresses that contain a period, this will be escaped with a slash "/".
- **Serial Number** – Version number of the zone. The serial number will increase with each subsequent update to your zone.
- **Time To Refresh** – How long a nameserver should wait prior to checking for a serial number increase within the primary zone file, in seconds. An increased serial number

detected by a secondary DNS nameserver means a transfer is needed to sync your records. Only applies to zones using secondary DNS.

- **Time To Retry** – How long a nameserver should wait prior to retrying to update a zone after a failed attempt, in seconds. Only applies to zones using secondary DNS.
- **Time To Expire** – How long a nameserver should wait prior to considering data from a secondary zone invalid and stop answering queries for that zone, in seconds. Only applies to zones using secondary DNS.
- **Minimum TTL** – Minimum Time To Live (TTL). How long a nameserver or resolver should cache a negative response, in seconds.

Anatomy of a Record Within a Zone File

A zone file is a collection of resource records with each record entry described in the following sequence:

Format:	Host Label	TTL	Record Class	Record Type	Record Data
Example:	example.com.	60	IN	A	104.255.228.125

- **Host Label** – A host label helps to define the hostname of a record and whether the `$ORIGIN` hostname will be appended to the label. Fully qualified hostnames terminated by a period will not append the origin.
- **TTL** – The Time To LIve (TTL) is the amount of time that a DNS record will be cached by an outside DNS server or resolver, in seconds.
- **Record Class** – There are three classes of DNS records: IN (Internet), CH (Chaosnet), and HS (Hesiod). OCI DNS only uses the IN class of records.
- **Record Type** – Where the format of a record is defined.
- **Record Data** – The data within a DNS answer, such as an IP address, hostname, or other information. Different record types will contain different types of record data.

Amending Zone Files Exported from GoDaddy.com for Import

GoDaddy.com exports zone files in a proprietary format. To get the Oracle Cloud Infrastructure DNS service to correctly import a zone file exported from GoDaddy.com, you must directly alter the file. Follow these instructions to update the zone file.

1. Export your zone file from GoDaddy.com. Reference GoDaddy.com's documentation to see how this is done.
2. Open the file in your preferred text editor.
3. Prepend a new line to the file before the SOA record with the following information, including the trailing period: `$ORIGIN [yourdomain].`
4. Once the file has been amended, save the changes to the file and use the zone import function to import the file into your DNS configuration. For more information about zone import, see Managing DNS Zones.

Note

If your zone file includes includes dynamic A records, such as `@ 600 IN A GoCentral Published Site`, you will need to amend these records with the correct IP addresses of your website. Please contact GoDaddy.com for information about how to obtain this information.

Example: `@ 600 IN A 192.0.2.255`

Example:

This is an example of a zone file exported from GoDaddy.com. The code in bold is the code that needs to be removed from the file for it to be eligible for import into Oracle Cloud Infrastructure DNS.

Tip

Placing a semi-colon at the beginning of a line is valid comment syntax for a zone file, per RFC 1035, but for ease of use and formatting it is recommended to remove the large section of comments from the beginning of the zone file provided by GoDaddy.com, as shown below.

```
Domain: example.com
; Exported (y-m-d hh:mm:ss): 2019-01-10 13:05:04
;
; This file is intended for use for informational and archival
; purposes ONLY and MUST be edited before use on a production
; DNS server.
;
; In particular, you must update the SOA record with the correct
; authoritative name server and contact e-mail address information,
; and add the correct NS records for the name servers which will
; be authoritative for this domain.
;
; For further information, please consult the BIND documentation
; located on the following website:
;
; http://www.isc.org/
;
; And RFC 1035:
;
; http://www.ietf.org/rfc/rfc1035.txt
;
; Please note that we do NOT offer technical support for any use
; of this zone data, the BIND name server, or any other third-
; party DNS software.
;
; Use at your own risk.

Testing DNS Using BIND'S dig Tool

Using the Domain Information Groper (dig) command line tool, you can test against the delegation where your domain is hosted, and you will immediately see whether the change took place without accounting for the cache or TTL (Time to Live) that you have configured.

Note

Windows users can download the tool from BIND's website. Use Terminal to access dig on Linux and Macintosh systems.

Using dig

Before using BIND's dig tool, you must access or install dig on your system. Once you have access to dig, you can use dig to test your DNS.

To access dig (Mac)

1. From your Applications folder, open the Utilities folder, and then select **Terminal**.

2. When Terminal is open, type a dig command using a hostname you want to look up.

To Install dig (Windows)

1. Go to BIND's website and download the most current, stable version of BIND.

Note

BIND supports both 32 and 64 bit Windows systems. Confirm which version of Windows you are using and download the correct version of BIND. View Microsoft's documentation to determine which version of Windows you are using.

2. Extract the downloaded file and install BIND in the following directory: **C:\Program Files\ISC BIND 9**. Select the **Tools Only** check box.
3. Once BIND is installed, on the Windows menu open the Control Panel, and then open your System properties.
4. On the **Advanced** tab, click **Environment Variables**.
5. Under **System Variables**, select **Path**, and then click **Edit**.
6. At the end of the path in the Edit System Variable window, add **C:\Program Files\ISC BIND 9\bin**, and then click **OK**.
7. In the Edit Variables window, click **OK**. In the System properties window, click **OK**.

To open the Command Prompt

For Windows versions 8 -10:

1. Click the Windows menu icon.
2. In the **Search** field, type **CMD**.
3. Click **Command Prompt**.

For Windows version 7:

1. On the **Start** menu click **Run**.
2. Enter **CMD**, and then click **OK**.

To use dig to test your DNS

1. Open Terminal (Mac and Linux) or Command Prompt (Windows).
2. Type `dig <any hostname>`, and then press **Enter**.

The following information is returned:

```
$ dig oracle.com

; <<>> DiG 9.10.6 <<>> oracle.com

- **Question section**: The query made to the DNS. In this example, we asked for the first available A record for the hostname, oracle.com.

- **Answer section**: The first available answer for the query made to the DNS. In this example, we received the A record for the IP address 137.254.16.101.
- **Authority section**: The authoritative nameservers from which the answer to the query was received. These nameservers house the zones for a domain.
- **Additional section**: Additional information the resolver may need but not the answer to the query.

DIG COMMANDS

Command	Description	Example
`dig [hostname]`	Returns any A record found within the queried hostname's zone.	`dig oracle.com`
`dig [hostname] [record type]`	Returns the records of that type found within the queried hostname's zone.	`dig oracle.com MX`
`dig [hostname] +short`	Provides a brief answer, usually just an IP address.	`dig oracle.com +short`
`dig @[nameserver address] [hostname]`	Queries the nameserver directly instead of your ISP's resolver.	`dig @dnsmaster6.oracle.com`
`dig [hostname] +trace`	Adding `+trace` instructs dig to resolve the query from the root nameserver downwards and to report the results from each query step.	`dig dyn.com +trace`

Command	Description	Example
`dig -X [IP address]`	Reverse lookup for IP addresses.	`dig -X 137.254.16.101`
`dig [hostname] any`	Returns all records for a hostname.	`dig oracle.com any`

Overview of the Health Checks Service

The Oracle Cloud Infrastructure Health Checks service provides users with high frequency external monitoring to determine the availability and performance of any publicly facing service, including hosted websites, API endpoints, or externally facing load balancers. By using Health Checks, users can ensure that they are immediately aware of any availability issue affecting their customers.

Health Checks Service Components

The following list describes the key components used in creating a health check.

MONITORS

Monitors allow you to continuously monitor the health of public-facing endpoints. You can configure monitors to use either HTTP and ping protocols.

ON-DEMAND PROBES

On-demand probes allow you to execute a one-time probe to assess the health of a public-facing endpoint. You can configure on-demand probes to use either or both HTTP and ping protocols. This feature is currently only available via the REST API.

VANTAGE POINTS

Vantage points are geographic locations from which monitors and probes can be executed to your specified target. Oracle Cloud Infrastructure maintains dozens of vantage points around the world.

PROTOCOLS

The Health Checks service allows you to configure both HTTP and ping type monitors. Each type has respective protocols.

Ways to Access the Health Checks Service

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide.

To access the Console, you must use a supported browser. You can use the Console link at the top of this page to go to the sign-in page. Enter your tenancy, user name, and your password.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Health Checks Service Capabilities and Limits

The Oracle Cloud Infrastructure Health Checks service is limited to 1000 endpoint tests per account.

See Service Limits for a list of applicable limits and instructions for requesting a limit increase.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies. For more details about policies for Health Checks, see Details for the Health Checks Service.

Policy examples:

- To enable all operations on Health Checks for all users in a tenant :

```
Allow any-user to manage health-check-family in tenancy
```

- To enable all operations on Health Checks for all users in a compartment:

```
Allow any-user to manage health-check-family in compartment <Compartment Name>
```

- To enable all operations on Health Checks for a specific user group:

```
Allow group <Your Group Name> to manage health-check-family in compartment <Compartment Name>
```

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Getting Started With the Health Checks API

The Health Checks service allows you to configure and deploy monitors and on-demand probes using the Health Checks API. Use the following guide to learn how to set up monitors and probes, and retrieve their results using the REST API.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Endpoints

The Health Checks API can be accessed via the following endpoints:

- https://healthchecks.ca-toronto-1.oraclecloud.com/20180501
- https://healthchecks.us-ashburn-1.oraclecloud.com/20180501
- https://healthchecks.us-phoenix-1.oraclecloud.com/20180501
- https://healthchecks.eu-frankfurt-1.oraclecloud.com/20180501
- https://healthchecks.uk-london-1.oraclecloud.com/20180501

Available Protocols For Probes and Monitors

You can configure monitors and probes to use HTTP or ping requests. You will need to ensure that the endpoint being monitored is configured to accept the specified protocol.

HTTP - Configure a GET or HEAD request using HTTP/1.1 to test the target for availability. The probe results are returned in JSON and include the HTTP Status Code and DNS lookup, connection and response timings.

HTTPS - Configure an encrypted HTTPS GET or HEAD request to test the availability of any secure hosted target. Defaults to port 443. The probe results are returned in JSON and include the HTTP Status Code and DNS lookup, connection and response timings.

ICMP - Configure an ICMP echo request ping. The results include the round trip time (RTT) latency.

TCP - Configure a TCP handshake to the specified end point. You should be sure to own this endpoint as testing this connection can be costly to the recipient. The results include the round trip time (RTT) latency.

Create A Monitor

Monitors allow you to monitor the health of endpoints over time. The following example shows how to create an HTTPS monitor that checks the health of www.example.com at an interval of every 30 seconds using a GET request.

```
POST /20180501/httpMonitors

                              {
                              "compartmentId":
"ocid1.compartment.oc1..aaaaaaaat7uqcb6zoxvzoga4d4vh4dtweciavepacd3skz56atf3qp73d7fx",
                              "protocol": "HTTPS",
                              "port": 443,
                              "targets": [
                              "www.example.com"
                              ],
                              "timeoutInSeconds": 30,
                              "method": "GET",
                              "displayName": "Example HTTP monitor",
                              "intervalInSeconds": 30
              }
```

Targets can be either hostnames or IP addresses, and the `path` field can be used to specify an optional path, such as www.example.com/project/help.htm. Optionally, you can specify which geographic locations you would like the monitor to launch from by using the `vantagePointNames` field. At least one vantage point must be listed when using this field. For a list of available vantage points, see Vantage Points.

A 200 response will be returned with the successful creation of a probe, and the results of the probe can be retrieved from the URL in the `resultsUrl` field of the response.

```
{
                              "id": "ocid1.httpmonitor.OC2...abuxgljr6l4nepxjkmbtnibwqpu5z24xdvmr7okzoi47wicoflrxh32rwd
                              "compartmentId":
"ocid1.compartment.oc1..aaaaaaacsxgoz7flzmry5dr6scf7xru6lwqpoygqld74npvn5rdj2cv3iiq",
                              "resultsUrl": "https://healthchecks.us-ashburn-
1.oraclecloud.com/20180501/httpProbeResults/ocid1.httpmonitor.OC2...abuxgljr6l4nepxjkmbtnibwqpu5z24xdvm
r7okzoi47wicoflrxh32rwd7a",
                              "targets": [
                              "www.example.com",
                              "www.oracle.com"
                              ],
                              "vantagePointNames": [
                              "ibm-sjc",
                              "aws-dub",
                              "dgo-nyc"
                              ],
                              "protocol": "HTTPS",
                              "timeoutInSeconds": 30,
                              "displayName": "Example Monitor",
                              "intervalInSeconds": 30,
                              "isEnabled": true
               }
```

For more information about creating an HTTP monitor, see CreateHttpMonitor.

Note

You can configure a similar style monitors using TCP or ICMP protocols. For more information, see _ **CreatePingMonitor**.

Create An On-Demand Probe

Probes are one-off health assessments of an endpoint that can be deployed at anytime. The following example shows how to create an on-demand HTTP probe that checks the health of www.example.com with a GET request.

```
POST /20180501/httpProbeResults

{
  "compartmentId":
"ocid1.compartment.oc1..aaaaaaaat7uqcb6zoxvzoga4d4vh4dtweciavepacd3skz56atf3qp73d7fx",
  "protocol": "HTTP",
  "targets": [
      "www.example.com"
  ],
  "timeoutInSeconds": 30,
  "method": "GET"
}
```

Targets can be either hostnames or IP addresses, and the `path` field can be used to specify an optional path, such as www.example.com/project/help.htm. Additionally, you can specify which geographic locations you would like the probe to launch from by using the `vantagePointNames` field. For a list of available vantage points, see Vantage Points.

A 200 response will be returned with the successful creation of a probe, and the results of the probe can be retrieved from the URL in the `resultsUrl` field of the response. It will take a few moments for results to display once the tests have been configured.

```
{
   "id":"ocid1.pingprobe.OC2...abuxgljr6l4nepxjkmbtnibwqpu6y34xdvmr7okzoi47wicoflrxh32rwd9z",
   "compartmentId":"ocid1.compartment.oc1..aaaaaaacsxgoz7flzmry5dr6scf7xru6lwqpoygqld74npvn5rdj2cv3iiq",
   "resultsUrl":"https://healthchecks.us-ashburn-
```

```
1.oraclecloud.com/20180501/pingProbeResults/ocid1.pingprobe.OC2...abuxgljr6l4nepxjkmbtnibwqpu6y34xdvmr7
okzoi47wicoflrxh32rwd9z",
   "targets":[
      "www.example.com"
   ],
   "vantagePointNames":[
      "ibm-sjc",
      "aws-dub",
      "dgo-nyc"
   ],
   "protocol":"ICMP",
   "timeoutInSeconds":30
}
```

For more information about creating a probe, see **CreateOnDemandHttpProbe**.

Note

You can configure similar style probes using TCP or ICMP protocols. For more information, see **CreateOnDemandPingProbe**.

Retrieving Probe And Monitor Results

Probe and monitor results can be retrieved from URL in the `resultsUrl` field of a monitor or probe creation response. It will take a few moments for results to display once the tests have been configured. Results can also be retrieved at anytime using the following methods:

- **ListPingProbeResults** - For monitors or on-demand probes using TCP or ICMP protocols.
- **ListHttpProbeResults** - For monitors or on-demand probes using HTTP protocols.

Retrieving results for an on-demand probe or monitor requires the probe or monitor's configuration ID as a parameter. On-demand probe and configuration IDs are assigned upon their creation and are returned in the id field of the POST response. You can also use the **ListHttpMonitor** method to retrieve a list of currently configured monitors and probes using

HTTP protocols. Use the **ListPingMonitors** method to retrieve a list of currently configured monitors and probes using TCP and ICMP protocols.

The following is an example of results retrieved using `GET /httpProbeResults/{probeConfigurationId}`.

```
{
  "key": "651b9f3a46041cace0530204060ae27e",
  "probeConfigurationId":
"ocid1.httpmonitor.OC2...abuxgljr6l4nepxjkmbtnibwqpu5z24xdvmr7okzoi47wicoflrxh32rwd7a",
  "startTime": 1517323711505,
  "target": "www.example.com",
  "vantagePointName": "dgo-nyc",
  "protocol": "HTTPS",
  "connection": {
    "connectDuration": 114,
    "secureConnectDuration": 99,
    "address": "93.184.216.34",
    "port": 443
    },
  "dns":{
    "domainLookupDuration": 29,
    "addresses": [
      "93.184.216.34",
      "2606:2800:220:1:248:1893:25c8:1946"
      ]
      },
  "statusCode": 200,
  "fetchStart": 1517323711505,
  "domainLookupStart": 1517323711505,
  "domainLookupEnd": 1517323711534,
  "connectStart": 1517323711535,
  "secureConnectionStart": 1517323711550,
  "connectEnd": 1517323711649,
  "requestStart": 1517323711649,
  "responseStart": 1517323711673,
  "responseEnd": 1517323711676,
  "duration": 171,
  "encodedBodySize": 1270,
  "isTimedOut": false,
  "isHealthy": true
}
```

Vantage Points

Vantage points are geographic locations from which monitors and probes can be launched. Oracle Cloud Infrastructure maintains vantage points on the infrastructure of cloud providers around the world, including AWS, IBM, and Azure. The list below is a sampling of the vantage points available. The list of vantage points is dynamic and changes frequently. Use the ListHealthChecksVantagePoints method to return a list of available vantage points.

Provider	Location	Name
Amazon	Singapore	aws-sin
Amazon	Sao Paolo	aws-sao
Amazon	Dublin	aws-dub
Amazon	San Francisco	aws-sfo
Azure	Dublin	azr-dub
Azure	Amsterdam	azr-ams
Azure	Singapore	azr-sin
Azure	Sydney	azr-syd
Digital Ocean	Toronto	dgo-yyz
Digital Ocean	Frankfurt	dgo-fra
Digital Ocean	New York City	dgo-nyc
Digital Ocean	Biratnagar, Nepal	dgo-blr
Google	Taiwan	goo-tpe
Google	Brussels	goo-bru
Google	Council Bluffs, IA	goo-cbf

Provider	Location	Name
Google	Charleston, SC	goo-chs
IBM	San Jose, CA	ibm-sjc
IBM	Tokyo	ibm-hnd
IBM	Dallas, TX	ibm-dfw
IBM	Hong Kong	ibm-hkg
Rack Space	Ashburn, VA	rck-iad
Rack Space	Dallas, TX	rck-dfw
Rack Space	London	rck-lhr
Rack Space	Sydney	rck-syd

Managing Health Checks

The Health Checks service allows you to monitor the health of IP addresses and hostnames, as measured from geographic vantage points of your choosing, using HTTP and ping probes. After configuring a health check, you can view the monitor's results. The results include the location from which the host was monitored, the availability of the endpoint, and the date and time the test was performed.

Using the Console

MANAGING HEALTH CHECKS

To add a health check

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge**

Services and click **Health Checks**.

2. Click **Create Health Check**.
3. In the **Create Health Check** dialog box, enter the following:
    - **Health Check Name**: The name used for the health check. Avoid entering confidential information.
    - **Compartment**: Select the compartment the health check runs in.
    - **Target**: The IP address of the host being monitored. (Optional) Click **+ Add Target** to add multiple targets in succession.
    - **Vantage Point(s)**: Select the location from which the health of the target is monitored. No more than ten vantage points can be added.
    - **Type**: Select the type of request sent to monitor the target.
    - **Protocol**: The network protocol used to interact with your endpoint, such as HTTP protocol, which initializes an HTTP handshake with your endpoint.
    - **Port**: The port for the monitor to look for a connection. The default is port 80. For HTTPS, use port 8080.
    - **Path (Optional)**: The specific path on the target to be monitored.
    - **Header Name**: (Optional) The name displayed in the request header as part of the health check. Avoid entering confidential information.
    - **Header Value**: (Optional) Specifies the data requested by the header. Click **+ Add Header** to add multiple headers in succession.
    - **Method**: Select the HTTP method used for the health check.
    - **Interval**: Select the period of time between health checks of the target.
    - **Timeout**: Select the maximum time to wait for a reply before marking the health check as failed.
    - **Tags**: Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For

more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.

4. Click **Create Health Check**.

The health check is added to the health check list. To view more details, click the health check name. It will take a few moments for results to display once the tests have been configured.

To edit a health check

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Health Checks**.
2. Select the check box for the health check you want to edit.

Tip

To help find a health check, you can enter the name of the health check in the **Search** field.

3. Select **Edit** from the **Actions** drop-down menu.
4. In the Edit Health Check dialog box, make the needed changes, and then click **Edit Health Check**.

To disable a health check

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Health Checks**.
2. Select the check box for the health check you want to disable.

Tip

To help find a health check, you can enter the name of the health check in the **Search** field.

3. Select **Disable** from the **Actions** drop-down menu.

The status of the health check changes to **Disabled** in the health check list.

To duplicate a health check

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Health Checks**.
2. Select the check box for the health check you want to duplicate.
3. Select **Duplicate** from the **Actions** drop-down menu.
4. In the Create Health Check dialog box, make any updates to the duplicated health check, and then click **Create Health Check**.

To delete a health check

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Health Checks**.
2. Select the check box for the health check you want to delete.

Tip

To help find a health check, you can enter the name of the health check in the **Search** field.

3. Select **Delete** from the **Actions** drop-down menu.

4. In the confirmation dialog box, click **Delete**.

To view the history of a health check

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Health Checks**.
2. Click the name of the health check you want to view.

   The Health Check history displays a list of results for the past 90 days.

   Tip

   To help find a result, you can use the **Start Date**, **Start Time**, **End Date**, and **End Time** filter options.

3. Click the drop-down arrow beside the **TimeStamp** to view the monitor result details. You can use the API to download the data.

To manage tags for a health check

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Health Checks**.
2. Click the name of the health check you want to view.
3. Click the **Tags** tab to view or edit the existing tags. Or click **Apply tag(s)** to add new ones.

For more information, see Resource Tags.

Tip

If your health checks are continually failing, please ensure that you have permission to monitor the host and that the ports on the host have been configured to receive traffic from Health Checks.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

- Use the CreateHTTPMonitor operation to create a Health Check monitor that uses the HTTP protocol.
- Use the CreatePingMonitor operation to create a Health Check monitor that uses the ping protocol.
- Use the ListHealthChecksVantagePoints to retrieve a list of available vantage points from which to execute monitors.
- Use the UpdateHttpMonitor operation to update the configuration of an HTTP health check monitor. You can also use this operation to disable an HTTP monitor by setting the `isEnabled` field to `false`.
- Use the UpdatePingMonitor operation to update the configuration of ping health check monitor. You can also use this operation to disable a ping monitor by setting the `isEnabled` field to `false`.
- Use the DeleteHttpMonitor operation to remove an HTTP health check monitor from your setup.
- Use the DeletePingMonitor operation to remove a ping health check monitor from your setup.

- Use the ListHttpProbeResults operation to retrieve the results of an HTTP health check monitor.
- Use the ListPingProbeResults operation to retrieve results of a ping health check monitor.

Overview of the Traffic Management Steering Policies Service

The Oracle Cloud Infrastructure Traffic Management Steering Policies service is a critical component of DNS. Traffic Management Steering Policies enables you to configure policies to serve intelligent responses to DNS queries, meaning different answers (endpoints) may be served for the query depending on the logic the customer defines in the policy. Traffic Management Steering Policies can account for health of answers to provide failover capabilities, provide the ability to load balance traffic across multiple resources, and account for the location where the query was initiated to provide a simple, flexible and powerful mechanism to efficiently steer DNS traffic.

Traffic Management Steering Policies Service Components

The following list describes the components used to build a traffic management steering policy.

STEERING POLICIES

A framework to define the traffic management behavior for your zones. Steering policies contain rules that help to intelligently serve DNS answers.

ATTACHMENTS

Allows you to link a steering policy to your zones. An attachment of a steering policy to a zone occludes all records at its domain that are of a covered record type, constructing DNS responses from its steering policy rather than from those domain's records. A domain can have at most one attachment covering any given record type.

RULES

The guidelines steering policies use to filter answers based on the properties of a DNS request, such as the requests geo-location or the health of your endpoints.

ANSWERS

Answers contain the DNS record data and metadata to be processed in a steering policy.

Ways to Access the Traffic Management Steering Policies Service

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide.

To access the Console, you must use a supported browser. You can use the Console link at the top of this page to go to the sign-in page. Enter your tenancy, user name, and your password.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Traffic Management Steering Policies Service Capabilities and Limits

The Oracle Cloud Infrastructure Traffic Management Steering Policies service is limited to 100 policies and 1,000 attachments per tenant. See Service Limits for a list of applicable limits and instructions for requesting a limit increase.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies. For more details about policies for Traffic Management Steering Policies, see Details for the Traffic Management Steering Policies Service.

Traffic Management Steering Policies API Guide

Traffic Management Steering Policies allows you to build and configure traffic management policies using the Oracle Cloud Infrastructure DNS REST API. Use the following guide to learn how policies are constructed using the REST API.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Traffic Management Steering Policy Components

The following list describes the components used to build a Traffic Management Steering Policy.

STEERING POLICIES

An overall framework to define the traffic management behavior for your zones. Steering policies contain rules that help to intelligently serve DNS answers.

ATTACHMENTS

Allows you to link a steering policy to your zones. An attachment of a steering policy to a zone occludes all records at its domain that are of a covered record type, constructing DNS responses from its steering policy rather than from those domain's records. A domain can have at most one attachment covering any given record type.

RULES

The guidelines steering policies use to filter answers based on the properties of a DNS request, such as the requests geo-location or the health of your endpoints.

ANSWERS

Answers contain the DNS record data and metadata to be processed in a steering policy.

TEMPLATES

Templates are predefined rule sequences that create a policy type and its intended behavior. Example: The `FAILOVER` template determines answers by checking DNS query against a `FILTER` rule first, then the following rules in succession: `HEALTH`, `PRIORITY`, and `LIMIT`. This gives the domain dynamic failover capability. Policies that define the `template` field with any policy other than `CUSTOM`, must follow the rule sequence outlined

for that policy type, otherwise, a `400` status code error will be returned upon policy creation.

CASES

A rule may optionally include a sequence of cases defining alternate configurations for how it should behave during processing for any given DNS query. When a rule has no sequence of cases, it is always evaluated with the same configuration during processing. When a rule has an empty sequence of cases, it is always ignored during processing. When a rule has a non-empty sequence of cases, its behavior during processing is configured by the first matching case in the sequence. A rule case with no `caseCondition` always matches. A rule case with a `caseCondition` matches only when that expression evaluates to true for the given query.

Create Steering Policies Using Templates

The following section explains the rule configuration for each type of steering policy template followed by an example POST request (CreateSteeringPolicy) displaying how to configure each template.

FAILOVER

Failover policies allow you to prioritize the order in which you want answers served in a policy (for example, Primary and Secondary). Oracle Cloud Infrastructure Health Checks are leveraged to determine the health of answers in the policy. If the Primary Answer is determined to be unhealthy, DNS traffic will automatically be steered to the Secondary Answer. Each of the following rules must be defined in the order specified below in the `rules` field of your request body when using a `FAILOVER` template:

Order	Rule	Restrictions	Comments
1	FILTER	• No cases are allowed. • Answer data must be defined in `defaultAnswerData` using the following JSON: `{ "answerCondition": "answer.isDisabled != true", "shouldKeep": true }`	
2	HEALTH	• No cases are allowed.	Only included if `healthCheckMonitorId` is defined for the policy.

Example of a POST /steeringPolicies policy using the `FAILOVER` template:

```
{
  "compartmentId": "ocid1...",
  "displayName": "failover between endpoints",
  "ttl": 30,
  "healthCheckMonitorId": "ocid1...",
  "template": "FAILOVER",
  "answers": [
    {
      "name": "server-primary",
      "rtype": "A",
      "rdata": "192.0.2.1",
      "pool": "primary"
    },
    {
      "name": "server-secondary",
      "rtype": "A",
      "rdata": "192.1.2.1",
      "pool": "secondary"
    }
  ],
```

```
  "rules": [
    {
      "ruleType": "FILTER",
      "defaultAnswerData": [
        {
          "answerCondition": "answer.isDisabled != true",
          "shouldKeep": true
        }
      ]
    },
    {
      "ruleType": "HEALTH"
    },
    {
      "ruleType": "PRIORITY",
      "defaultAnswerData": [
        {
          "answerCondition": "answer.pool == 'primary'",
          "value": 1
        },
        {
          "answerCondition": "answer.pool == 'secondary'",
          "value": 99
        }
      ]
    },
    {
      "ruleType": "LIMIT",
      "defaultCount": 1
    }
  ]
}
```

LOAD_BALANCE

Load Balancer policies allow distribution of traffic across multiple endpoints. Endpoints can be assigned equal weights to distribute traffic evenly across the endpoints or custom weights may be assigned for ratio load balancing. Oracle Cloud Infrastructure Health Checks are leveraged to determine the health of the endpoint. DNS traffic will be automatically distributed to the other endpoints, if an endpoint is determined to be

unhealthy. Each of the following rules must be defined in the order specified below in the `rules` field of your request body when using a `LOAD_BALANCE` template:

Order	Rule	Restrictions	Comments
1	`FILTER`	• No cases are allowed. • Answer data must be defined in `defaultAnswerData` using the following JSON: `{ "answerCondition": "answer.isDisabled != true", "shouldKeep": true }`	
2	`HEALTH`	• No cases are allowed.	Only included if `healthCheckMonitorId` is defined for the policy.

Example of a `POST /steeringPolicies` request body using the `LOAD_BALANCE` template:

```
{
  "compartmentId": "ocid1...",
  "displayName": "Weighted load balance for a set of answers with health checks",
  "ttl": 30,
  "healthCheckMonitorId": "ocid1...",
  "template": "LOAD_BALANCE",
  "answers": [
    {
      "name": "server1",
      "rtype": "A",
      "rdata": "192.0.2.1"
    },
    {
      "name": "server2",
      "rtype": "A",
      "rdata": "198.51.100.1"
    }
```

```
  ],
  "rules": [
    {
      "ruleType": "FILTER",
      "defaultAnswerData": [
        {
          "answerCondition": "answer.isDisabled != true",
          "shouldKeep": true
        }
      ]
    },
    {
      "ruleType": "HEALTH"
    },
    {
      "ruleType": "WEIGHTED",
      "defaultAnswerData": [
        {
          "answerCondition": "answer.name == 'server1'",
          "value": 99
        },
        {
          "answerCondition": "answer.name == 'server2'",
          "value": 1
        }
      ]
    },
    {
      "ruleType": "LIMIT",
      "defaultCount": 1
    }
  ]
}
```

ROUTE_BY_GEO

Geolocation-based steering policies distribute DNS traffic to different endpoints based on the location of the end user. Customers can define geographic regions composed of originating continent, countries or states/provinces (North America) and define a separate endpoint or set of endpoints for each region. Each of the following rules must be defined in

the order specified below in the `rules` field of your request body when using a `ROUTE_BY_GEO` template:

Order	Rule	Restrictions	Comments
1	`FILTER`	• No cases are allowed. • Answer data must be defined in `defaultAnswerData` using the following JSON: `{ "answerCondition": "answer.isDisabled != true", "shouldKeep": true }`	
2	`HEALTH`	• No cases are allowed.	Only included if `healthCheckMonitorId` is defined for the policy.

Example of a `POST /steeringPolicies` request body using the `ROUTE_BY_GEO` template:

```
{
  "compartmentId": "ocid1...",
  "displayName": "Geolocations mapped to answer pools",
  "ttl": 30,
  "healthCheckMonitorId": "ocid1...",
  "template": "ROUTE_BY_GEO",
  "answers": [
    {
      "name": "US Server 1",
      "rtype": "A",
      "rdata": "10.10.10.10",
      "pool": "US"
    },
    {
      "name": "US Server 2",
      "rtype": "A",
      "rdata": "10.10.10.11",
```

```
      "pool": "US"
    },
    {
      "name": "EU Server 1",
      "rtype": "A",
      "rdata": "10.10.1.1",
      "pool": "EU"
    },
    {
      "name": "EU Server 2",
      "rtype": "A",
      "rdata": "10.10.1.2",
      "pool": "EU"
    },
    {
      "name": "rest of world 1",
      "rtype": "A",
      "rdata": "203.0.113.1",
      "pool": "Global"
    },
    {
      "name": "rest of world 2",
      "rtype": "A",
      "rdata": "203.0.113.2",
      "pool": "Global"
    }
  ],
  "rules": [
    {
      "ruleType": "FILTER",
      "defaultAnswerData": [
        {
          "answerCondition": "answer.isDisabled != true",
          "shouldKeep": true
        }
      ]
    },
    {
      "ruleType": "HEALTH"
    },
```

```
{
  "ruleType": "PRIORITY",
  "cases": [
    {
      "caseCondition": "query.client.geoKey in (geoKey '6255149')",
      "answerData": [
        {
          "answerCondition": "answer.pool == 'US'",
          "value": 1
        },
        {
          "answerCondition": "answer.pool == 'EU'",
          "value": 2
        },
        {
          "answerCondition": "answer.pool == 'Global'",
          "value": 3
        }
      ]
    },
    {
      "caseCondition": "query.client.geokey in (geokey '6255148')",
      "answerdata": [
        {
          "answerCondition": "answer.pool == 'EU'",
          "value": 1
        },
        {
          "answerCondition": "answer.pool == 'US'",
          "value": 2
        },
        {
          "answerCondition": "answer.pool == 'Global'",
          "value": 3
        }
      ]
    },
    {
      "answerData": [
        {
```

```
            "answerCondition": "answer.pool == 'Global'",
            "value": 1
          },
          {
            "answerCondition": "answer.pool == 'US'",
            "value": 2
          },
          {
            "answerCondition": "answer.pool == 'EU'",
            "value": 3
          }
        ]
      }
    ]
  },
  {
    "ruleType": "LIMIT",
    "defaultCount": 1
  }
 ]
}
```

For a list of geographic keys to use in the `geokey` field, see Traffic Management Steering Policy geokeys.

ROUTE_BY_ASN

ASN-based steering policies enable you to steer DNS traffic based on Autonomous System Numbers (ASN). DNS queries originating from a specific ASN or set of ASNs can be steered to a specified endpoint. Each of the following rules must be defined in the order specified below in the `rules` field of your request body when using a `ROUTE_BY_ASN` template:

Order	Rule	Restrictions	Comments
1	FILTER	• No cases are allowed. • Answer data must be defined in `defaultAnswerData` using the following JSON: `{ "answerCondition": "answer.isDisabled != true", "shouldKeep": true }`	
2	HEALTH	• No cases are allowed.	Only included if `healthCheckMonitorId` is defined for the policy.

Example of a `POST /steeringPolicies` request body using the `ROUTE_BY_ASN` template:

```
{
  "compartmentId": "ocid1...",
  "displayName": "ASNs mapped to pools",
  "ttl": 30,
  "template": "ROUTE_BY_ASN",
  "answers": [
    {
      "name": "MIT Server",
      "rtype": "A",
      "rdata": "10.10.10.10",
      "pool": "MIT"
    },
    {
      "name": "Google Fiber Server",
      "rtype": "A",
      "rdata": "10.10.1.1",
      "pool": "Google Fiber"
    },
    {
      "name": "Other",
```

```
    "rtype": "A",
    "rdata": "203.0.113.1",
    "pool": "Other"
  }
],
"rules": [
  {
    "ruleType": "FILTER",
    "defaultAnswerData": [
      {
        "answerCondition": "answer.isDisabled != true",
        "shouldKeep": true
      }
    ]
  },
  {
    "ruleType": "PRIORITY",
    "cases": [
      {
        "caseCondition": "query.client.asn == 3",
        "answerData": [
          {
            "answerCondition": "answer.pool == 'MIT'",
            "value": 1
          },
          {
            "answerCondition": "answer.pool == 'Google Fiber'",
            "value": 2
          },
          {
            "answerCondition": "answer.pool == 'Other'",
            "value": 3
          }
        ]
      },
      {
        "caseCondition": "query.client.asn == 16591",
        "answerdata": [
          {
            "answerCondition": "answer.pool == 'Google Fiber'",
```

```
            "value": 1
          },
          {
            "answerCondition": "answer.pool == 'MIT'",
            "value": 2
          },
          {
            "answerCondition": "answer.pool == 'Other'",
            "value": 3
          }
        ]
      },
      {
        "answerData": [
          {
            "answerCondition": "answer.pool == 'Other'",
            "value": 1
          },
          {
            "answerCondition": "answer.pool == 'MIT'",
            "value": 2
          },
          {
            "answerCondition": "answer.pool == 'Google Fiber'",
            "value": 3
          }
        ]
      }
    ]
  },
  {
    "ruleType": "LIMIT",
    "defaultCount": 1
  }
 ]
}
```

ROUTE_BY_IP

IP Prefix-based steering policies enable customers to steer DNS traffic based on the IP Prefix of the originating query. Each of the following rules must be defined in the order

specified below in the `rules` field of your request body when using a `ROUTE_BY_IP` template:

Order	Rule	Restrictions	Comments
1	`FILTER`	• No cases are allowed. • Answer data must be defined in `defaultAnswerData` using the following JSON: `"answer.isDisabled != true",`	`{` `"answerCondition":` `"shouldKeep": true` `}`
2	`HEALTH`	• No cases are allowed.	Only included if `healthCheckMonitorId` is defined for the policy.

Example of a `POST /steeringPolicies` request body using the `ROUTE_BY_IP` template:

```
{
  "compartmentId": "ocid1...",
  "displayName": "IP subnets mapped to answer pools",
  "ttl": 30,
  "template": "ROUTE_BY_IP",
  "answers": [
    {
      "name": "MIT Server",
      "rtype": "A",
      "rdata": "10.10.10.10",
      "pool": "MIT"
    },
    {
      "name": "Google Fiber Server",
      "rtype": "A",
      "rdata": "10.10.1.1",
```

```
      "pool": "Google Fiber"
    },
    {
      "name": "Other",
      "rtype": "A",
      "rdata": "203.0.113.1",
      "pool": "Other"
    }
  ],
  "rules": [
    {
      "ruleType": "FILTER",
      "defaultAnswerData": [
        {
          "answerCondition": "answer.isDisabled != true",
          "shouldKeep": true
        }
      ]
    },
    {
      "ruleType": "PRIORITY",
      "cases": [
        {
          "caseCondition": "query.client.address in (subnet '18.0.0.0/9')",
          "answerData": [
            {
              "answerCondition": "answer.pool == 'MIT'",
              "value": 1
            },
            {
              "answerCondition": "answer.pool == 'Google Fiber'",
              "value": 2
            },
            {
              "answerCondition": "answer.pool == 'Other'",
              "value": 3
            }
          ]
        },
        {
```

```
        "caseCondition": "query.client.address in (subnet '136.32.0.0/11')",
        "answerdata": [
          {
            "answerCondition": "answer.pool == 'Google Fiber'",
            "value": 1
          },
          {
            "answerCondition": "answer.pool == 'MIT'",
            "value": 2
          },
          {
            "answerCondition": "answer.pool == 'Other'",
            "value": 3
          }
        ]
      },
      {
        "answerData": [
          {
            "answerCondition": "answer.pool == 'Other'",
            "value": 1
          },
          {
            "answerCondition": "answer.pool == 'MIT'",
            "value": 2
          },
          {
            "answerCondition": "answer.pool == 'Google Fiber'",
            "value": 3
          }
        ]
      }
    ]
  },
  {
    "ruleType": "LIMIT",
    "defaultCount": 1
  }
 ]
}
```

CUSTOM

Custom policies allow you to create complex policies combining the capabilities of failover, load balancing, geolocation, ASN and IP prefix steering. Custom templates to not require a regimented sequence of rules and it is recommended to contact Oracle Cloud Infrastructure support before creating a custom policy.

Rule Types

FILTER

Uses boolean data associated with answers, keeping answers only if the rule's `shouldKeep` value is `true`.

HEALTH

Utilizes Oracle Cloud Health Check monitors to determine the health of your endpoints and add and remove answers from your policy as needed. A health check monitor must be referenced in a health rule to have an effect on the policy. For more information about Health Checks, see Health Checks.

WEIGHTED

Uses a number between 0 and 255 used to determine how often an answer will be served in relation to other answers. Answers with higher values are more likely to be returned.

PRIORITY

Uses an integer associated with each answer to sort answers from lowest to highest value. Example: An answer with a priority value of 1 would be returned before an answer with a priority value of 10 in the list of answers. Answers that do not have a priority value assigned to them will be moved to the end of the list of answers.

LIMIT

Uses a count property to filter away all but the first answers in the list.

Managing Traffic Management Steering Policies

Policy Types

FAILOVER

Failover policies allow you to prioritize the order in which you want answers served in a policy (for example, Primary and Secondary). Oracle Cloud Infrastructure Health Checks are leveraged to determine the health of answers in the policy. If the Primary Answer is determined to be unhealthy, DNS traffic will automatically be steered to the Secondary Answer.

LOAD BALANCER

Load Balancer policies allow distribution of traffic across multiple endpoints. Endpoints can be assigned equal weights to distribute traffic evenly across the endpoints or custom weights may be assigned for ratio load balancing. Oracle Cloud Infrastructure Health Checks are leveraged to determine the health of the endpoint. DNS traffic will be automatically distributed to the other endpoints, if an endpoint is determined to be unhealthy.

GEOLOCATION STEERING

Geolocation steering policies distribute DNS traffic to different endpoints based on the location of the end user. Customers can define geographic regions composed of originating continent, countries or states/provinces (North America) and define a separate endpoint or set of endpoints for each region.

ASN STEERING

ASN steering policies enable you to steer DNS traffic based on Autonomous System Numbers (ASN). DNS queries originating from a specific ASN or set of ASNs can be steered to a specified endpoint.

IP PREFIX STEERING

IP Prefix steering policies enable customers to steer DNS traffic based on the IP Prefix of the originating query.

Typical Traffic Steering Scenarios

This section describes several typical scenarios for using Traffic Management Steering Policies.

Basic Failover

You can leverage Traffic Management Steering Policies to provide automated failover between primary and secondary servers.

Cloud Migration

Weighted load balancing supports controlled migration from your data center to Oracle Cloud Infrastructure servers. You can steer a small amount of traffic (1%) to your new resources in the cloud to verify everything is working as expected. You can then increase the ratios until you are comfortable with fully migrating all DNS traffic to the cloud.

Load Balancing Across Multiple Servers for Scale

You can configure load balancing pools of multiple servers. Traffic Management Steering Policies can automatically distribute DNS traffic across the set of servers. Health Checks may also be used and traffic will be automatically redirected to healthy servers, if a server is determined to be unhealthy.

Hybrid Environments

Since Traffic Management Steering Policies is an agnostic service, it may be used to not only steer traffic to Oracle Cloud Infrastructure resources, but can also be used to steer traffic to any publicly exposed (internet resolvable) resources, including other cloud providers and enterprise data centers.

Worldwide Geolocation Treatment

You can divide your global users into geographically defined regions (for example, state/province level in NA, country level for rest of world) and steer customers to specified resources based on their location. This helps to ensure global, high performing internet resolution, and supports functions such as ring fencing. For example, keeping traffic from China in China and block traffic outside of China into China.

CANARY TESTING

Leveraging IP Prefix steering, you can configure policies to serve different responses for your internal users versus external users.

ZERO-RATING SERVICES

ASN steering conditional steering based on the originating enterprise, mobile operator or other communications provider in support of various commercial agreements that may be in place. Essentially, preferred ASNs can be directed to free resources, while all other traffic can be directed to paid resources.

Using the Console

MANAGING TRAFFIC MANAGEMENT STEERING POLICIES

To create a Load Balancer policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Traffic Management Steering Policies**.
2. Click **Create Traffic Management Steering Policy**.
3. In the **Create Traffic Management Steering Policy** dialog box, select **Load Balancer**.
4. Enter the following information:
    - **Policy Name:** The unique name that identifies policy.
    - **Policy TTL**: The Time to Live for responses from the steering policy. If not specified, the system will set this value on the steering policy.
    - **Maximum Answer Count**: The maximum number of answers returned for the policy.
    - **Answer(s):** Answer pools contain the group of answers that will be served in response to DNS queries.

- **Name**: A unique name to identify the answer. Avoid entering confidential information.
- **Type**: The record type that will be provided as the answer.
- **RDATA**: A valid domain name or IP address to add as an answer.
- **Weight**: A number between 0 and 255 used to determine how often an answer is served in relation to other answers. Answers with higher values are more likely to be served.
- **Eligible**: Select the check box to indicate that the answer is available within the pool to be used in response to queries. Alternatively, select **Mark pool answers eligible** or **Mark pool answers ineligible** from the **Actions** drop-down menu.

- **Attach Health Check:** Select an existing Health Check to be included as part of the policy, add a new one, or select **None**.
- **Attach Domain(s):** (Optional) The domain name and domain OCID you want to attach to the policy. Additional domains can be added in this section.

5. Click **Create Policy**.

The system creates and publishes the policy.

To create a Failover policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Traffic Management Steering Policies**.
2. Click **Create Traffic Management Steering Policy**.
3. In the **Create Traffic Management Steering Policy** dialog box, select **Failover**.
4. Enter the following information:
   - **Policy Name:** The unique name that identifies policy. Avoid entering confidential information.

- **Policy TTL**: The Time to Live for responses from the steering policy. If not specified, the system will set this value on the steering policy.
- **Maximum Answer Count**: The maximum number of answers returned for the policy. For priority-based policies, the first valid answer is returned.
- **Answer Pool(s):** Answer pools contain the group of answers that will be served in response to DNS queries.
    - **Answer Pool Name**: A user-friendly name for the answer pool, unique within the steering policy. Avoid entering confidential information.
    - **Name**: A unique name to identify the answer. Avoid entering confidential information.
    - **Type**: The record type that will be provided as the answer.
    - **RDATA**: A valid domain name or IP address to add as an answer.
    - **Weight**: A number between 0 and 255 used to determine how often an answer is served in relation to other answers. Answers with higher values are more likely to be served.
    - **Eligible**: Select the check box to indicate that the answer is available within the pool to be used in response to queries. Alternatively, select **Mark pool answers eligible** or **Mark pool answers ineligible** from the **Actions** drop-down menu.
- **Pool Priority**: Failover priority rules specify the priority of answers that are served in a policy. If the primary answer is unavailable, traffic is steered to the next answer in the list.
    - **Pool**: Select the priority in which the answers are served.
- **Attach Health Check**: Select an existing Health Check to be included as part of the policy, add a new one, or select **None**.
- **Attach Domain(s)**: The domain name and domain OCID you want to attach to the policy. Additional domains can be added in this section.

5. Click **Create Policy**.

The system creates and publishes the policy.

To create a Geolocation Steering policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Traffic Management Steering Policies**.
2. Click **Create Traffic Management Steering Policy**.
3. In the **Create Traffic Management Steering Policy** dialog box, select **Geolocation Steering**.
4. Enter the following information:
    - **Policy Name:** The unique name that identifies policy. Avoid entering confidential information.
    - **Policy TTL**: The Time to Live for responses from the steering policy. If not specified, the system will set this value on the steering policy.
    - **Maximum Answer Count**: The maximum number of answers returned for the policy. For priority-based policies, the first valid answer is returned.
    - **Answer Pool(s):** Answer pools contain the group of answers that will be served in response to DNS queries.
        - **Answer Pool Name**: A user-friendly name for the answer pool, unique within the steering policy. Avoid entering confidential information.
        - **Name**: A unique name to identify the answer. Avoid entering confidential information.
        - **Type**: The record type that will be provided as the answer.
        - **RDATA**: A valid domain name or IP address to add as an answer.
        - **Eligible**: Select the check box to indicate that the answer is available within the pool to be used in response to queries. Alternatively, select **Mark pool answers eligible** or **Mark pool answers ineligible** from the **Actions** drop-down menu.

- **Geolocation Steering Rules**: Geolocation steering rules specify the priority of answers that are served in a policy. If the primary answer is unavailable, traffic is steered to the next answer in the list. Additional rules and priorities can be added in this section.
  - **Geolocation**: Select a location that will be used to distribute DNS traffic.
  - **Pool Priority**: Select the priority in which the answers are served.
  - **Global Catch-all**: Adding a global catch-all allows you to specify answer pools for queries that do not match any of the specified rules you have added. Click **Add Global Catch-all** and select the pool priorities.
- **Attach Health Check**: Select an existing Health Check to be included as part of the policy, add a new one, or select **None**.
- **Attach Domain(s)**: The domain name and domain OCID you want to attach to the policy. Additional domains can be added in this section.

5. Click **Create Policy**.

The system creates and publishes the policy.

To create an ASN Steering policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Traffic Management Steering Policies**.
2. Click **Create Traffic Management Steering Policy**.
3. In the **Create Traffic Management Steering Policy** dialog box, select **ASN Steering**.
4. Enter the following information:
   - **Policy Name:** The unique name that identifies policy. Avoid entering confidential information.
   - **Policy TTL**: The Time to Live for responses from the steering policy. If not specified, the system will set this value on the steering policy.

- **Maximum Answer Count**: The maximum number of answers returned for the policy. For priority-based policies, the first valid answer is returned.
- **Answer Pool(s):** Answer pools contain the group of answers that will be served in response to DNS queries.
    - **Answer Pool Name**: A user-friendly name for the answer pool, unique within the steering policy. Avoid entering confidential information.
    - **Name**: A unique name to identify the answer. Avoid entering confidential information.
    - **Type**: The record type that will be provided as the answer.
    - **RDATA**: A valid domain name or IP address to add as an answer.
    - **Eligible**: Select the check box to indicate that the answer is available within the pool to be used in response to queries. Alternatively, select **Mark pool answers eligible** or **Mark pool answers ineligible** from the **Actions** drop-down menu.
- **ASN Steering Rules**: ASN steering rules specify the priority of answers that are served in a policy. If the primary answer is unavailable, traffic is steered to the next answer in the list.
    - **ASN**: Enter an Autonomous System Number (ASN) that will be used to distribute DNS traffic.
    - **Pool Priority**: Select the priority in which the answers are served.
    - **Global Catch-all**: Adding a global catch-all allows you to specify answer pools for queries that do not match any of the specified rules you have added. Click **Add Global Catch-all** and select the pool priorities.
- **Attach Health Check**: Select an existing Health Check to be included as part of the policy, add a new one, or select **None**.
- **Attach Domain(s)**: The domain name and domain OCID you want to attach to the policy. Additional domains can be added in this section.

5. Click **Create Policy**.

The system creates and publishes the policy.

To create an IP Prefix Steering policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Traffic Management Steering Policies**.
2. Click **Create Traffic Management Steering Policy**.
3. In the **Create Traffic Management Steering Policy** dialog box, select **IP Prefix Steering**.
4. Enter the following information:
    - **Policy Name:** The unique name that identifies policy. Avoid entering confidential information.
    - **Policy TTL**: The Time to Live for responses from the steering policy. If not specified, the system will set this value on the steering policy.
    - **Maximum Answer Count**: The maximum number of answers returned for the policy. For priority-based policies, the first valid answer is returned.
    - **Answer Pool(s):** Answer pools contain the group of answers that will be served in response to DNS queries.
        - **Answer Pool Name**: A user-friendly name for the answer pool, unique within the steering policy. Avoid entering confidential information.
        - **Name**: A unique name to identify the answer. Avoid entering confidential information.
        - **Type**: The record type that will be provided as the answer.
        - **RDATA**: A valid domain name or IP address to add as an answer.
        - **Eligible**: Select the check box to indicate that the answer is available within the pool to be used in response to queries. Alternatively, select **Mark pool answers eligible** or **Mark pool answers ineligible** from the **Actions** drop-down menu.

- **IP Prefix Steering Rules**: IP prefix steering rules specify the priority of answers that are served in a policy. If the primary answer is unavailable, traffic is steered to the next answer in the list.
    - **Subnet Address**: Enter a subnet address that will be used to distribute DNS traffic.
    - **Pool Priority**: Select the priority in which the answers are served.
    - **Global Catch-all**: Adding a global catch-all allows you to specify answer pools for queries that do not match any of the specified rules you have added. Click **Add Global Catch-all** and select the pool priorities.
- **Attach Health Check**: Select an existing Health Check to be included as part of the policy, add a new one, or select **None**.
- **Attach Domain(s)**: The domain name and domain OCID you want to attach to the policy. Additional domains can be added in this section.

5. Click **Create Policy**.

The system creates and publishes the policy.

To update a policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Traffic Management Steering Policies**.
2. Click the **Policy Name** you want to update. Policy information and a list of attached domains appear.

Tip

You can use search for a policy by name in the **Search** field. You can also use the **Time Created** sort filter to sort the policies chronologically in ascending or descending order.

3. Click **Edit**.
4. Make the needed changes, and then click **Save**.

To attach a domain to an existing policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Traffic Management Steering Policies**.
2. Click the **Policy Name** you want to update. Policy information and a list of attached domains appear.

Tip

You can use search for a policy by name in the **Search** field. You can also use the **Time Created** sort filter to sort the policies chronologically in ascending or descending order.

3. Click **Add Attached Domain(s)**.
4. In the Add Attached Domain(s) dialog box, enter the domain and select a zone.
5. Click **Submit**.

To edit an attached domain

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Traffic Management Steering Policies**.
2. Click the **Policy Name** you want to update. Policy information and a list of attached domains appear.

Tip

You can use search for a policy by name in the **Search** field. You can also use the **Time Created** sort filter to sort the policies chronologically in ascending or descending order.

3. For the attached domain you want to edit, click the Actions icon (three dots), and then click **Edit Attached Domain**.
4. In the Attached Domain(s) dialog box, enter the domain and select a zone.
5. Click **Save**.

To delete a policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **Traffic Management Steering Policies**.
2. Select the check box for the policy you want to delete.
3. Click **Delete**. The policy is staged for deletion.
4. Click **Publish Changes** to delete the policy.
5. In the confirmation dialog box, click **Publish Changes**.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

For more information about managing steering policies using the API, see Traffic Management Steering Policies API Guide.

Use the following operations to manage your steering policies:

- CreateSteeringPolicy
- ListSteeringPolicies
- GetSteeringPolicy
- UpdateSteeringPolicy
- DeleteSteeringPolicy

Use the following operations to manage your steering policy attachments:

- CreateSteeringPolicyAttachment
- ListSteeringPolicyAttachments
- GetSteeringPolicyAttachment
- UpdateSteeringPolicyAttachment
- DeleteSteeringPolicyAttachment

Traffic Management Steering Policy geokeys

Use these keys as values for the `geokey` fields of `caseConditions` in `ROUTE_BY_GEO` steering policies.

Continent geokeys

Overview of the Web Application Firewall Service

Oracle Cloud Infrastructure Web Application Firewall (WAF) is a cloud-based, Payment Card Industry (PCI) compliant, global security service that protects applications from malicious and unwanted internet traffic. WAF can protect any internet facing endpoint, providing consist rule enforcement across a customer's applications.

WAF provides you with the ability to create and manage rules for internet threats including Cross-Site Scripting (XSS), SQL Injection and other OWASP-defined vulnerabilities. Unwanted bots can be mitigated while tactically allowed desirable bots to enter. Access rules can limit based on geography or the signature of the request.

The global Security Operations Center (SOC) will continually monitor the internet threat landscape acting as an extension of your IT infrastructure.

Web Application Firewall Service Components

WEB APPLICATION FIREWALL POLICY

WAF policies encompass the overall configuration of your WAF service, including origin management, protection rule settings, and bot detection features.

ORIGIN

Your web application's origin host server. An origin must be defined in your WAF policy in order to set up protection rules or other features.

PROTECTION RULES

Protection rules can be configured to either allow, block, or log network requests when they meet the specified criteria of a protection rule. The WAF will observe traffic to your web

application over time and suggest new rules to apply. To view a list of available WAF rules, see Supported Protection Rules.

BOT MANAGEMENT

The WAF service includes several features that allow you to detect and either block or allow identified bot traffic to your web applications. Bot management features include: JavaScript Challenge, CAPTCHA Challenge, and GoodBot whitelists. For more information, see Bot Management.

Ways to Access the WAF Service

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface), command line interface (CLI), or the REST API. Instructions for the Console and API are included in topics throughout this guide.

To access the Console, you must use a supported browser. You can use the Console link at the top of this page to go to the sign-in page. Enter your tenancy, user name, and your password.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Note About The API

The WAF service is powered by the Oracle Cloud Infrastructure Web Application Acceleration and Security (WAAS) API. All WAF related calls must be made using the WAAS API. To create a WAF configuration using the API, you must first create a WAAS policy with a defined origin and domain using the API. For the purposes of access control, you must provide the OCID of the compartment where you want the service to reside. For information about access control and compartments, see Overview of the IAM Service.

WAF Service Capabilities and Limits

The WAF service is limited to 50 policies per tenant. See Service Limits for instructions on requesting a limit increase.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given access in a policy for waas-policy. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

Policy examples:

- To allow a specific user group to manage policies in the WAF:

```
Allow group <GroupName> to manage waas-policy in compartment <CompartmentName>
```

```
Allow group <GroupName> to read waas-work-request in compartment <CompartmentName>
```

- To allow a specific user group to manage certificates in the WAF:

```
Allow group <GroupName> to manage waas-certificate in compartment <CompartmentName>
```

- To allow a specific user group view policies in the WAF

```
Allow group <GroupName> to read waas-policy in tenancy <TenancyName>
```

If you're new to policies, see Getting Started with Policies and Common Policies. For more details about policies for WAF, see Details for the WAF Service.

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Getting Started with WAF

If you're new to Oracle Cloud Infrastructure WAF, this topic gives guidance on how to proceed.

Before You Begin

To begin using the WAF service, you must have the following available if you plan to run your site on HTTPS/443:

- Public certificate for the fully qualified domain name (FQDN) of the application.
- Corresponding private key for the site.
- IP address of the LBaaS or other public facing endpoint of application.
- Ability to update DNS records for the domain.

Securing Your WAF

To secure your WAF, you must configure your servers to accept traffic from the WAF servers. Configure your origin's ingress rules to only accept connections from the following CIDR ranges:

- 192.157.18.0/23
- 205.147.88.0/21
- 192.69.118.0/23
- 198.181.48.0/21
- 199.195.6.0/23

Create a Policy to Route Traffic Through the WAF

To begin, create a policy to route traffic through the WAF without rules enabled. Creating a policy without rules enabled ensures that there are no regressions by having a reverse proxy in front of the application.

To create a policy

1. Select the region and compartment where the policy should be maintained (there is no constraint around the WAF co-existing with Load Balancing or other application resources in Oracle Cloud Infrastructure.
2. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
3. Click **Create WAF Policy**.
4. In the **Create WAF Policy** dialog box, enter the following:
    - **Policy Name:** A unique name for the policy. Avoid entering confidential information.
    - **Domains:**
        - **Primary Domain**: The fully qualified domain name (FQDN) of the application where the policy will be applied.
        - **Additional Domains**: (Optional) Subdomains where the policy will be applied.
    - **WAF Origin:** The host or IP address of the public internet facing application that is being protected by the application.
        - **Origin Name**: A unique name for the origin.
        - **URI** - Enter the public facing endpoint (IPv4 or FQDN) of the application.
        - **HTTPS Port**: The port used for secure HTTP connection. The default port is 443.
        - **HTTP Port**: The HTTP port the origin listens on. The default port is 80.

- **Header(s):** (Optional)
  - **Header Name**: The name displayed in the HTTP request header and the header value that can be added and passed to the origin server with all requests.
  - **Header Value**: Specifies the data requested by the header.

- **Tags**: Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.

5. Click **Create WAF Policy**. The WAF Policy overview appears. Expect the policy to become active within 15 minutes of creation.

Update DNS to Enable WAF

In this step, you update the CNAME for your zone to route requests from internet clients to WAF. Use the following instructions to make this DNS change in the Console. If your DNS setup resides with another provider, refer to their documentation for instructions.

To update the CNAME for your zone

1. In the Policy Information tab of the WAF Policy overview, select the CNAME Target.
2. Copy the CNAME target to your clipboard.
3. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **DNS Zone Management**.
4. Click the Zone Name of the primary domain where you want to update the record. Zone details and a list of records appear.
5. Select the check box for the CNAME record and select **Edit** from the **Actions** drop-down menu.

6. In the **Edit Record** dialog box, update the Target field with the CNAME Target from your clipboard.
7. Click **Submit**.
8. Click **Publish Changes**.
9. In the confirmation dialog box, click **Publish Changes**.

Upload Your Certificate and Key

This step assumes that your site runs on HTTPS/443.

To upload your certificate and key

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of your WAF Policy. The WAF Policy overview appears.
3. Click **Settings**.
4. Click **Edit**.
5. In the **Edit Settings** dialog box, enter the following:
   - **WAF Origin:** Select the name and IP address of the origin.
   - **Enable HTTPS Support:** Select this option so that communications between the browser and web app are encrypted. Enter the following information:
     - **SSL Certificate:** Drag and drop, select, or paste a valid SSL certificate in PEM format. You must also include intermediate certificates (the website certificate must be first). The following is an example:

```
-----BEGIN CERTIFICATE-----
                                                                    <Base64_encoded_certi
                                                                    -----END CERTIFICATE-
                                                                    -----BEGIN CERTIFICAT
                                                                    <Intermediate_Base64_
                                                          -----END CERTIFICATE-----
```

- **Private Key:** Drag and drop, select, or paste a valid private key in PEM format in this field. The private key cannot be protected by a passphrase. The following is an example:

```
-----BEGIN PRIVATE KEY-----
                                                                    <Base64_encoded_priva
                                                  -----END PRIVATE KEY-----
```

- **Self Signed Certificate:** Enable this field when using a self-signed certificate to show an SSL warning in the browser.
- **HTTP to HTTPS Redirect:** When enabled, all HTTP traffic is automatically redirected to HTTPS.

6. Click **Save**. Updates to your WAF policy appear in the list to be published in Unpublished Changes.
7. In the WAF Policy overview, under **Unpublished Changes**, click **View**.
8. In the Unpublished Changes list, click the drop-down arrow beside an unpublished change to review the change.
9. Click **Publish All**.
10. In the Publish Changes dialog box, click **Publish All**.

Test Your Application

In this step, you ensure that requests are being routed to the WAF and that your application continues to function normally with a reverse proxy in the topology.

To test your application

1. Open a browser.
2. Enter the FQDN of the website protected by WAF.
3. Test the functionality of the application.
4. Inspect HTTP Response Headers to see if traffic is flowing through WAF. Some HTTP Response Headers to look for are:

- X-Cdn: Served-By-Zenedge
- Server: ZENEDGE

5. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
6. Click the name of your WAF Policy. The WAF Policy overview appears.
7. Under **Logs**, click **View**. Logs for the WAF policy appear.

Note

You may experience a one-minute delay on logs aggregated and available through the console.

8. Copy the IP address and User-Agent value of your requests to your clipboard. You can use this information when you enable WAF to passively detect for access rules.

Enable WAF to Passively Detect Rules

In this step, you enable WAF to detect protection rules without blocking requests. Enabling WAF to passively detect rules helps you visualize the traffic that may pose a threat to your site and help you tune the WAF to exclude false positives.

To enable WAF to detect protection rules

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to configure rule settings for. The WAF Policy overview appears.
3. Click **Protection Rules**.
4. Use the Protection Rules table to locate the rules you want to detect.

5. Enter the Rule IDs you located from the table into the **Rule ID** filter. For this example, enter **941140** (Cross-Site Scripting) in the **Rule ID** filter.
6. Select **Detect** from the **Actions** drop-down menu for the protection rules you filtered.

To enable WAF to detect access rules

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to configure access rules for. The WAF Policy overview appears.
3. Click **Access Control**.
4. Click **Add Access Rule**.
5. In the Add Access Rule dialog box, enter the following:
    a. **Name:** DetectRequestsFromMySpecificBrowser
    b. **Rule Condition:** Select **IP Address** from the drop-down and enter the IP address you copied to your clipboard while testing your application in the **IP Address** field.
    c. Click **+Additional Condition**.
    d. **Rule Condition:** Select **User Agent is** from the drop-down and enter the agent value you copied to your clipboard while testing your application in the **User Agent Header** field.
    e. **Rule Action:** Select **Detect Only**.

Note

Both the IP Address and the User Agent in the preceding example must match for the rule to be triggered. If a different User Agent is used to test your application, the request will not be detected.

6. Click **Add Access Rule**.
7. Click **Unpublished Changes**.
8. Click **Publish All**.

Test the Rules

When the policy is active, you can test that your rules are detected by WAF.

To initiate requests

1. Use the same browser you used when you tested your application to do the following:
   a. Request the FQDN of your application.
   b. Request the FQDN of your application with the following query parameter appended: `?id=<script>alert("TEST");</script>`.
2. Use a different browser on the same machine and repeat the preceding requests. All requests should go through the application.

To verify that WAF is detecting requests

To verify that WAF is detecting requests identified as a risk:

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.

2. Click the name of the WAF Policy you want to view logs for. The WAF Policy overview appears.
3. Click **Logs**. Logs for the WAF policy appear.
4. Select the **Detect** check box from the **Actions** filter.
5. Verify that there are two entries for the protection rule triggered by the Cross-Site Scripting request and one entry for detecting the User Agent and IP Address.

View Recommendations

To view protection rule recommendations

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to view protection rule recommendations for. The WAF Policy overview appears.
3. Click **Protection Rules**.
4. Click the **Recommendations** tab. This list is generated based on the traffic the WAF detects flowing through the WAF. If nothing appears in this list, keep testing the FQDN of your application and check back later.
5. Select the protection rules with a **Detect** recommended action and then click **Accept Recommendations**.

Tip

You can use the **Recommended Action** filter to locate a recommendation by **Detect**.

Enable WAF to Actively Block Requests

After you verify that requests are being detected, you can start blocking the undesired traffic.

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to configure rule settings for. The WAF Policy overview appears.
3. Click **Protection Rules**.
4. Enter rule ID **941140** in the **Rule ID** filter.
5. (Optional) To search for rules with a Detect action, select the **Detect** check box from the **Rule Action** filter.
6. Select **Block** from the **Actions** drop-down menu for rule ID **941140** and any other protection rules you filtered.
7. Under WAF Policy, click **Unpublished Changes**.
8. Click **Publish All**.
9. In the Publish Changes dialog box, click **Publish All**.
10. Test the rules again by initiating requests. You should get 403 Forbidden errors when testing with the JavaScript on the URL.

Managing WAF Policies

The Oracle Cloud Infrastructure WAF service enables you to create a WAF policy and origin.

Order of Processing

The order in which rules and handlers are processed is:

1. IP Whitelists/Blacklists/Good Bot Whitelists
2. Access Rules
3. JavaScript Challenge
4. Device Fingerprinting Challenge (available in the API)
5. Human Interaction Challenge (available in the API)
6. Captcha Challenge

7. Protection Rules
8. Rate Limiting (available in the API)

Using the Console

CREATE AND MANAGE WAF POLICIES

To create a WAF policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click **Create WAF Policy**.

3. In the **Create WAF Policy** dialog box, enter the following:
    - **Policy Name:** A unique name for the policy. Avoid entering confidential information.
    - **Domains:**
        - **Primary Domain**:The fully qualified domain name (FQDN) of the application where the policy will be applied.
        - **Additional Domains**: (Optional) Subdomains where the policy will be applied.
    - **WAF Origin:** The host or IP address of the public internet facing application that is being protected by the application.
        - **Origin Name**: A unique name for the origin. Avoid entering confidential information.
        - **URI**: The IPv4 address or fully qualified domain name (FQDN) of the origin. The URI can be a full URI, not just a host/IP.
        - **HTTPS Port**: The port used for secure HTTP connection. The default port is 443.
        - **HTTP Port**: The HTTP port the origin listens on. The default port is 80.
        - **Header(s):** (Optional)
            - **Header Name**: The name displayed in the HTTP request header and the header value that can be added and passed to the origin server with all requests.
            - **Header Value**: Specifies the data requested by the header.
    - **Tags**: Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.

4. Click **Create WAF Policy**. The WAF Policy overview appears. You can access Origin Management, Access Control, WAF, Bot Management, Alerts, and any unpublished changes. While the policy is being created, no changes can be made until the process has completed. Expect the policy to become active within 15 minutes of creation.

   A CNAME target is generated for each policy. The CNAME target is a hyphenated version of your FQDN within the Oracle Cloud Infrastructure domain (for example, myapp-mydomain-com.oraclecloud.net).

5. In your DNS zone, update the CNAME record entry with the value of the CNAME target that is generated. This enables traffic to be routed through the WAF before the application. This value is presented soon after you publish your policy the first time on the main page of the policy.

To update a WAF policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to update. The WAF Policy overview appears.

Tip

You can use the Date Created sort filter to sort policies by the date they were created in ascending or descending order.

3. Click **Edit**.
4. In the Edit WAF Policy dialog box, make the needed changes and then click **Save**.

To delete a WAF policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Select the check box for the policy you want to delete.

> **Tip**
>
> You can use the Date Created sort filter to sort policies by the date they were created in ascending or descending order.

3. Click **Delete**.
4. In the confirmation dialog box, click **Delete**.

   The status of the policy changes from **Active** to **Deleting**. Deleted policies are maintained for a short time before they are unavailable in the Console.

To publish changes

Updates to your WAF policy appear in the list to be published in Unpublished Changes. Pending changes do not persist across browser sessions. Once you publish changes, it cannot be edited until changes propagate to the edge nodes.

1. In the WAF Policy overview, click **Unpublished Changes**.
2. In the Unpublished Changes list, click the drop-down arrow beside an unpublished change to review the change.
3. Click **Publish All**.
4. In the Publish Changes dialog box, click **Publish All**.

To manage tags for a WAF policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to view. The WAF Policy overview appears.
3. Click the **Tags** tab to view or edit existing tags. Or click **Apply tag(s)** to add new ones.

For more information, see Resource Tags.

Using the CLI

Open a command prompt and run the following command to get the details of a WAAS policy:

```
oci waas waas-policy get --waas-policy-id <policy_ocid>
```

This can be useful in retrieving the necessary information when opening a ticket with Oracle Cloud Infrastructure support. For more information about how to access and use the CLI, see Command Line Interface (CLI).

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

- CreateWaasPolicy
- GetWaasPolicy
- UpdateWaasPolicy
- DeleteWaasPolicy

Origin Management

An origin is an endpoint (typically an IP address) of the application protected by the WAF. An origin can be an Oracle Cloud Infrastructure load balancer public IP address. A load balancer IP address can be used for high availability to an origin. Multiple origins can be defined, but only a single origin can be active for a WAF.

Note

WAF supports default ports (80 and 443) on origin servers.

You can set HTTP headers for outbound traffic from the WAF to the origin server. These name value pairs are then available to the application.

Securing Your WAF

To secure your WAF, you must configure your servers to accept traffic from the WAF servers. Configure your origin's ingress rules to only accept connections from the following CIDR ranges:

- 192.157.18.0/23
- 205.147.88.0/21
- 192.69.118.0/23
- 198.181.48.0/21
- 199.195.6.0/23

Using the Console

To add an origin to your WAF policy

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to add an origin to. The WAF Policy overview appears.
3. Click **Origin Management**.
4. Click **Add Origin**.

5. In the **Add Origin** dialog box, enter the following:
    - **Origin Name**: A unique name for the origin. Avoid entering confidential information.
    - **URI**: The IPv4 address or fully qualified domain name (FQDN) of the origin. The URI can be a full URI, not just a host/IP.
    - **Set as WAF origin?**: Enable this field to designate this origin as the WAF origin.
    - **HTTPS PORT**: The port used for secure HTTP connection. The default is 443.
    - **HTTP PORT**: The HTTP port the origin listens on. The default is 80.
    - **Header(s)**: (Optional) The name displayed in the HTTP request header and the header value that can be added and passed to the origin server with all requests. Additional headers can be added here.
6. Click **Add Origin**. The origin is added to the Origin Management list. You can now configure WAF rules.

To edit an origin

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to edit the origin for. The WAF Policy overview appears.
3. Click **Origin Management**.
4. In the Origin Management view, select the check box for the origin you want to edit.
5. Click **Edit**.
6. In the Edit Origin dialog box, make the needed changes.
7. Click **Save Origin**.

To delete an origin

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to delete an origin from. The WAF Policy overview appears.
3. Click **Origin Management**.
4. In the Origin Management view, select the check box for the origin you want to delete.
5. Click **Delete**.
6. In the confirmation dialog box, click **Delete**.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

- CreateWaasPolicy
- GetWaasPolicy
- UpdateWaasPolicy To remove an origin from the policy using the API, use the `UpdateWaasPolicy` method and leave the origin field empty upon update.

Each origin has a unique name (key). The name of the origin to be used by the WAF must be referenced in the `wafConfig` portion of the settings. For example, if you have the following origins in your configuration:

```
{

"compartmentId": "ocid1.compartment.oc1..aaaaatsdfssdfsdsdfsgxz",
"lifecycleState": "ACTIVE",
"displayName": "myWAFprotectedApp",
"origins": {
"primaryorigin": {
"httpPort": 80,
"httpsPort": 443,
```

```
                "uri": "67.205.161.231",
                "customHeaders": []
                },

                "secondaryorigin": {
                "httpPort": 80,
                "httpsPort": 443,
                "uri": "54.175.154.7",
                "customHeaders": [
                {
                "name": "OriginHeader",
                "value": "true"
                },
                {
                "name": "OriginHeader2",
                "value": "true"
                }
                ]
        }
```

Then within the `wafConfig`, the origin in use would be referenced by name:

```
                "wafConfig": {
                "deviceFingerprintChallenge": {"isEnabled": false},
                "origin": "secondaryorigin",
                "whitelists": [],
```

In this example, the WAF is actively using `secondaryorigin`.

Bot Management

Bot Management enables you to mitigate undesired bot traffic from your site using CAPTCHA and JavaScript detection tools, while enabling known published bot providers to bypass these controls.

Non-human traffic makes up most of the traffic to sites. Bot Manager is designed to detect and block, or otherwise direct, non-human traffic that may interfere with site operations. The Bot Manager features mitigate bots that conduct content and price scraping, vulnerability scanning, comment spam, brute force attacks, and application-layer DDoS attacks. You can also whitelist good bots.

Warning

When you enable Bot Management, you incur a higher rate on requests to the WAF.

JavaScript Challenge

JavaScript Challenge validates that the client can accept JavaScript with a binary decision. JavaScript Challenge is generally the first level of bot mitigation, but not sufficient with more advanced bot tools, which require more advanced challenges. Additional functionality, like detecting Network Address Translation (NAT) traffic, can mitigate the risk of blocking legitimate user traffic from users behind a shared IP address.

The **Action Threshold** parameter defines the number of requests that fail the challenge before the action is taken. The requests that fail under this threshold are not logged. For example, if you set the JavaScript challenge action to **Block** and the **Action Threshold** to 10, and a client that doesn't accept JavaScript makes 11 requests within the **Action Expire Time**, the first 10 requests will be allowed through to origin (assuming there are no other rules) and logs will show one **Block** entry action taken for the JavaScript Challenge.

CAPTCHA Challenge

If a specific URL should be accessed only by a human, you can control it with CAPTCHA protection. You can customize the comments for the CAPTCHA Challenge for each URL. Bots are kept from accessing protected web application functionality using CAPTCHA images designed to be out of reach of computer vision and OCR technologies.

Good Bot Whitelist

Good Bots provides the list of bots managed by known providers, such as Baidu or Google. You can allow the access from a specific good bot, or block the bot if they serve no business purpose. Allowed good bots from this section are whitelisted.

Whitelisted bots are flagged with a Bypass action in the WAF policy Logs. You can select the **Bypass** check box from the **Action** filter in Logs to search for the traffic allowed from these

rules. Logged good bot events are categorized as a Threat Intelligence Leads log type, however, they are not a threat when the action taken is to Bypass.

The list of good bots on this menu are managed and continuously updated. Additional good bots can be added as a new access control rule in Access Control.

Using the Console

To configure JavaScript Challenge settings

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to configure JavaScript Challenge settings for. The WAF Policy overview appears.
3. Click **Bot Management**.
4. Click **Enable JavaScript Challenge**.
5. In the JavaScript Challenge dialog box, select the **Enable JavaScript Challenge** check box.
6. In the JS Challenge Action section, choose one of the following methods:
    - **Detect Only:** Select this option if you want to be alerted for every matched request.
        - **Set Header for Failed Request:** (Optional) Select this check box to specify an additional HTTP header to requests that fail the challenge.
    - **Block:** Select this option to block requests by returning a response code, error page, or CAPTCHA.
        - **Block Action**: Select the action that will be taken when a matching request is blocked.
        - **Block Response Code:** Select a status code to return in response to blocked requests.
7. Enter the following information:

- **Action Threshold**: Specify the number of failed requests before taking action.
- **Action Expire Time**: Enter the number of seconds between challenges to the same IP address.

8. Click **Save**.

The JavaScript Challenge is added to the list of changes to be published.

To edit JavaScript Challenge settings

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to edit JavaScript Challenge settings for. The WAF Policy overview appears.
3. Click **Bot Management**.
4. Click **Edit JavaScript Challenge**.
5. In the **Edit JavaScript Challenge** dialog box, make the needed changes.
6. Click **Save**.

To add a CAPTCHA Challenge

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to edit CAPTCHA challenge settings for. The WAF Policy overview appears.
3. Click **Bot Management**.
4. Click the **CAPTCHA Challenge** tab.
5. Click **Add CAPTCHA Challenge**.

6. In the Add CAPTCHA Challenge dialog box, enter the following information:
    - **CAPTCHA Title**: Enter the text for the CAPTCHA page title.
    - **CAPTCHA URL Path**: Enter the URL path challenged by CAPTCHA.
    - **Session Duration**: Enter the number of seconds after which the CAPTCHA challenge cannot be resubmitted to the same user.
    - **CAPTCHA Header**: Enter the text that will appear before the CAPTCHA image (for example, "I am not a robot").
    - **Footer Text:** Enter the text that will be shown after the CAPTCHA input box and before the submit button.
    - **Incorrect CAPTCHA Text**: Enter the text that will appear when incorrect text is entered (for example, "The CAPTCHA was incorrect. Please try again.").
    - **Submit button**: Enter the text for the Submit button (for example, "Yes, I am human.").
7. Click **Preview CAPTCHA** to preview the CAPTCHA challenge in a new tab.
8. Click **Add**.

To edit a CAPTCHA Challenge

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to edit CAPTCHA Challenge settings for. The WAF Policy overview appears.
3. Click **Bot Management**.
4. Click the **CAPTCHA Challenge** tab.
5. Select the check box for the CAPTCHA you want to edit.
6. Select **Edit** from the **Actions** drop-down menu.
7. Update the CAPTCHA Challenge and then click **Save**.

To delete a CAPTCHA Challenge

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to delete CAPTCHA Challenge settings for. The WAF Policy overview appears.
3. Click **Bot Management**.
4. Click the **CAPTCHA Challenge** tab.
5. Select the check box for the CAPTCHA Challenge you want to delete.
6. Select **Delete** from the **Actions** drop-down menu.
7. In the Confirm dialog box, click **Delete**.

The deleted CAPTCHA Challenge is added to the list of changes to be published.

To manage the Good Bots Whitelist

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to configure Bot Management for. The WAF Policy overview appears.
3. Click **Bot Management**.
4. Click the **Good Bots Whitelist** tab.
5. Select each bot you want to designate as a good bot.

The designated good bots are added to the list of changes to be published.

To publish changes

Updates to your WAF policy appear in the list to be published in Unpublished Changes. Pending changes do not persist across browser sessions. Once you publish changes, it cannot be edited until changes propagate to the edge nodes.

1. Under WAF Policy, click **Unpublished Changes**.
2. In the Unpublished Changes list, click the drop-down arrow beside an unpublished change to review the change.
3. Click **Publish All**.
4. In the Publish Changes dialog box, click **Publish All**.

To discard changes

Updates to your WAF policy appear in the list to be published in Unpublished Changes.

1. Under WAF Policy, click **Unpublished Changes**.
2. In the Unpublished Changes list, click the drop-down arrow beside an unpublished change to review the change.
3. Select the check box for the change you want to discard.
4. Click **Discard**.
5. In the Discard Change dialog box, click **Discard**.

Using the CLI

You can use the CLI to enable rate limiting, device fingerprinting, and human interaction challenges.

To enable rate limiting

Open a command prompt and run the following command to enable rate limiting:

```
oci waas address-rate-limiting update-waf --is-enabled true  --allowed-rate-per-address 1 --max-delayed-count-per-address 2 --waas-policy-id <policy_ocid>
```

This default rate limit setting will allow one request per second before starting to delay. It will delay for two requests until the traffic falls within the threshold boundaries. It will use the default error response code of 503.

To enable device fingerprinting to detect

Open a command prompt and run the following command to enable device fingerprinting to detect:

```
oci waas device-fingerprint-challenge update --is-enabled true --action DETECT --failure-threshold 2 --
action-expiration-in-seconds 240 --failure-threshold-expiration-in-seconds 600 --max-address-count 2 --
max-address-count-expiration-in-seconds 255 --waas-policy-id <policy_ocid>
```

To enable the human interaction challenge to detect

Open a command prompt and run the following command to enable the human interaction challenge to detect:

```
oci waas human-interaction-challenge update --is-enabled true  --waas-policy-id <policy_ocid>
```

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

- UpdateJsChallenge
- GetJsChallenge
- UpdateCaptchas
- GetCaptchas
- GetDeviceFingerprintChallenge
- UpdateDeviceFingerprintChallenge
- GetHumanInteractionChallenge
- UpdateHumanInteractionChallenge
- GetWafAddressRateLimiting
- UpdateWafAddressRateLimiting

WAF Protection Rules

Protection rules match web traffic to rule conditions and determine the action to be taken when the conditions are met. Protection Rule Settings allow you to define the parameters for enforcement any time a protection rule is matched. Recommendations aid in the optimization of your WAF security profile. The Security Operations team proactively monitors all events to provide recommendations about the action of a specific ruleset. See Supported Protection Rules for additional information.

Using the Console

To apply an action to a protection rule

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to configure rule settings for. The WAF Policy overview appears.
3. Click **Protection Rules**.
4. Click the **Rules** tab.
5. Select the protection rule you want to apply an action to.

Tip

You can use the **Rule ID** or **Rule Action** filters to locate a protection rule.

6. Select one of the following actions from the **Actions** drop-down menu:
   - **Detect**: Matching requests generate an alert and the request is proxied.
   - **Block**: Matching requests are blocked.
   - **Off**: The rule is disabled.

The protection rule action is added to the list to be published.

To edit rule settings

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to configure rule settings for. The WAF Policy overview appears.
3. Click **Protection Rules**.
4. Click the **Rule Settings** tab.
5. Click **Edit Rule Settings**.
6. In the Edit Rule Settings dialog box, enter the following:
    - **Block Action**: The action taken on malicious requests blocked by WAF.
    - **Block Response Code**: Provides information indicating why the request was blocked.
    - **Max Number of Arguments**: The maximum number of arguments allowed in the request. The recommended setting is 255.
    - **Max Length of Argument**: The maximum argument length allowed in the request. The recommended setting is 400.
    - **Max Total Argument Length**: The maximum argument length for all arguments in the request. The recommended setting is 64000.
    - **Recommendations Period**: The period in days to analyze for recommended actions.
    - **Allowed HTTP Methods**: The list of allowed HTTP protocol methods.
7. Click **Save**.

The accepted protection rules are added to the list to be published.

To accept recommendations

Recommendations will begin appearing once sufficient traffic has gone through the WAF to profile the right security posture.

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to configure rule settings for. The WAF Policy overview appears.
3. Click **Protection Rules**.
4. Click the **Recommendations** tab.
5. Select the protection rules you want to accept.

Tip

You can use the **Recommended Action** filter to locate a recommendation by **Detect** or **Block**.

6. Click **Accept Recommendations**.

The accepted protection rules are added to the list to be published.

To publish changes

Updates to your WAF policy appear in the list to be published in Unpublished Changes. Pending changes do not persist across browser sessions. Once you publish changes, it cannot be edited until changes propagate to the edge nodes.

1. Under WAF Policy, click **Unpublished Changes**.
2. In the Unpublished Changes list, click the drop-down arrow beside an unpublished change to review the change.

3. Click **Publish All**.
4. In the Publish Changes dialog box, click **Publish All**.

To discard changes

Updates to your WAF policy appear in the list to be published in Unpublished Changes.

1. Under WAF Policy, click **Unpublished Changes**.
2. In the Unpublished Changes list, click the drop-down arrow beside an unpublished change to review the change.
3. Select the check box for the change you want to discard.
4. Click **Discard**.
5. In the Discard Change dialog box, click **Discard**.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

- GetProtectionRule
- ListProtectionRules
- UpdateProtectionRules
- GetProtectionSettings
- UpdateProtectionSettings
- ListRecommendations
- AcceptRecommendations

Listing and Accepting Protection Rule Recommendations

Use the following operations to get the list of recommended rules:

- ListRecommendations

```
{
   "name": "SQL authentication bypass attempts",
   "action": "OFF",
   "description": "Detects basic SQL authentication bypass attempts.",
   "exclusions": [],
   "key": "981244",
   "tags": "SQL Injections, Recommended"
   },

   {

   "modSecurityRuleIds": [
      "950001",
      "959070",
      "959071",
      "959072",
      "950908",
      "959073"
                              ],

   "name": "Common SQL Injections",
   "action": "OFF",
   "description": "detects common SQL injection attacks",
   "exclusions": [],
   "key": "950001",
   "tags": "SQL Injections, WASCTC, OWASP, A1, PCI, Recommended"

   },
```

Using the key values from the output of the GET call above, you can accept one or more of the recommendations using the following operation passing an array of the keys:

- AcceptRecommendations

Body:

```
[
   “981244”,
```

```
   "950001"
]
```

Protection Rule Specific Settings

Several protection rule settings are settings for specific protection rules.

Setting	Rule ID	Rule Name
Allowed HTTP Methods	911100	Restrict HTTP Request Methods
Max Total Argument Length	960341	Total Arguments Limits
Max Number of Arguments	960335	Number of Arguments Limits
Max Length of Argument	960208	Values Limits

The term "Arguments" refers to either query parameters or body parameters in a PUT/POST request. For instance, if the Max Number of Arguments is 2 and RuleID 960335 is set to BLOCK, any of the following requests would be blocked:

```
GET /myapp/path?query=one&query=two&query=three
```

```
POST /myapp/path with Body {"arg1":"one","arg2":"two","arg3":"three"}
```

```
POST /myapp/path?query=one&query=two with Body {"arg1":"one"}
```

Max Length of Argument is the length of either a name or the value of the argument. **Total Argument Length** refers to the sum of the name and value length.

Exclusions

Sometimes a protection rule can trigger a false positive. You can configure an exception if the request(s) generating the false positive have a particular argument or cookie that can be used to identify that request be excluded from the action normally taken on the rule. Exclusions have to be created through the API. The following exclusion parameters can be used:

Name	Value
REQUEST_COOKIES	Cookie Value
REQUEST_COOKIES_NAMES	Cookie Name (value is irrelevant)
ARGS	Argument (Query Parameter or POST/PUT data)
ARGS_NAMES	Query Parameter Name (value is irrelevant)

EXAMPLE

In this example, a block is applied to WAF Rule 911100 (Restrict HTTP Request Methods) with an exception to allow requests with an argument that contains "passthrough".

```
PUT / waasPolicies /<policy_ocid>/wafConfig/protectionRules
```

With the body:

```
[
 {
       "key":"911100",
       "action":"BLOCK",
       "exclusions":
        [
                {
                 "target":"REQUEST_COOKIES",
                 "exclusions":["yourcompany.com", "Wed, 21 Oct 2015 07:28:00 GMT", "12345", "219ffwef9w0f"]
                },
                {
                                "target":"REQUEST_COOKIES_NAMES",
                                "exclusions":["OAMAuthnCookie", "JSESSIONID", "HCM-PSJSESSIONID"]
                },
                {
                 "target":"ARGS",
                 "exclusions":["passthrough"]
                }
        ]
 }
]
```

This will return a 202 Accepted HTTP status, which means the policy will enter an UPDATING state until changes are provisioned to the edge nodes.

Supported Protection Rules

The Oracle Cloud Infrastructure WAF service supports many protection rule types. The following list provides a brief explanation of the purpose of each protection rule type.

PROTECTION RULES

Rule ID/Key	Name	Description
90001	Filter Profanity	Detects profanity used in request headers and body.
90004	Executable File Upload Attempt	Detects attempts to upload executable files though input forms.
90006	Credit Card Leakage in Request: GSA SmartPay	Detects GSA SmartPay credit card numbers in user input.
90007	Credit Card Leakage in Request: MasterCard	Detects MasterCard credit card numbers in user input.
90008	Credit Card Leakage in Request: Visa	Detects Visa credit card numbers in user input.
90009	Credit Card Leakage in Request: American Express	Detects American Express credit card numbers in user input.
90010	Credit Card Leakage in Request: Diners Club	Detects Diners Club credit card numbers in user input.
90011	Credit Card Leakage in Request: enRoute	Detects enRoute credit card numbers in user input.

Rule ID/Key	Name	Description
90012	Credit Card Leakage in Request: Discover	Detects Discover credit card numbers in user input.
90013	Credit Card Leakage in Request: JCB	Detects JCB credit card numbers in user input.
120123	Joomla! Core CVE-2015-8562 Remote Code Execution Vulnerability Prevention	Detects Joomla! Core CVE-2015-8562 Remote Code Execution Vulnerability payload.
900032	HTTP Parameter Pollution (HPP) Detection	Detects requests that have multiple arguments with the same name indicative of an HPP attack.
911100	Restrict HTTP Request Methods	Allows only request methods specified by the configurable "Allowed http methods" parameter.
920100	Invalid HTTP Request Line	Detects an invalid HTTP request line.
920280	Missing/Empty Host Header	Detects a missing/empty host header.
920350	Invalid HTTP Request Line	Detects invalid HTTP request lines.
941100	Cross-Site Scripting (XSS) Attempt: Libinjection - XSS Detection	Detects XSS Libinjection attempt.
941101	Cross-Site Scripting (XSS) Attempt: SS Attack Detected via libinjection	Detects an SS attack via libinjection.
941110	Cross-Site Scripting (XSS) Attempt: XSS Filters - Category 1	Detects script tag-based XSS vectors, for example, <script> alert(1)</script>.

Rule ID/Key	Name	Description
941120	Cross-Site Scripting (XSS) Attempt: XSS Filters - Category 2	Detects XSS vectors making use of event handlers like onerror, onload etc., for example, <body onload="alert(1)">.
941130	Cross-Site Scripting (XSS) Attempt: XSS Filters - Category 3	Detects XSS vectors making use of attribute vectors.
941140	Cross-Site Scripting (XSS) Attempt: XSS Filters - Category 4	Detects XSS vectors making use of javascript URI and tags, for example, <p style="background:url(javascript:alert(1))">.
941150	Cross-Site Scripting (XSS) Attempt: XSS Filters - Category 5	Detects HTML attributes - src, style, and href.
941160	Cross-Site Scripting (XSS) Attempt: NoScript XSS Filters	Detects NoScript InjectionChecker: HTML Injection.
941170	Cross-Site Scripting (XSS) Attempt: NoScript XSS Filters	Detects NoScript InjectionChecker: Attributes injection.
941180	Cross-Site Scripting (XSS) Attempt: Blacklist Keywords from Node-Validator	Detects Blacklist Keywords from Node-Validator.
941190	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.

Rule ID/Key	Name	Description
941200	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.
941210	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.
941220	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.
941230	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.
941240	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.
941250	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.
941260	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.
941270	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.

Rule ID/Key	Name	Description
941280	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.
941300	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.
941310	Cross-Site Scripting (XSS) Attempt: US-ASCII encoding bypass listed on XSS filter evasion	Cross-Site Scripting (XSS) Attempt: US-ASCII encoding bypass listed on XSS filter evasion
941320	Cross-Site Scripting (XSS) Attempt: HTML Tag Handler	Cross-Site Scripting (XSS) Attempt: HTML Tag Handler
941330	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.
941340	Cross-Site Scripting (XSS) Attempt: XSS Filters from Internet Explorer	Detects XSS Filters from IE.
941350	Cross-Site Scripting (XSS) Attempt: UTF-7 encoding XSS filter evasion for IE	Cross-Site Scripting (XSS) Attempt: UTF-7 encoding XSS filter evasion for IE.
950002	Common System Command Access Attempt	Detects access attempts to common system commands, such as map, telnet, ftp, rcms, cmd.

Rule ID/Key	Name	Description
950005	Common System Files Access Attempt	Detects access attempts to common system files, such as access, passwd, groupm global.asa, httpd.conf, boot.ini, /etc.
950006	Injection for Common System Commands	Detects injections for common system commands such as telnet, map, blocalgroup, ftp, rcmd, echo, cmd, chmod, passwd, mail.
950007	Blind SQL Injection	Detects common blind SQL injection attacks.
950009	Session Fixation	Detects Session Fixation, an attack technique that forces a user's session ID to an explicit value. Depending on the functionality of the target website, several techniques can be utilized to "fix" the session ID value. These techniques range from Cross-site Scripting exploits to peppering the website with previously made HTTP requests. After a user's session ID has been fixed, the attacker will wait for that user to log in. Once the user does so, the attacker uses the predefined session ID value to assume the same online identity.
950010	LDAP Injection	Detects common LDAP data constructions injections.
950011	SSI Injection	Detects common Server-Side-Include format data injections.

Rule ID/Key	Name	Description
950012	HTTP Request Smuggling	Detects specially crafted requests that under certain circumstances could be seen by the attacked entities as two different sets of requests. This allows certain requests to be smuggled through to a second entity without the first one realizing it.
950018	UPDF XSS Injection	Detects submitted links that contains the # fragment in a query_string.
950019	Email Injection	Detects mail command injections targeting mail servers and webmail applications that construct IMAP/SMTP statements from user-supplied input that is not properly sanitized.
950103	Path/Directory Traversal	Detects path traversal attempts, also known as directory traversal or "../" attacks.
950107	URL Encodings Validation	Detects URL encoding inconsistencies, encoding abuse, and invalid formatting.
950116	Unicode Encoding/Decoding Validation	blocks full-width Unicode encoding as decoding evasions could be possible.
950117	URL Contains an IP Address	Detects a common RFI attack, when a URL contains an IP address.
950118	PHP Include() Function	Detects a common RFI php include() function attacks.
950119	Data Ends with Question Mark (s) (?)	Detects a common RFI attack, when data ends with question mark(s) (?).

Rule ID/Key	Name	Description
950120	Host Doesn't Match Localhost	Detects a common RFI attack, when host doesn't match localhost.
950801	UTF Encoding Validation	Detects UTF encoding inconsistencies and invalid formatting.
950907	OS Command Injection	Detects OS command injection in an application to elevate privileges, execute arbitrary commands, compromise the underlying operating system and install malicious toolkits such as those to participate in botnet attacks.
950910	HTTP Response Splitting	Detects Carriage Return + Linefeed characters in the response header that could cause attacked entities to interpret it as two separate responses instead of one.
958000	Addimport XSS Attack	Detects usage of addimport in request, cookies, or arguments.
958001	document Cookie XSS Attack	Detects usage of document.cookie in request, cookies, or arguments.
958002	execscript XSS Attack	Detects usage of execscript in request, cookies, or arguments.
958003	fromcharcode XSS Attack	Detects usage of fromcharcode in request, cookies, or arguments.
958004	innerhtml XSS Attack	Detects usage of innerhtml in request, cookies, or arguments.

Rule ID/Key	Name	Description
958005	cdata XSS Attack	Detects usage of cdata in request, cookies, or arguments.
958006	body background XSS Attack	Detects usage of <body background in request, cookies, or arguments.
958007	onload XSS Attack	Detects usage of onload in request, cookies, or arguments.
958008	input type image XSS Attack	Detects usage of <input type image in request, cookies, or arguments.
958009	import XSS Attack	Detects usage of import in request, cookies, or arguments.
958010	activexobject XSS Attack	Detects usage of activexobject in request, cookies, or arguments.
958011	background-image: XSS Attack	Detects usage of background-image: in request, cookies, or arguments.
958012	copyparentfolder XSS Attack	Detects usage of copyparentfolder in request, cookies, or arguments.
958013	createtextrange XSS Attack	Detects usage of createtextrange in request, cookies, or arguments.
958016	getparentfolder XSS Attack	Detects usage of getparentfolder in request, cookies, or arguments.
958017	getspecialfolder XSS Attack	Detects usage of getspecialfolder in request, cookies, or arguments.

Rule ID/Key	Name	Description
958018	href javascript: XSS Attack	Detects usage of href javascript: in request, cookies, or arguments.
958019	href schell XSS Attack	Detects usage of href schell in request, cookies, or arguments.
958020	href vbscript: XSS Attack	Detects usage of href vbscript: in request, cookies, or arguments.
958022	livescript: XSS Attack	Detects usage of livescript: in request, cookies, or arguments.
958023	lowsrc javascript: XSS Attack	Detects usage of lowsrc javascript: in request, cookies, or arguments.
958024	lowsrc shell XSS Attack	Detects usage of lowsrc shell in request, cookies, or arguments.
958025	lowsrc vbscript XSS Attack	Detects usage of lowsrc vbscript in request, cookies, or arguments.
958026	mocha: XSS Attack	Detects usage of mocha: in request, cookies, or arguments.
958027	onabort XSS Attack	Detects usage of onabort in request, cookies, or arguments.
958028	settimeout XSS Attack	Detects usage of settimeout in request, cookies, or arguments.
958030	src http: XSS Attack	Detects usage of src http: in request, cookies, or arguments.

Rule ID/Key	Name	Description
958031	javascript: XSS Attack	Detects usage of javascript: in request, cookies, or arguments.
958032	src and shell XSS Attack	Detects usage of src and shell in request, cookies, or arguments.
958033	vbscript: XSS Attack	Detects usage of vbscript: in request, cookies, or arguments.
958034	style bexpression XSS Attack	Detects usage of style bexpression in request, cookies, or arguments.
958036	type application x-javascript XSS Attack	Detects usage of type application x-javascript in request, cookies, or arguments.
958037	type application x-vbscript XSS Attack	Detects usage of type application x-vbscript in request, cookies, or arguments.
958038	type text ecmascript XSS Attack	Detects usage of type text ecmascript in request, cookies, or arguments.
958039	type text javascript XSS Attack	Detects usage of type text javascript in request, cookies, or arguments.
958040	type text jscript XSS Attack	Detects usage of type text jscript in request, cookies, or arguments.
958041	type text vbscript XSS Attack	Detects usage of type text vbscript in request, cookies, or arguments.
958045	url javascript: XSS Attack	Detects usage of url javascript: in request, cookies, or arguments.

Rule ID/Key	Name	Description
958046	url shell XSS Attack	Detects usage of <url shell in request, cookies, or arguments.
958047	url vbscript: XSS Attack	Detects usage of url vbscript: in request, cookies, or arguments.
958049	?meta XSS Attack	Detects usage of ?meta in request, cookies, or arguments.
958051	?script XSS Attack	Detects usage of < ?script in request, cookies, or arguments.
958052	alert XSS Attack	Detects usage of alert in request, cookies, or arguments.
958054	lowsrc and http: XSS Attack	Detects usage of lowsrc and http: in request, cookies, or arguments.
958056	iframe src XSS Attack	Detects usage of iframe src in request, cookies, or arguments.
958057	?iframe XSS Attack	Detects usage of ?iframe in request, cookies, or arguments.
958059	asfunction: XSS Attack	Detects usage of asfunction: in request, cookies, or arguments.
958291	Range Header Validation	Detects range header inconsistencies and invalid formatting.
958295	Connection Header Validation	Detects connection header inconsistencies and invalid formatting.

Rule ID/Key	Name	Description
958404	onerror XSS Attack	Detects usage of onerror in request, cookies, or arguments.
958405	onblur XSS Attack	Detects usage of onblur in request, cookies, or arguments.
958406	onchange XSS Attack	Detects usage of onchange in request, cookies, or arguments.
958407	onclick XSS Attack	Detects usage of onclick in request, cookies, or arguments.
958408	ondragdrop XSS Attack	Detects usage of ondragdrop in request, cookies, or arguments.
958409	onfocus XSS Attack	Detects usage of onfocus in request, cookies, or arguments.
958410	onkeydown XSS Attack	Detects usage of onkeydown in request, cookies, or arguments.
958411	onkeypress XSS Attack	Detects usage of onkeypress in request, cookies, or arguments.
958412	onkeyup XSS Attack	Detects usage of onkeyup in request, cookies, or arguments.
958413	onload XSS Attack	Detects usage of onload in request, cookies, or arguments.
958414	onmousedown XSS Attack	Detects usage of onmousedown in request, cookies, or arguments.

Rule ID/Key	Name	Description
958415	onmousemove XSS Attack	Detects usage of onmousemove in request, cookies, or arguments.
958416	bonmouseout XSS Attack	Detects usage of bonmouseout in request, cookies, or arguments.
958417	bonmouseover XSS Attack	Detects usage of bonmouseover in request, cookies, or arguments.
958418	onmouseup XSS Attack	Detects usage of onmouseup in request, cookies, or arguments.
958419	onmove XSS Attack	Detects usage of onmove in request, cookies, or arguments.
958420	onresize XSS Attack	Detects usage of onresize in request, cookies, or arguments.
958421	onselect XSS Attack	Detects usage of onselect in request, cookies, or arguments.
958422	onsubmit XSS Attack	Detects usage of onsubmit in request, cookies, or arguments.
958423	onunload XSS Attack	Detects usage of onunload in request, cookies, or arguments.
959151	php Code Injection	Detects a common injections attack, when request contain any php code e.g. "<\?>".
960000	File Name Validation	Detects multipart/form-data file name evasion attempts.

Rule ID/Key	Name	Description
960007	Missing Host Header	Detects missing request host header.
960009	Missing User-Agent Header	Detects missing request user-agent header.
960011	GET/HEAD Requests Validation	Detects if GET/HEAD requests contain request body since it is not a common practice.
960012	Content-Length Header Validation	Detects if content-length header is provided with every POST request.
960013	Require Content-Length to be provided with every HTTP/1.1 POST request that has no Transfer-Encoding header	Detects HTTP/1.1 requests that do not comply with HTTP 1.1 spec by having no content-length header when transfer-encoding is also absent.
960014	URI Validation	Ensures that URI and canonical server name are matching.
960015	Missing Accept Header	Detects missing request accept header.
960016	Content-Length Header Validation	Detects if content-length HTTP header is not numeric.
960017	Host Header Is IP Address	Detects if host header is a numeric IP address as it could be indicative of automated client access.
960020	Pragma Header Validation	Ensures that pragma, cache-control headers and HTTP protocol version supplied by the client are matching.
960022	Expect Header Validation	Ensures that expect header and HTTP protocol version supplied by the client are matching.

Rule ID/Key	Name	Description
960024	Repetitive Non-Word Chars	Attempts to identify when 4 or more non-word characters are repeated in sequence.
960208	Values Limits	Detects HTTP requests with value length exceeding the configurable "Max length of argument" parameter.
960209	Arguments Limits	Detects HTTP requests with argument name length exceeding the 100 symbols.
960335	Number of Arguments Limits	Detects HTTP requests with number of arguments exceeding the configurable "Max amount of arguments" value.
960341	Total Arguments Limits	Detects HTTP requests with total length of all arguments exceeding the configurable "Max total argument length" parameter.
960901	Character Set Validation	Ensures that only a specific character set(s) is used.
960902	Content-Encoding Header Validation	Ensures that identity is not specified in content-encoding header.
960904	Missing Content-Type Header	Detects missing content-type header or if combination of content-length and content-type headers is invalid.

Rule ID/Key	Name	Description
960911	Request Line Format Validation Against the HTTP RFC	Uses rule negation against the regex for positive security. The regex specifies the proper construction of URI request lines such as: "http:" "//" host [":" port] [abs_path ["?" query]]. It also outlines proper construction for CONNECT, OPTIONS, and GET requests.
960912	Malformed request bodies	Checks for request body parsing errors.
960914	Strict Multipart Parsing Checks	Uses strict checks for what is accepted in the multipart/form-data request body. If the rule proves to be too strict for your environment consider changing it to Off.
960915	Multipart Unmatched Boundary Check	Checks for signs of evasions during file upload requests.
970901	5XX Status Code Information Leakage	Detects if an application generates 500-level status code. For example, 500 Internal Server Error, 501 Not Implemented...505 HTTP Version Not Supported.
973300	Common Direct HTML Injection	Detects tags that are the most common direct HTML injection points.
973306	Embedded JavaScript in Style Attribute	Detects embedded JavaScript in style attribute.
973307	Embedded Scripts Within JavaScript Fragments	Detects common JavaScript fragments like fromcharcode, alert, eval that can be used for attacks.

Rule ID/Key	Name	Description
973309	CSS Fragments Attacks	Detects common CSS fragments attacks like or <img style="x:expression (document.write(1))">.
973310	Embedded Scripts Within Alert Fragments	Detects attacks like alert('xss'), alert("xss"), alert(/xss/).
973311	String.fromCharCode (88,83,83) attacks	Detects String.fromCharCode(88,83,83) attacks.
973312	'';!--"<XSS>=&{()} Attacks	Detects '';!--"<XSS>=&{()} attacks.
973313	&{alert('xss')} Attacks	Detects &{alert('xss')} attacks.
973314	Doctype Entity Inject	Detects Doctype Entity inject attacks.
973331	Internet Explorer XSS Filters	Detects common IE XSS attacks.
973336	Embedding Scripts Within Scripts	Detects script tag-based XSS vectors. For example, <script> alert(1)</script>.
973337	Embedded Scripts Within Event Handlers	Detects event handler based XSS vectors. For example, <body onload="alert(1)">.
973338	Embedded Scripts Within URI Schemes	Detects "data", "javascript", "src" or other URI schemes/attributes based XSS vectors. For example, <p style="background:url (javascript:alert(1))">.

Rule ID/Key	Name	Description
981136	Generic XSS Attacks	Detects common XSS attacks embedded within non-script elements. For example, jscript onsubmit copyparentfolder document javascript meta onchange onmove onkeydown onkeyup activexobject onerror onmouseup ecmascript bexpression onmouseover vbscript.
981172	SQL Character Anomaly Scoring	Attempts to gauge when there is an excessive use of meta-characters within a single parameter payload.
981227	Request URI Validation	Detects invalid URI in request.
981242	–°lassic SQL Injection Probings	Detects classic SQL injection probings.
981244	SQL Authentication Bypass Attempts	Detects basic SQL authentication bypass attempts.
981245	SQL Authentication Bypass Attempts	Detects basic SQL authentication bypass attempts.
981246	SQL Authentication Bypass Attempts	Detects basic SQL authentication bypass attempts.
981272	SQL Injection Using sleep() or benchmark()	Detects blind SQL injection tests using sleep() or benchmark() functions.
981300	SQL Keyword Anomaly Scoring	Detects common SQL keywords anomalies.

Rule ID/Key	Name	Description
981318	String Termination/Statement Ending	Identifies common initial SQLi probing requests where attackers insert/append quote characters to the existing normal payload to see how the app/db responds.
1000000	Shellshock Exploit Attempt	Detects the ability to unintentionally execute commands in Bash (CVE-2014-6271).
2017100	Apache Struts 2 Multipart Parser CVE-2017-5638 Remote Code Execution Vulnerability Prevention	Detects Apache Jakarta CVE-2017-5638 Remote Code Execution Vulnerability Payload.
2018100	CVE-2018-6389 WordPress Parameter Resource Consumption Remote DoS	Detects WordPress parameter resource consumption remote DoS on jquery-ui-core .
2100019	/_layouts/scriptresx.ashx sections Parameter XSS	Detects Microsoft SharePoint /_ layouts/scriptresx.ashx sections parameter XSS attacks.
2100023	/owssrv.dll List Parameter XSS	Detects Microsoft SharePoint /owssrv.dll List Parameter XSS attacks.
2100026	_ layouts/Chart/WebUI/WizardList.aspx skey Parameter XSS	Detects Microsoft SharePoint _ layouts/Chart/WebUI/WizardList.aspx skey Parameter XSS attacks.
2100027	_layouts/themeweb.aspx XSS	Detects Microsoft SharePoint _ layouts/themeweb.aspx ctl00$PlaceHolderMain$ctl82 $customizeThemeSection$accent6 Parameter XSS attacks.

Rule ID/Key	Name	Description
2100028	_layouts/inplview.aspx ListViewPageUrl Parameter XSS	Detects Microsoft SharePoint _ layouts/inplview.aspx ListViewPageUrl Parameter XSS attacks.
2100032	owssrv.dll View Parameter XSS	Detects Microsoft SharePoint owssrv.dll View Parameter XSS attacks.
2100033	NewForm.aspx TextField_ spSave Parameter XSS	Detects Microsoft SharePoint NewForm.aspx TextField_spSave Parameter XSS attacks.
2100034	/Lists/Calendar/calendar.aspx CalendarDate Parameter XSS	Detects Microsoft SharePoint /Lists/Calendar/calendar.aspx CalendarDate Parameter XSS attacks.
2100035	_layouts/Picker.aspx XSS	Detects Microsoft SharePoint _ layouts/Picker.aspx ctl00$PlaceHolderDialogBodySection$ctl04$hiddenSpanData Parameter XSS attacks.
2100048	_layouts/help.aspx cid0 Parameter XSS	Detects Microsoft SharePoint _layouts/help.aspx cid0 Parameter XSS attacks.
2100062	_layouts/ScriptResx.ashx name Parameter LFI	Detects Microsoft SharePoint _ layouts/ScriptResx.ashx name Parameter LFI attacks.
2100063	_ layouts/OSSSearchResults.aspx k Parameter XSS	Detects Microsoft SharePoint _ layouts/OSSSearchResults.aspx k Parameter XSS attacks.

Rule ID/Key	Name	Description
2100069	wiki pages multiple Parameter XSS	Detects Microsoft SharePoint wiki pages multiple Parameter XSS (CVE-2013-3180) attacks.
2100070	/Lists/Links/AllItems.aspx XSS	Detects Microsoft SharePoint /Lists/Links/AllItems.aspx ctl00mg_2085a732_4692_4d3e_99d2_4d90ea5108d2$ctl00$ctl05$ctl00$ctl00$ctl00$ctl04$ctl00$ctl00$UrlFieldUrl Parameter XSS attacks.
2100082	Drupal - pre-auth SQL Injection Vulnerability	Detects Drupal pre-auth SQL injection vulnerability. A malicious user can inject arbitrary SQL queries and thereby control the complete Drupal site. This leads to a code execution as well. Drupal 7.32 fixed this bug.
2100083	Gerber WebPDM XSS Vulnerability	Detects cross-site scripting vulnerability in Gerber WebPDM Product Data Management System.
2100084	Gerber WebPDM SQL Injection Vulnerability	Detects SQL Injection Vulnerability in Gerber WebPDM Product Data Management System.
2100085	High X-SharePointHealthScore	Detects Microsoft SharePoint High X-SharePointHealthScore - potential DoS attack/availability risk.
2100086	Response Header Found	Detects Microsoft SharePoint SharePointError Response Header Found.
2100087	x-virus-infected Response Header Found	Detects x-virus-infected Response Header Found.

Rule ID/Key	Name	Description
2100088	Rights Management (IRM) Error Response Header Found	Detects Microsoft SharePoint Information Rights Management (IRM) Error Response Header Found.
2100089	/_ layouts/mobile/editform.aspx XSS	Detects Microsoft SharePoint /_ layouts/mobile/editform.aspx XSS attacks.
2200924	IRC Botnet Attacks	Detects common IRC Botnet attack commands.
2200925	Detects HOIC DoS Tool Requests	Detects HOIC DoS tool requests.
2250117	Common RFI Attacks	Detects common types of Remote File Inclusion (RFI) attacks.
2250120	Local File Inclusion Attacks	Detects common local file inclusion attacks like my $dir = "../../../../../../../../../../../../"; or "http://".$site.$bug.$dir."/proc/self/environ%0000";.
2250121	Local File Inclusion ENV Attack in User-Agent	Detects Local File Inclusion ENV Attack in User-Agent
2250122	PHP Injection Attack	Detects common php injection attacks like "send-contactus=1&author_name=[php]eval (base64_decode ('".$code."'))%3Bdie%28%29%3B%5B%2Fphp%5D"

Rule ID/Key	Name	Description
2250123	XML-RPC PHP Injection Attack	Detects common XML-RPC PHP Injections like $exploit .= "echo'j13mb0t';".$code."echo'j13mb0t';exit;/* </name> </value></param></params></methodCall>";
2250125	osCommerce File Upload	Detects osCommerce file upload attacks like "http://".$site."admin/file_ manager.php/login.php";.
2250126	Oscommerce File Disclosure and Admin ByPass	Detects Oscommerce File Disclosure and Admin ByPass.
2250127	e107 Plugin my_gallery Exploit	Detects e107 Plugin my_gallery Exploit "http://".$site."e107_plugins/my_ gallery/image.php?file=../../e107_config.php".
2250128	Opencart Remote File Upload Vulnerability	Detects Opencart remote file upload vulnerability.
2250129	Zen Cart Local File Disclosure Vulnerability	Detects Zen Cart local file disclosure vulnerability.
20182056	CVE-2003-1567 CVE-2004-2320 CVE-2010-0360 TRACE & CONNECT Attempts	Detects TRACE method attempts.
20182137 5	CVE-2012-0209, Remote Execution Backdoor Attempt Against Horde	Detects remote execution backdoor attempt against Horde.

Rule ID/Key	Name	Description
201821438	CVE-2012-1723, CVE-2012-1889, CVE-2012-4681, Blackhole Exploit Kit JavaScript Carat String Splitting with Hostile Applet	Detects Blackhole exploit kit JavaScript carat string splitting with hostile applet.
201822063	CVE-2012-1823, CVE-2012-2311, CVE-2012-2335, CVE-2012-2336, PHP-CGI Remote File Include Attempt	Detects PHP-CGI remote file include attempts.
201826834	CVE-2012-4681, CVE-2012-5076, CVE-2013-2423, Sweet Orange Exploit Kit Landing Page in.php base64 uri	Detects Sweet Orange exploit kit landing page in.php base64 uri attacks.
201826947	CVE-2013-2423, DotkaChef/Rmayana/DotCache Exploit Kit Inbound Java Exploit Download	Detects DotkaChef/Rmayana/DotCache exploit kit inbound java exploit download attacks.
201826948	CVE-2013-1493, DotkaChef/Rmayana/DotCache Exploit Kit Inbound Java Exploit Download	Detects DotkaChef/Rmayana/DotCache exploit kit inbound java exploit download attacks.
201827040	CVE-2013-0422, CVE-2013-2423, Styx Exploit Kit Plugin Detection Connection Jorg	Detects Styx exploit kit plugin detection connection jorg attacks.

Rule ID/Key	Name	Description
201841409	CVE-2017-3823, CVE-2017-6753, Cisco WebEx Explicit Use of Web Plugin	Detects Cisco WebEx explicit use of web plug-in.
201843811	CVE-2017-9812, Kaspersky Linux File Server WMC Directory Traversal Attempt	Detects Kaspersky Linux file server WMC directory traversal attempts.

Access Control

As a WAF administrator you can define explicit actions for requests that meet various conditions. Conditions use various operations and regular expressions. A rule action can be set to log and allow, detect, or block requests.

The available conditions are shown in the following table:

Criteria Type	Criteria
URL	Users shall be able define to one or more criteria based on: • URL is • URL is not • URL starts with • URL ends with • URL contains • URL regex The URL regex matching uses Perl-compatible regular expressions.
IP Address	Users shall be able define to one or more criteria based on: • Client IP Address is • Client IP Address is not These values can be a valid IPv4 address, subset, or CIDR notation for a range. IPv6 is not yet supported.
Geo/Country	Users shall be able define to one or more criteria based on: • Country is • Country is not For the API, use a 2-letter country code.

Criteria Type	Criteria
UserAgent	User Agent is a value that identifies the browser client. • User Agent is • User Agent is not
HTTP Header	HTTP Request headers can be evaluated as criteria: • HTTP Header contains The HTTP Header contains value should be entered with colon-delimited <name>:<value> .

You can use the IP Whitelist tab to manage whitelists containing trusted IP addresses that bypass all rules and challenges.

Using the Console

Note

The WAF uses a first-match algorithm so that once an Access Rule criteria matches, it will stop evaluating future rules. The order of rules matters. Use the API to reorder rules.

To add an access rule

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to view IP Address Whitelists for. The WAF Policy overview appears.

3. Click **Access Control**.
4. Select the **Access Rules** tab.
5. Click **Add Access Rule**.
6. In the Add Access Rule dialog box, enter the following:
    - **Name:** A unique name for the access rule. Avoid entering confidential information.
    - **Rule Condition:** Select the condition that must be met before the rule is matched and specify the details of the condition. Additional conditions can be added in this section.
    - **Rule Action:** Determines the response to a request when the rule is matched. Select one of the following options:
        - **Log and Allow**: A log will be created for all matched requests and no further action will be taken.
        - **Detect Only**: A detection alert will be created for all matched requests and no further action will be taken.
        - **Block:** All matched requests will be blocked and a browser page for the selected response code will be returned.
            - **Block Action**: Select the action that will be taken when a matching request is blocked.
            - **Block Response Code:** Select a response code that will be returned when the request has been blocked. The response code provides information indicating why the request was blocked. The default response code is 403 "Forbidden".
7. Click **Add Access Rule**. The access rule is added to the access rule list.

To edit an access rule

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge**

Services and click **WAF Policies**.

2. Click the name of the WAF Policy you want to view access rules for. The WAF Policy overview appears.
3. Click **Access Control**.
4. Select the **Access Rules** tab.
5. Select the check box for the access rule you want to update and then select **Edit** from the **Actions** drop-down menu.
6. In the Edit Access Rule dialog box, make the necessary updates and then click **Save**.

To delete an access rule

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to view access rules for. The WAF Policy overview appears.
3. Click **Access Control**.
4. Select the **Access Rules** tab.
5. Select the check box for the access rule you want to delete and then select **Delete** from the **Actions** drop-down menu.

To add an IP address whitelist

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to view IP Address Whitelists for. The WAF Policy overview appears.
3. Click **Access Control**.
4. Select the **IP Whitelist** tab.

5. Click **Add IP Address Whitelist**.
6. In the Add IP Address Whitelist dialog box, enter the following:
   - **Whitelist Name:** A name for the IP addresses used in the list.
   - **IP Addresses:** Select an IP address or enter an IP address and select it to add it. This field supports CIDR notation.
7. Click **Add IP Address Whitelist**.

   The IP Address Whitelist is added to the list of changes to be published.

To edit an IP Address Whitelist

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to view IP Address Whitelists for. The WAF Policy overview appears.
3. Click **Access Control**.
4. Select the **IP Whitelist** tab.
5. Select the check box for the IP Address Whitelist name you want to edit.
6. Click **Edit**.
7. In the Edit IP Address Whitelist dialog box, make the needed changes.
8. Click **Save**.

   The IP Address Whitelist change is added to the list of changes to be published.

To delete an IP Address Whitelist

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to view alerts for. The WAF Policy overview appears.

3. Click **Access Control**.
4. Select the **IP Whitelist** tab.
5. Select the check box for the IP Address Whitelist name you want to delete.
6. Click **Delete**.

   The deleted IP Address Whitelist is added to the list of changes to be published.

To publish changes

Updates to your WAF policy appear in the list to be published in Unpublished Changes. Pending changes do not persist across browser sessions. Once you publish changes, it cannot be edited until changes propagate to the edge nodes.

1. Under WAF Policy, click **Unpublished Changes**.
2. In the Unpublished Changes list, click the drop-down arrow beside an unpublished change to review the change.
3. Click **Publish All**.
4. In the Publish Changes dialog box, click **Publish All**.

To discard changes

Updates to your WAF policy appear in the list to be published in Unpublished Changes.

1. Under WAF Policy, click **Unpublished Changes**.
2. In the Unpublished Changes list, click the drop-down arrow beside an unpublished change to review the change.
3. Select the check box for the change you want to discard.
4. Click **Discard**.
5. In the Discard Change dialog box, click **Discard**.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations to get an array of all access rules in the policy:

- UpdateAccessRules
- ListAccessRules
- UpdateWhitelists
- ListWhitelists

To create an access rule:

```
PUT /waasPolicies/{waasPolicyId}/wafConfig/accessRules
```

```
[
   {
   "name": "DetectRequestsToHealthCheck",
   "criteria": [
      {
      "condition": "URL_IS",
      "value": "/health/check"
      }
               ],
   "action": "DETECT",
      }
]
```

Threat Intelligence

WAF has several sources of known IP address threats that are updated daily. The IP address threats are displayed in the following table:

Source	Description
ABUSE|ch	Blacklist of "bad" SSL certificates identified by abuse.ch to be associated with malware or botnet activities.
Bambenek Consulting	Active and non-sinkholed Command & Control (C&C) IP addresses.
BlockList.de	Includes IP addresses for hosting phishing sites and other kinds of fraud activities such as ad-click or gaming fraud.
BruteForceBlocker Project	Feed of known IP addresses from blocked SSH brute force attacks.
Proofpoint ET Labs	IP addresses involved in suspicious and malicious activity.
Feodo IP Blocklist	IP addresses used as C&C communication channel by the Feodo Trojan.
Palevo	IP addresses which are being used as botnet C&C for the Palevo crimeware.
Webroot BotNets	Botnet C&C channels and infected zombie machine controlled by Bot master.
Webroot Denial of Service	Includes DOS, DDOS, anomalous sync flood, and anomalous traffic detection.
Webroot Mobile Threats	IP addresses of malicious and unwanted mobile applications. This category leverages data from the Webroot mobile threat research tea.
Webroot Phishing	IP addresses hosting phishing sites and other kinds of illicit activities such as ad-click or gaming fraud.
Webroot Proxy	IP addresses providing proxy and def services.

Source	Description
Webroot Reputation	IP addresses currently known to be infected with malware. This category also includes IP addresses with an average low Webroot Reputation Index score.
Webroot Scanners	Includes all reconnaissance such as probes, host scan, domain scan and password brute force attacks.
Webroot Spam Sources	Includes tunneling spam messages through proxy, anomalous SMTP activities, and forum spam activities.
Webroot Tor Proxy	Includes IP addresses acting as exit nodes for the Tor Network. Exit nodes are the last point along the proxy chain and make a direct connection to the originator's intended destination.
Webroot Web Attacks	Includes known IP addresses involved in cross site scripting, iFrame injection, SQL injection, cross domain injection, or domain password brute force attacks.
Webroot Windows Exploits	Includes active IP addresses offering or distributing malware, shell code, rootkits, worms or viruses.
ZueS	IP blocklist including known C&C servers/hosts.

Using the CLI

You can use the CLI to enable threat intelligence sources to block.

Open a command prompt and run the following command to list the keys for all of the threat intelligence:

```
oci waas threat-feed list --waas-policy-id <policy_ocid>
```

Then parse the keys to block and add them to the JSON:

```
oci waas threat-feed update --threat-feeds '[{"key":"<key_id>","action":"BLOCK"}]' --waas-policy-id
<policy_ocid>
```

For example:

```
oci waas threat-feed update --threat-feeds '[{"key":"0998d237-bce8-4612-82c8-
a1ca126c0492","action":"BLOCK"}]' --waas-policy-id
ocid1.waaspolicy.oc1..aaaaaaaapfa5zrwnns75kru7mrlzkkmcdevp7w55ld3phjxtgl4s2phuepjq
```

Using the API

Enabling Threat Intelligence can only be performed by using the API at this time.

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

To return a set of keys for the threat intelligence:

- ListThreatFeeds

Note

Do not use the keys in the example below, as keys are unique across each policy.

```
{
        "8d3f7f1b-673f-4e3a-ba49-08226f385df3": "OFF",
        "0ff7b308-6afe-4b83-91e0-e3ca04afed6e": "OFF",
        "ea5d7c67-1326-43c9-ac31-1df034b9c063": "OFF",

{"action":"DETECT","key":"65cf274d-991b-41f8-adda-6fe60ba2704f"}
]
```

  This will return a 202 Accepted HTTP status, which means the policy will enter an UPDATING state until changes are provisioned to the edge nodes.

Settings

To use SSL with your WAF policy, you must add a certificate bundle. The certificate bundle you upload includes the public certificate and the corresponding private key. Self-signed

certificates can be used for the internal communication within Oracle Cloud Infrastructure.

Working with SSL Certificates

Oracle Cloud Infrastructure accepts third-party and self-signed certificates in PEM format only. The following is an example PEM encoded certificate:

```
-----BEGIN CERTIFICATE-----
<Base64_encoded_certificate>
-----END CERTIFICATE-----
```

Obtaining Third-Party SSL Certificates

You can purchase an SSL certificate from a trusted Certificate Authority such as Symantec, Thawte, RapidSSL, or GeoTrust. The certificate issuer will provide an SSL certificate that includes a certificate, intermediate certificate, and private key. Use this information, including the intermediate certificate, when adding an SSL certificate to Oracle Cloud Infrastructure.

Converting to PEM format

If you receive your certificates and keys in formats other than PEM, you must convert them before you can upload them to the system. You can use OpenSSL to convert certificates and keys to PEM format.

Uploading Certificate Chains

If you have multiple certificates that form a single certification chain, you must include all relevant certificates in one file before you upload them to the system. The following example of a certificate chain file includes four certificates:

```
-----BEGIN CERTIFICATE-----
<Base64_encoded_certificate>
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
<Base64_encoded_certificate>
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
<Base64_encoded_certificate>
-----END CERTIFICATE-----
```

```
-----BEGIN CERTIFICATE-----
<Base64_encoded_certificate>
-----END CERTIFICATE-----
```

SUBMITTING PRIVATE KEYS

If your private key submission returns an error, the most common reasons are your private key is malformed or the system does not recognize the encryption method used for your key.

PRIVATE KEY CONSISTENCY

If you receive an error related to the private key, you can use OpenSSL to check its consistency:

```
openssl rsa -check -in <private_key>.pem
```

This command verifies that the key is intact, the passphrase is correct, and the file contains a valid RSA private key.

DECRYPTING A PRIVATE KEY

If the system does not recognize the encryption technology used for your private key, decrypt the key. Upload the unencrypted version of the key with your certificate bundle. You can use OpenSSL to decrypt a private key:

```
openssl rsa -in <private_key>.pem -out <decrypted_private_key>.pem
```

Using the Console

TO EDIT WAF SETTINGS

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to view settings for. The WAF Policy overview appears.
3. Click **Settings**.
4. Click **Edit**.

5. In the **Edit Settings** dialog box, enter the following:
    - **WAF Origin:** Select the name and IP address of the origin.
    - **Enable HTTPS Support:** When enabled, all communications between the browser and web app are encrypted. Enter the following information:
        - **SSL Certificate:** Drag and drop, select, or paste a valid SSL certificate in PEM format. You must also include intermediate certificates (the website certificate must be first). The following is an example:

```
-----BEGIN CERTIFICATE-----
<Base64_encoded_certificate>
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
<Intermediate_Base64_encoded_certificate>
-----END CERTIFICATE-----
```

        - **Private Key:** Drag and drop, select, or paste a valid private key in PEM format in this field. The private key cannot be protected by a passphrase. The following is an example:

```
-----BEGIN PRIVATE KEY-----
<Base64_encoded_private_key>
-----END PRIVATE KEY-----
```

        - **Self Signed Certificate:** Enable this field when using a self-signed certificate to show an SSL warning in the browser.
        - **HTTP to HTTPS Redirect:** When enabled, all HTTP traffic is automatically redirected to HTTPS.
6. Click **Save**.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

- CreateCertificate
- GetCertificate

- DeleteCertificate

Logs

Logs displays log activity and the details of each logged event within a specified time frame. Logs enable you to understand what rules and countermeasures are triggered by requests and are used as a basis to move request handling into block mode. Logs can come from Access Control, Protection Rules, or Bot events.

Note

If you have concerns over General Data Protection Regulation (GDPR) requirements, Logs can be disabled for the WAF service. You can use My Oracle Support to file a service request to disable Logs.

Using the Console

To view Logs

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Edge Services** and click **WAF Policies**.
2. Click the name of the WAF Policy you want to view logs for. The WAF Policy overview appears.
3. Click **Logs**. Logs for the WAF policy appear.
4. To help find a log, you can use the following filter options:
    - To view alerting activity data for a specific time range, enter a **Start Date**, **Start Time**, **End Date**, or **End Time**.
    - To view logs for a URL, enter a **Request URL**.
    - To view logs for a client IP address, select an address from the **Client IP Address** drop-down menu.

- To view logs for a country, select a country from the **Country Name** drop-down list.
- To find a type of action, select an **Action** check box.
- To find a log type, select a **Log Type** check box.

5. Click the plus sign next to the Alert Type you want to view.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

- ListWafLogs

CHAPTER 11 Email Delivery

This chapter explains how to send large volume email.

Overview of the Email Delivery Service

Oracle Cloud Infrastructure Email Delivery is an email sending service that provides a fast and reliable managed solution for sending high-volume emails that need to reach your recipients' inbox. Email Delivery provides the tools necessary to send application-generated email for mission-critical communications such as receipts, fraud detection alerts, multi-factor identity verification, and password resets.

Oracle Cloud Infrastructure's Email Deliverability team manages the platform using key deliverability metrics to ensure the best sending reputation possible for your emails.

The following items are provided to you when you send email using the Email Delivery service:

- Unique mailbox provider SMTP configurations on our Mail Transfer Agents (MTA)
- Bounce collection
- User complaint collection
- Email authentication standards
- Deliverability performance

Email Delivery Service Components

Email Delivery uses the components described in this section.

APPROVED SENDERS

An Approved Sender is a resource that equates to the "From" address. An approved sender is associated with a compartment and only exists in the region where the approved sender was configured. If you need to have the same approved sender in another region,

it must be created in the other region. For example, if you create an approved sender in the us-phoenix-1 region, you cannot send email through the us-ashburn-1 region.

SUPPRESSION LIST

The Suppression List is included on your Email Delivery console user interface and from the API. Email Delivery automatically adds email addresses with bounce codes showing permanent failures or user complaints to the suppression list to protect your sender reputation. Email Delivery will not send any messages to these recipients in the future.

Reasons for suppression currently include:

- Complaints
- Hard bounces
- Repetitive soft bounces
- Manual entries
- List-unsubscribe requests

SPF AUTHENTICATION

Sender Policy Framework (SPF) is used by email receivers to detect email spoofing. Using SPF, an email receiver can check if the Internet Protocol (IP) is explicitly authorized to send for that domain.

SPF is implemented by publishing a special TXT record to a domain's DNS records. The TXT record declares which hosts are allowed to send mail on behalf of this domain.

Receiving mail servers check the SPF records of sending domains to verify that the email's source IP address is authorized to send from that domain. Without SPF, a spam or phishing email can be “spoofed” to appear that the email comes from a legitimate domain. Domains that implement SPF are much more likely to block emails attempting to spoof your domain.

For an overview of how SPF works, see Sender Policy Framework. For details on SPF record syntax, see SPF Record Syntax.

Regions and Availability Domains

Email Delivery is available in the us-phoenix-1 and us-ashburn-1 regions. For more information, see Regions and Availability Domains.

The sending application is not required to be located in the region where email is sent. For example, if your sending application is located in a region where Email Delivery is not currently available, you would configure email from one of the regions where it is available. In the Console, change your region to us-phoenix-1 or us-ashburn-1 and create an approved sender. When creating SMTP credentials, any region can be used, as identities are global assets. Configure your application to send email to the region where you created the approved sender (us-phoenix-1 or us-ashburn-1 endpoint) using the SMTP credentials.

When Email Delivery is available in more regions, you can configure Email Delivery in the same region as the sending application to improve performance.

Ways to Access Oracle Cloud Infrastructure

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see SDKs and Other Tools.

To access the Console, you must use a supported browser. You can use the Console link at the top of this page to go to the sign-in page. You are prompted to enter your cloud tenant, your user name, and your password. For general information about using the API, see About the API.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see

Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Email Delivery supports the following authentication types for control plane operations (management endpoint):

- **Instance Authorization:** The IAM service feature that enables instances to be authorized actors (or principals) to perform actions on service resources. Each compute instance has its own identity, and it authenticates using the certificates that are added to it. These certificates are automatically created, assigned to instances and rotated, preventing the need for you to distribute credentials to your hosts and rotate them.
- **Cross-Tenancy:** Cross-tenancy authorization allows customers to share resources between tenancies. To authorize a cross-tenancy request, the request must be endorsed by the requester's tenancy and permitted by the target tenancy.
- **Federated:** Federated authentication enables an administrator to configure a relationship between an identity provider and a service provider. When you federate Oracle Cloud Infrastructure with an identity provider, you manage users and groups in the identity provider. You manage authorization in Oracle Cloud Infrastructure's IAM service. Oracle Cloud Infrastructure tenancies are federated with Oracle Identity Cloud Service by default.

Note

Instance authorization, cross-tenancy, and federated authentication types do not apply to SMTP email sending. An approved sender and SMTP credentials are required and must be associated with the same tenancy for SMTP email sending.

SMTP Authentication and Connection Endpoints

Email Delivery only supports the AUTH PLAIN command when using SMTP authentication. If the sending application is not flexible with the AUTH command, an SMTP proxy/relay can be used. For more information about the AUTH command, see AUTH Command and its Mechanisms.

Use the following regional endpoints for establishing SMTP connections for sending.

- us-phoenix-1: smtp.us-phoenix-1.oraclecloud.com
- us-ashburn-1: smtp.us-ashburn-1.oraclecloud.com

Email Delivery Service Capabilities and Limits

See Service Limits for a list of applicable limits and instructions for requesting a limit increase.

Customers that sign up for a free Oracle Cloud trial are limited to:

- A volume of 200 emails a day.
- Five approved senders.
- Each user is limited to a maximum of two SMTP credentials.
- Sending rates are limited to ten emails per minute.
- Inline attachments.

Enterprise accounts are limited to:

- A volume of 50,000 emails a day.
- 10,000 approved senders.
- Sending rates are limited to 18,000 emails per minute.
- Inline attachments.

Note

The Email Delivery platform supports higher volumes. Limits are set as a safeguard for our customers' reputation. To file a service request to increase the email sending limit, open the navigation menu. Under **Governance and Administration**, go to **Service Limits**. Click **Request a service limit increase**.

Note

Currently, Email Delivery supports messages up to 2 MB, inclusive of message headers, body, and attachments. This is not a limit set per tenant. Larger messages sizes will be available in the future.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

If you're new to policies, see Getting Started with Policies and Common Policies. For more details about policies for Email Delivery, see Details for the Email Service.

Permissions are required for managing and using approved senders and the suppression list. For example:

- To enable all operations on approved senders for a specific user group:

```
Allow group <Your Group Name> to manage approved-senders in tenancy
```

- To enable all operations on suppressions for a specific user group:

```
Allow group <Your Group Name> to manage suppressions in tenancy
```

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Email Delivery supports applying tags to approved senders.

Integration with Oracle Cloud Infrastructure Services

Email Delivery audits the following events:

- Creating a sender (CreateSender)
- Deleting a sender (DeleteSender)
- Retrieving details about a sender (ListSenders)

To view logs for events in the Email Delivery service, your user must be in a group with the ability to view all of the Audit event logs in the tenancy. For more information, see Viewing Audit Log Events.

Getting Started with Email Delivery

The Oracle Cloud Infrastructure enables you to set up the Email Delivery service within the Console.

To begin sending email with Email Delivery, complete the following steps:

1. Generate SMTP credentials for a user.
2. Create an approved sender.

3. Configure SPF.
4. Configure the SMTP connection.

Generate SMTP Credentials for a User

Simple Mail Transfer Protocol (SMTP) credentials are necessary to send email through Email Delivery. Each user is limited to a maximum of two SMTP credentials. If more than two are required, SMTP credentials must be generated on other existing users or more users must be created.

A security best practice is to generate SMTP credentials for a new user instead of your Console user that already has permissions assigned to it. For detailed instructions on creating a user, see Adding Users. The new user must be assigned to a group with permissions to manage `approved-senders` and `suppressions`. For example:

```
Allow group <group name> to use approved-senders in compartment <compartment name>
```

Using the Console

To generate SMTP credentials for a user

1. Open the navigation menu. Under **Governance and Administration**, go to **Identity** and click **Users**. Locate the user in the list that has permissions to manage email, and then click the user's name to view the details.

   Tip

   If your user does not have permissions to view or create users, you can create SMTP credentials under your user. Open the **User** menu () and click **User Settings**.

2. Click **SMTP Credentials**.

3. Click **Generate SMTP Credentials**.
4. Enter a **Description** of the SMTP Credentials in the dialog box.
5. Click **Generate SMTP Credentials**. A user name and password is displayed.
6. Copy the user name and password for your records and click **Close**.

Managing Approved Senders

You must set up an approved sender for all "From:" addresses sending mail via Oracle Cloud Infrastructure or mail will be rejected. An approved sender is associated with a compartment and only exists in the region where the approved sender was configured. That is, if you create an approved sender in the us-phoenix-1 region, you cannot send email through the us-ashburn-1 region.

Approved senders should not be created in the root compartment. If approved senders exist in the root compartment, you are required to create a policy to manage approved senders in the entire tenant. Creating approved senders in a compartment other than the root allows the policy to be specific to that compartment.

Using the Console

To create an approved sender

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Email Delivery** and click **Email Approved Senders**. Ensure that you are in the correct compartment. Your user must be in a group with permissions to manage `approved-senders` in this compartment.
2. Click **Create Approved Sender** within the **Approved Senders** view.
3. Enter the email address you want to list as an approved sender in the **Create Approved Sender** dialog box.

Tags: Optionally, you can apply tags. If you have permissions to create a resource, you also have permissions to apply free-form tags to that resource. To apply a defined tag, you must have permissions to use the tag namespace. For more information about tagging, see Resource Tags. If you are not sure if you should apply tags, skip this option (you can apply tags later) or ask your administrator.

4. Click **Create Approved Sender**. The email address is added to your Approved Senders list.

Tip

Approved senders are unique to tenancies. If an attempt is made to create a duplicate approved sender within a tenancy, the service will return a 409 Conflict error.

To delete an approved sender

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Email Delivery** and click **Email Approved Senders**.
2. Find the approved sender you're interested in, click the Actions icon (three dots), and then click **Delete**.
3. In the confirmation dialog box, click **Confirm**. The email address is removed from the Approved Senders list.

To manage tags for an approved sender

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Email Delivery** and click **Email Approved Senders**.
2. Find the approved sender you're interested in, click the Actions icon (three dots), and then click **View Tags** to view or edit existing tags. Or click **Apply tag(s)** to add new

ones.

For more information, see Resource Tags.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations to manage your approved senders:

- CreateSender
- GetSender
- ListSenders
- DeleteSender

Configure SPF

The Approved Senders section within the Console provides validation of an SPF record for each of your approved senders.

Using the Console

To configure SPF

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Email Delivery** and click **Email Approved Senders**.
2. Select the checkbox for the approved sender you want to view SPF details for and click **View SPF**.

Tip

You can search for an approved sender by using the Search field. Addresses can be sorted alphanumerically or by creation date in ascending or descending order.

3. The Manage SPF dialog box appears indicating whether an SPF record for the approved sender exists.
    - If your domain does not currently have an SPF record, the information necessary to add an SPF record in your DNS setup is displayed. See Managing DNS Service Zones for instructions on adding a zone record in Oracle Cloud Infrastructure. If your DNS setup resides with another provider, please reference their documentation for adding a TXT record to your domain.
        - In your DNS setup, create a TXT record and paste the following information from the dialog box into the record: `v=spf1 include:spf.oracleemaildelivery.com -all`
    - If your domain currently has an SPF record, add the following information to the record to add Oracle Cloud Infrastructure Email Delivery: `include:spf.oracleemaildelivery.com`

Configure SMTP Connection

Set up and test your SMTP connection using an SMTP library or product such as Postfix or SendMail to send email through Oracle Cloud Infrastructure Email Delivery.

To access SMTP sending information to configure the connection in your system, open the navigation menu. Under **Solutions, Platform and Edge**, go to **Email Delivery** and click **Email Configuration**. The following information is displayed:

- **Manage SMTP Credentials:** Access your user credentials. Use the SMTP user credentials (in plain text) when validating your connection.
- **Server Name:** The Email Delivery service hostname.
- **Port:** Email Delivery supports TLS on port 25 or 587.
- **Use Transport Layer Security (TLS):** This field indicates if TLS, the standard means of performing encryption in transit for email, is being used. Customers must encrypt email while it is in transit to the Oracle Cloud Infrastructure Email Delivery service. Encrypted emails are protected from being read during transit.

Important

Java applications (including JavaMail) must be updated to the latest version to ensure the latest protocols, ciphers, and security patches are in compliance with Oracle's supported security policies and ciphers.

SMTP Connection Endpoints

Use the following regional endpoints for establishing SMTP connections for sending.

- PHX: smtp.us-phoenix-1.oraclecloud.com
- IAD: smtp.us-ashburn-1.oraclecloud.com

TLS Requirements

Oracle maintains strict security policies and only accepts email traffic using Transport Layer Security (TLS). Use of TLS 1.2 is mandatory to send email using Oracle Cloud Infrastructure.

The approved TLS 1.2 ciphers are:

- TLS_DHE_RSA_WITH_AES_256_CBC_SHA
- TLS_DHE_RSA_WITH_AES_256_CBC_SHA256
- TLS_DHE_DSS_WITH_AES_256_CBC_SHA256
- TLS_RSA_WITH_AES_256_CBC_SHA
- TLS_RSA_WITH_AES_256_CBC_SHA256
- TLS_DHE_RSA_WITH_AES_128_CBC_SHA
- TLS_DHE_DSS_WITH_AES_128_CBC_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
- TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256
- TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256
- TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256

Managing the Suppression List

Manually add an email address to the suppression list to prevent it from being part of your sending list.

Users are required to have correct permissions to manage the suppression list. Currently, identity policies for suppression must be at the tenant level (not at the compartment level). The following is an example of the permission policy statement.

```
Allow group <group name> to manage suppressions in tenancy
```

Suppressions are stored at the tenancy level. Therefore any request requiring a `compartmentId` must provide the `tenancyId` as the `compartmentId`. For example:

```
Allow group <ordinary users> to inspect approved-senders in tenancy
Allow group <power users> to read approved-senders in tenancy
Allow group <sender admins> to manage approved-senders in tenancy
Allow user <mail user> to use approved-senders in tenancy where target.approved-sender.senderId =
<senderId>

Allow group <ordinary users> to inspect suppressions in tenancy
Allow group <power users> to read suppressions in tenancy
```

```
Allow group <sender admins> to manage suppressions in tenancy
```

Using the Console

To manually add an email address to the suppression list

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Email Delivery** and click **Email Suppression List**.
2. Click **Add Suppression**.
3. In the Add Suppression dialog box, enter the email address.
4. Click **Add**. The email address is added to the Suppression List.

To delete an email address from the suppression list

1. Open the navigation menu. Under **Solutions, Platform and Edge**, go to **Email Delivery** and click **Email Suppression List**.
2. Select the checkbox for the email address you want to delete and then click **Delete**.

Tip

You can search for an email address by using the Search field. Addresses can be sorted alphanumerically or by creation date in ascending or descending order.

3. In the confirmation dialog box, click **OK**. The email address is removed from the Suppression List.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations to manage your suppressions:

- CreateSuppression
- GetSuppression
- ListSuppressions
- DeleteSuppression

Deliverability Best Practices

Deliverability Best Practices help you to learn and manage the habits that affect your sending reputation. These six recommendations can help lower your email bounce rate, stay off blacklists, lower your complaint rate, and improve your email sender reputation.

Implement an Opt-in Process

An opt-in process is a method for your users to subscribe to your mailing list, which gives you permission to send messages. Only send messages to subscribers who have opted-in to your mailing list. There are two types of opt-in procedures.

- **Single opt-in (unconfirmed):** A user provides their email address and gives permission to receive relevant messages. Once the address is provided, messages can be sent without confirming the email address belongs to the user who provided it.
- **Double opt-in (confirmed):** A user provides their email address, but before the first mailing, a confirmation email is sent to the account owner. The email requires action from the account owner to confirm that future messages are wanted. An account can be verified by having the owner click a link for reply to the email. The confirmation email ensures that the address was not added to a third-party mailing list without consent.

Purge Unengaged Users

Remove unengaged users by implementing a process. If a recipient is not engaging with your mail by either opening or clicking the email, this might be an indication that the email account is not in use or that the recipient is no longer interested in your content. If the recipient does not use the email account, eventually the mailbox provider terminates the account or transforms the account into a spam trap. Remove recipients who have not engaged with your email in a time frame defined by your business model. Purging unengaged users helps your deliverability by increasing your user engagement rate.

Review Your Subscriber List

When reviewing your subscriber list, keep these things in mind:

- Eliminate duplicate addresses before sending. If addresses that do not exist are mailed to multiple times, your hard bounce rate could be inflated.
- Ensure that a previous suppression list (possibly from another email service provider) was not accidentally included.
- Verify that subscribers have opted-in. Do not send to an old list that you found.
- Restrict users from uploading their email client's contact list in a "select all" fashion. Forcing users to select addresses individually prevents users from accidentally including potentially out of date or expired addresses.

Evaluate Your Sending Frequency

Sending too many emails in a short time might aggravate recipients, causing the recipients to mark your messages as spam. This is called list fatigue. Ensure that your message cadence aligns with the expected frequency of your content. Reducing frequency might reduce spam complaints. Ensure that your content is relevant to your subscribers. Keep your email messages consistent to your audience. A person who subscribed to a list for coupon updates might not want regular emails about auto loan finance rates. These unexpected messages are likely to be marked as spam, which decreases your sender reputation.

Easily Accessible Unsubscribe URL

Unsubscribing helps your inbox success by sending only to recipients that engage by opening or clicking. When people complain, your sending reputation is harmed. Make it easy for recipients to be removed from the list. Do not hide the unsubscribe URL at the bottom of the message. A small percentage of users scroll to the bottom of the email and search for a small URL. Most users mark the email as spam.

Canadian Anti-Spam Law (CASL) Guide

Canada's Anti-Spam Law (CASL) is one of the best guides to ensuring your compliance with the law, users' desire, and the intended filtering that most mailbox providers use. If you are a Canadian email sender or you send email to Canadian residents, you must comply with CASL. The following information is intended to help provide you with some guidance for complying with CASL. This article does not constitute legal advice, nor is it intended supplement or otherwise affect your rights or obligations under your service agreement with Oracle, including your obligations under Oracle's Acceptable Use Policy. If you have questions about CASL or the legality of your sending practices, we encourage you to speak with an attorney who specializes in that subject matter.

What is covered by CASL?

CASL and its related regulations apply to any "commercial electronic message" sent from or to Canadian computers and devices in Canada. Electronic messages that are merely routed through Canadian computer systems are not subject to CASL.

A "commercial electronic message" is any message that:

- Is in an electronic format, including emails, instant messages, text messages, and some social media communications.
- Is sent to an electronic address, including email addresses, instant message accounts, phone accounts, and social media accounts; and
- Contains a message encouraging recipients to take part in some type of commercial activity, including the promotion of products, services, people/personas, companies, or organizations.

Are there any types of messages that are exempt from CASL?

These types of electronic messages are exempt from CASL for various reasons.

- Messages to family or a person with established personal relationship.
- Messages to an employee, consultant, or person associated with your business.
- Responses to a current customer, or someone who has inquired in the last six months.
- Messages that will be opened or accessed in a foreign country, including the U.S., China, and most of Europe.
- Messages sent on behalf of a charity or political organization for the purposes of raising funds or soliciting contributions.
- Messages attempting to enforce a legal right or court order.
- Messages that provide warranty, recall, safety, or security information about a product or service purchased by the recipient.
- Messages that provide information about a purchase, subscription, membership, account, loan, or other ongoing relationship, including delivery of product updates or upgrades.
- A single message to a recipient without an existing relationship based on a referral. The full name of the referring person must be disclosed in the message. The referrer might be family or have another relationship with the person to whom you are sending.

If your message does not meet one of these criteria, consent is required under CASL. Not all of the previous messages listed are permitted under the Oracle Cloud Hosting and Delivery Policy.

What is "express consent"?

Under CASL, "express consent" means a written or oral agreement to receive specific types of messages. For example, "You want to receive monthly newsletters and weekly discount notifications from Oracle".

Express consent is only valid if your request for consent clearly and simply describes the following information:

- Your purpose in obtaining consent.
- A description of messages you will be sending.
- The name and contact information (physical mailing address and telephone number, email address, or website URL) of the requestor.
- A statement that the recipient can unsubscribe at any time.

The requestor can be you or someone for whom you are asking. If you are requesting consent on behalf of a client, the name and contact information of the client must be included with the consent request.

What is "implied consent"?

Under CASL, you can only obtain implied consent when certain circumstances exist, including when:

- A recipient has purchased a product, service or made another business deal, contract, or membership with your organization in the last 24 months.
- You are a registered charity or political organization, and the recipient has made a donation or gift, has volunteered, or attended a meeting organized by you.
- A professional message is sent to someone whose email address was given to you, or is conspicuously published, and who has not published or told you that unsolicited messages are not wanted.

What type of consent is required?

After July 1, 2017, you can only send to recipients with express consent or whose implied consent is valid under CASL.

Some additional requirements

In addition to understanding what qualifies as CASL-regulated message, and what type of consent is needed, there are a few other details to keep in mind.

- Retention of a record of consent confirmations is required.
- When requesting consent, checkboxes cannot be pre-filled to suggest consent. Each subscriber must check the box themselves for consent to be valid.

- All messages sent must include the following:
  - your name
  - the person on whose behalf you are sending (if any)
  - your physical mailing address and telephone number
  - your email address or website URL
- All messages sent after consent must also include an unsubscribe mechanism, and unsubscribes must be processed within ten days.

Where can I find more information on CASL?

The full text of the law can be found on the website for the Canadian Justice Department. The Canadian Radio and Telecommunications Commission has also set up an FAQ page and some guidelines for obtaining consent. If you have any questions, we encourage you to contact an attorney who is familiar with the law.

Oracle Cloud Hosting and Delivery Policy

Often, the Oracle Cloud Hosting and Delivery Policy is more stringent than CASL requirements. It is important that you review Oracle policies before using the service.

Troubleshooting Undelivered Emails

The following issues can cause an email to be undelivered:

- The recipient is on the Suppression List.
- An authentication failure or an issue with the format of the email message occurred. For example, if the SMTP "From" address is not the same as the "From" address in the email body, the email is rejected. The addresses must match and be an Approved Sender. Refer to your sending application's logs to review any issues.

If you are unable to resolve the issue, you can go to My Oracle Support and create a service request. See Creating a Service Request for more information.

CHAPTER 12 File Storage

This chapter explains how to create file systems, how to manage them, and how to mount them to write files.

Overview of File Storage

Oracle Cloud Infrastructure File Storage service provides a durable, scalable, secure, enterprise-grade network file system. You can connect to a File Storage service file system from any bare metal, virtual machine, or container instance in your Virtual Cloud Network (VCN). You can also access a file system from outside the VCN using Oracle Cloud Infrastructure FastConnect and Internet Protocol security (IPSec) virtual private network (VPN).

Large Compute clusters of thousands of instances can use the File Storage service for high-performance shared storage. Storage provisioning is fully managed and automatic as your use scales from a single byte to exabytes without upfront provisioning. You have redundant storage for resilient data protection.

The File Storage service supports the Network File System version 3.0 (NFSv3) protocol. The service supports the Network Lock Manager (NLM) protocol for file locking functionality.

Use the File Storage service when your application or workload includes big data and analytics, media processing, or content management, and you require Portable Operating System Interface (POSIX)-compliant file system access semantics and concurrently accessible storage. The File Storage service is designed to meet the needs of applications and users that need an enterprise file system across a wide range of use cases, including the following:

- **General Purpose File Storage:** Access to an unlimited pool of file systems to manage growth of structured and unstructured data.
- **Big Data and Analytics:** Run analytic workloads and use shared file systems to store persistent data.

- **Lift and Shift of Enterprise Applications:** Migrate existing Oracle applications that need NFS storage, such as Oracle E-Business Suite and PeopleSoft.
- **Databases and Transactional Applications:** Run test and development workloads with Oracle, MySQL, or other databases.
- **Backups, Business Continuity, and Disaster Recovery:** Host a secondary copy of relevant file systems from on premises to the cloud for backup and disaster recovery purposes.
- **MicroServices and Docker:** Deliver stateful persistence for containers. Easily scale as your container-based environments grow.

Tip

Watch a video introduction to the service and its capabilities.

File Systems Concepts

Using the File Storage service requires an understanding of the following concepts, including some that pertain to Oracle Cloud Infrastructure Networking:

MOUNT TARGET

An NFS endpoint that lives in a subnet of your choice and is highly available. The mount target provides the IP address or DNS name that is used in the mount command when connecting NFS clients to a file system. A single mount target can export many file systems. By default, you can create two mount targets per account per availability domain, but you can request an increase. See Service Limits for a list of applicable limits and instructions for requesting a limit increase. See Managing Mount Targets for more information about working with this resource.

Export

Exports control how NFS clients access file systems when they connect to a mount target. File systems are exported (made available) through mount targets. Each mount target maintains an export set which contains one or many exports. A file system must have at least one export in one mount target in order for instances to mount the file system. The information used by an export includes the file system OCID, mount target OCID, export set OCID, export path, and client export options. For more information, see Managing Mount Targets.

Export Set

Collection of one or more exports that control what file systems the mount target exports using NFSv3 protocol and how those file systems are found using the NFS mount protocol. Each mount target has an export set. Each file system associated with the mount target has at least one export in the export set.

Export Path

A path that is specified when an export is created. It uniquely identifies the file system within the mount target, letting you associate up to 100 file systems to a single mount target. This path is unrelated to any path within the file system itself, or the client mount point path.

The File Storage service adds an export that pairs the file system's Oracle Cloud Identifier (OCID) and path.

See Paths in File Systems for more information.

Export Options

NFS export options are a set of parameters within the export that specify the level of access granted to NFS clients when they connect to a mount target. An NFS export options entry within an export defines access for a single IP address or CIDR block range. For more information, see Working with NFS Export Options.

Virtual Cloud Network (VCN)

A private network that you set up in the Oracle data centers, with firewall rules and specific types of communication gateways that you can choose to use. A VCN covers a single, contiguous IPv4 CIDR block of your choice. For more information about VCNs, see VCNs and Subnets in the Oracle Cloud Infrastructure Networking documentation.

You can set up a service gateway and give your VCN private access to the File Storage service. A service gateway can be used only by resources in the gateway's own VCN. Traffic to the service will not travel through the internet. When creating the service gateway, enable the service label called **All <region> Services in Oracle Services Network**. It includes the File Storage service. Be sure to update route tables for any subnets that need to access File Storage through the service gateway.

For more information and detailed instructions, see Setting Up a Service Gateway in the Console

Subnets

Subdivisions you define in a VCN (for example, 10.0.0.0/24 and 10.0.1.0/24). Subnets contain virtual network interface cards (VNICs), which attach to instances. A subnet can span a region or exist in a single availability domain . A subnet consists of a contiguous range of IP addresses that do not overlap with other subnets in the VCN. For each subnet, you specify the routing rules and security lists that apply to it. For more information about subnets, see VCNs and Subnets in the Oracle Cloud Infrastructure Networking documentation.

SECURITY LISTS

Virtual firewall rules for your VCN. Your VCN comes with a default security list, and you can add more. These security lists provide ingress and egress rules that specify the types of traffic allowed in and out of the instances. You can choose whether a given rule is stateful or stateless. Security list rules must be set up so that clients can connect to file system mount targets. For more information about how security lists work in Oracle Cloud Infrastructure, see Security Lists in the Networking documentation. For information about setting up specific security list rules required for mount target traffic, see Configuring VCN Security List Rules for File Storage. About Security explains how security lists interact with other types of security in your file system.

SNAPSHOTS

Snapshots provide a consistent, point-in-time view of your file system, and you can take as many snapshots as you need. You pay only for the storage used by your data and metadata, including storage capacity used by snapshots. Each snapshot reflects only data that changed from the previous snapshot. For more information, see Managing Snapshots.

Encryption

All files are encrypted at rest by default.

Data Transfers

FastConnect offers you the ability to accelerate data transfers. You can leverage the integration between FastConnect and the File Storage service to perform initial data migration, workflow data transfers for large files, and disaster recovery scenarios between two regions, among other things.

File Storage Space Allocation

The File Storage service allocates space in blocks of variable size in a way that is fine-tuned to minimize total customer cost and optimize performance for modern workloads. The minimum block size used is 8192 bytes. For example, if you create a 1-byte file, we allocate

8192 bytes. We use larger blocks to store larger files. This method of allocation might cause a different block count for files than expected after they are copied from another storage device to your Oracle Cloud Infrastructure file system.

How File Storage Permissions Work

File Storage service resources include file systems, mount targets, and export sets. The AUTH_UNIX style of authentication and permission checking is supported for remote NFS client requests. You use Oracle Cloud Infrastructure Identity and Access Management (IAM) policy language to define access to Oracle Cloud Infrastructure resources. You can consider exports and snapshots subsidiary resources of export sets and file systems, respectively. As such, they do not need their own permissions. Related resources include Oracle Cloud Infrastructure Compute instances and Oracle Cloud Infrastructure Networking virtual cloud networks (VCNs).

Oracle Cloud Infrastructure users require resource permissions to create, delete, and manage resources. Without the appropriate IAM permissions, you cannot export a file system through a mount target. Until a file system has been exported, Compute instances cannot mount it. For more information about creating an IAM policy, see Let users create, manage, and delete file systems.

If you have successfully exported a file system on a subnet, then you use Networking security lists to control traffic to and from the subnet and, therefore, the mount target. Security lists act as a virtual firewall, allowing only the network traffic you specify to and from the IP addresses and port ranges configured in your ingress and egress rules. The security list you create for the subnet lets hosts send and receive packets and mount the file system. If you have firewalls on individual instances, use FastConnect, or use a virtual private network (VPN), the settings for those might also impact security at the networking layer. For more information about creating a security list for the File Storage service, see Creating File Systems. See About Security for more information on how different types of security work together in your file system.

Regions and Availability Domains

You can use the File Storage service in all regions. For a list of supported regions, see Regions and Availability Domains.

You can share mount targets for file systems among local bare metal and virtual Compute resources within a region. When you create file systems and mount targets, you specify the availability domain they are created in. While it is possible to access mount targets from any AD in a region, for optimal performance, place File Storage resources in the same availability domain as the Compute instances that access them.

Subnets can be either AD-specific or regional. You can create File Storage resources in either type of subnet. Regional subnets allow Compute instances to connect to any mount target in the subnet regardless of AD, with no additional routing configuration. However, to minimize latency, place mount targets in the same AD as Compute instances just as you would in an AD-specific subnet. For more information, see About Regional Subnets.

Within an availability domain, the File Storage service uses synchronous replication and high availability failover to keep your data safe and available.

Resource Identifiers

Most types of Oracle Cloud Infrastructure resources have a unique, Oracle-assigned identifier called an Oracle Cloud ID (OCID). For information about the OCID format and other ways to identify your resources, see Resource Identifiers.

Ways to Access Oracle Cloud Infrastructure

You can access Oracle Cloud Infrastructure using the Console (a browser-based interface) or the REST API. Instructions for the Console and API are included in topics throughout this guide. For a list of available SDKs, see Software Development Kits and Command Line Interface.

To access the Console, you must use a supported browser. Oracle Cloud Infrastructure supports the latest desktop versions of Google Chrome, Microsoft Edge, Internet Explorer 11,

Safari, Firefox, and Firefox ESR. Note that private browsing mode is not supported for Firefox, Internet Explorer, or Edge. Mobile browsers are not supported.

Authentication and Authorization

Each service in Oracle Cloud Infrastructure integrates with IAM for authentication and authorization, for all interfaces (the Console, SDK or CLI, and REST API).

An administrator in your organization needs to set up groups, compartments, and policies that control which users can access which services, which resources, and the type of access. For example, the policies control who can create new users, create and manage the cloud network, launch instances, create buckets, download objects, etc. For more information, see Getting Started with Policies. For specific details about writing policies for each of the different services, see Policy Reference.

If you're a regular user (not an administrator) who needs to use the Oracle Cloud Infrastructure resources that your company owns, contact your administrator to set up a user ID for you. The administrator can confirm which compartment or compartments you should be using.

Limits on Your File Storage Components

See Service Limits for a list of applicable limits and instructions for requesting a limit increase.

About Security

The File Storage service uses four different layers of security. Each layer has its own authorization entities and methods which are separate from the other layers.

Tip

Watch a video about security in File Storage.

The **Oracle Cloud Infrastructure (OCI) policy** layer uses policies to control what users can do within Oracle Cloud Infrastructure, such as creating instances, a VCN and its security rules, mount targets, and file systems.

The **Network security** layer controls which instance IP addresses or CIDR blocks can connect to a host file system. It uses VCN security list rules to allow or deny traffic to the mount target, and therefore access to any associated file system.

The **NFS export option** layer is a method of applying access control per-file system export based on source IP address that bridges the Network Security layer and the NFS v.3 Unix Security layer.

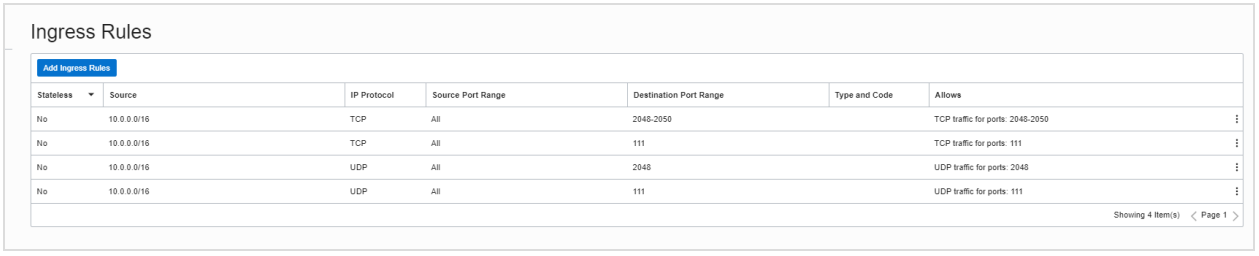
The **NFS v.3 Unix security** layer controls what users can do on the instance, such as installing applications, creating directories, mounting external file systems by a local mount point, and reading and writing files.

This security layer...	Uses these...	To control actions like...
Oracle Cloud Infrastructure (Oracle Cloud Infrastructure)	OCI Users and policies	Creating instances and VCNs. Creating, listing, and associating file systems and mount targets.
Network security	IP addresses, CIDR blocks, security lists	Connecting the client instance to the mount target.

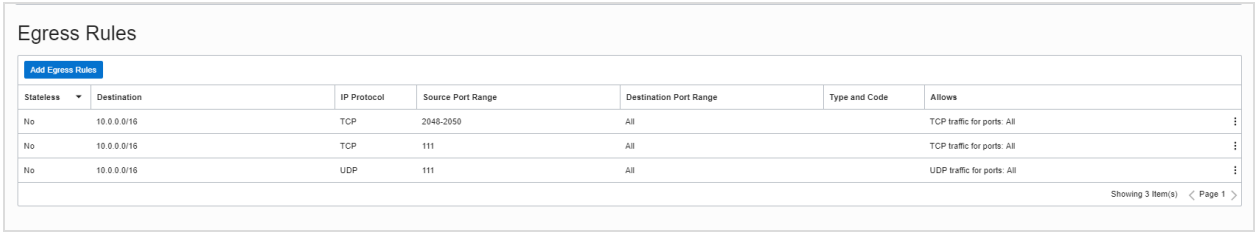
This security layer...	Uses these...	To control actions like...
NFS export options	File system exports, IP addresses, Unix users	Privileged source port connection, reading and writing files, and limiting root user access on a per-file system basis.
NFS v.3 Unix security	Unix users, file mode bits	Mounting file systems, reading and writing files.

You create users and groups in Oracle Cloud Infrastructure. Then, you can use policies to specify which users and groups can create, access, or modify resources such as file systems, mount targets, and export options.

The network security layer allows you to use VCN security lists to block the appropriate ports from specific IP addresses and CIDR blocks and restrict host access. However, it's on an 'all or nothing' basis - the client either can or cannot access the mount target, and therefore all file systems associated with it. See Working with NFS Export Options to specify granular controls on a per-file system basis.



File Storage service supports the AUTH_UNIX style of authentication and permission checking for remote NFS client requests. When mounting file systems, we recommend that you use the `-nosuid` option. This option disables set-user-identifier or set-group-identifier bits. Remote users are prevented from gaining higher privileges using a `setuid` program. For more information, see Mounting File Systems.



Remember that users in UNIX aren't the same as users in Oracle Cloud Infrastructure - they're not linked or associated in any way. The Oracle Cloud Infrastructure policy layer doesn't govern anything that happens inside the file system, the UNIX security layer does. Conversely, the UNIX security layer doesn't govern creating file systems or mount targets in Oracle Cloud Infrastructure.

NFS export options are a method of applying access control at the network security layer and the NFS v.3 Unix security layer. You can use NFS export options to limit access levels by IP addresses or CIDR blocks connecting to multiple file systems through exports of an associated mount target. Access can be restricted so that each client's file system is inaccessible and invisible to the other, allowing for managed hosted environment security. Moreover, you can set permissions for read-only, read/write, or root-squash for your file systems. See Working with NFS Export Options for more information.

Configuring VCN Security List Rules for File Storage

When you create a VCN, a default security list is also created. Rules in the security list are used to allow or deny traffic to a subnet. Before you can mount a file system, you must configure security list rules to allow traffic to the mount target subnet. File Storage requires stateful ingress to TCP ports 111, 2048, 2049, and 2050 and stateful ingress to UDP ports 111 and 2048. File storage also requires stateful egress from TCP ports 111, 2048, 2049, and 2050 and stateful egress from UDP port 111.

See Security Lists for more information about how security lists work in Oracle Cloud Infrastructure. See About Security for information about how security lists work with other types of security in File Storage.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let network admins manage a cloud network covers management of all networking components, including security lists. See the Policy Reference for more information.

If you're new to policies, see Getting Started with Policies and Common Policies.

Using the Console

To configure security list rules for mount target traffic

Security list rules allow ingress and egress for the following:

- Open Network Computing Remote Procedure Call (ONC RPC) rpcbind utility protocol
- Network File System (NFS) protocol
- Network File System (MOUNT) protocol
- Network Lock Manager (NLM) protocol

1. Open the navigation menu. Under **Core Infrastructure**, go to **Networking** and click **Virtual Cloud Networks**.
2. In the **Scope** section, select the compartment that contains the subnet associated with your file system.
3. Click the name of the cloud network associated with your file system.

4. On the details page for the cloud network, in **Resources**, and then click **Security Lists**.
5. Click the name of the security list used by the subnet associated with your file system.
6. In **Resources**, click **Ingress Rules**.
7. Click **Add Ingress Rules** and add the following ingress rule allowing **TCP** traffic.
    - Specify that it's a stateful rule by leaving the check box clear. (For more information about stateful and stateless rules, see Stateful vs. Stateless Rules). By default, rules are stateful unless you specify otherwise.
    - To allow traffic from the subnet of the cloud network, click **Source Type**, choose **CIDR**, and then enter the CIDR block for the subnet.
    - Click **IP Protocol**, and then click **TCP**.
    - In **Source Port Range**, specify the range of ports that you want to allow traffic from. Alternatively, accept the default of **All** to allow traffic from any source port.

      Important

      We recommend that NFS clients be limited to reserved ports. To do this, set the **Source Port** range to **1-1023**. You can also set export options for a file system to require clients to connect from a privileged source port. For more information, see Working with NFS Export Options.
    - Click **Destination Port Range**, and then enter **2048-2050**.
8. Click **+ Additional Ingress Rule** and create a second stateful ingress rule allowing **TCP** traffic to a **Destination Port Range** of **111**.
9. Click **+ Additional Ingress Rule** and create a third stateful ingress rule allowing **UDP** traffic to a **Destination Port Range** of **2048**.

10. Click **+ Additional Ingress Rule** and create a fourth stateful ingress rule allowing **UDP** traffic to a **Destination Port Range** of **111**.
11. When you're done, click **Add Ingress Rules**.
12. Next, create the egress rules. In **Resources**, click **Egress Rules**.
13. Click **Add Egress Rules** and add the following egress rule allowing **TCP** traffic:
    - Specify that it's a stateful rule by leaving the check box clear.
    - Click **Destination Type**, choose **CIDR**, and then enter the CIDR block for the subnet.
    - Click **IP Protocol**, and then click **TCP**.
    - In **Source Port Range**, enter **2048-2050**.
    - In **Destination Port Range**, accept the default of **All** to allow traffic to any destination port.
14. Click **+ Additional Ingress Rule** and add a second stateful egress rule allowing **TCP** traffic from a **Source Port Range** of **111**.
15. Click **+ Additional Ingress Rule** and add a third stateful egress rule allowing **UDP** traffic from a **Source Port Range of 111**.
16. When you're done, click **Add Egress Rules**.

Next steps:

- Create a mount target and associated file system
- Mount a file system

Working with NFS Export Options

This topic describes the basic features of NFS export options, and how to control client access to your file system.

Overview

NFS export options enable you to create more granular access control than is possible using just security list rules to limit VCN access. You can use NFS export options to specify access levels for IP addresses or CIDR blocks connecting to file systems through exports in a mount target. Access can be restricted so that each client's file system is inaccessible and invisible to the other, providing better security controls in multi-tenant environments.

Using NFS export option access controls, you can limit clients' ability to connect to the file system and view or write data. For example, if you want to allow clients to consume but not update resources in your file system, you can set access to Read Only. You can also reduce client root access to your file systems and map specified User IDs (UIDs) and Group IDs (GIDs) to an anonymous UID/GID of your choice. For more information about how NFS export options work with other security layers, see About Security.

Tip

Watch a video about working with NFS export options in File Storage.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don't have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users create, manage, and delete file systems allows users to manage NFS export options.

If you're new to policies, see Getting Started with Policies and Common Policies.

Exports

Exports control how NFS clients access file systems when they connect to a mount target. File systems are exported (made available) through mount targets. Each mount target maintains an export set which contains one or many exports. A file system may be exported through one or more mount targets. A file system must have at least one export in one mount target in order for instances to mount the file system. The information used by an export includes the file system OCID, mount target OCID, export set OCID, export path, and client export options. Typically, an export is created in a mount target when the file system is created. Thereafter, you can create additional exports for a file system in any mount target that resides in the same availability domain as the file system.

See To create an export for a file system for more information.

NFS Export Options

NFS export options are a set of parameters within the export that specify the level of access granted to NFS clients when they connect to a mount target. An NFS export options entry within an export defines access for a single IP address or CIDR block range.

Each separate client IP address or CIDR block you want to define access for needs a separate export options entry in the export. For example, if you want to set options for NFS client IP addresses 10.0.0.6, 10.0.08, and 10.0.0.10, you need to create three separate entries, one for each IP address.

File Storage service considers the listed order of each export options entry for the export. During an NFS request by a client, File Storage service applies the first set of options that matches the client Source IP address. Only the first set is applied; the rest are ignored.

For example, consider the following two export options entries specifying access for an export:

Entry 1: Source: 10.0.0.0/16, Access: Read Only

Entry 2: Source: 10.0.0.8, Access: Read/Write

In this case, clients who connect to the export from IP address 10.0.0.8 have Read Only access. The request Source IP address is contained in the CIDR block specified in the first entry, and File Storage Service applies the options in the first match.

Important

File systems can be associated with one or more exports, contained within one or more mount targets. If the client **source** IP address does not match any entry on the list for a single export, then that export is not visible to the client. However, the file system could be accessed through other exports on the same or other mount targets. **To completely deny client access to a file system, be sure that the client source IP address or CIDR block is not included in any export for any mount target associated with the file system.**

The following options can be set to control export access:

- **Source**: The IP address or CIDR block of a connecting NFS client.
- **Require Privileged Source Port (true/false):** This setting determines whether the NFS clients specified in **source** are required to connect from a privileged source port. Privileged ports are any port including 1-1023. On Unix-like systems, only the root user can open privileged ports. Setting this value to **true** disallows requests from unprivileged ports. The default for this setting is different depending on how the export is created. Creating an export without an explicit `ClientOption` array sets the `requirePrivilegedSourcePort` attribute of the client option to **false**. When you create a `ClientOption` array explicitly , `requirePrivilegedSourcePort` defaults to **true**. For example, creating an export in the Console using the default selections sets `requirePrivilegedSourcePort` to **false**. Creating an export in the API along with a `ClientOption` array sets `requirePrivilegedSourcePort` to **true**.

Important

When **Require Privileged Source Port** is set to **true**, you also have to follow these additional configuration steps:

1. When mounting the file system from a Unix-like system, include the `resvport` option in your mount command when mounting. For example:

   ```
   sudo mount -o resvport 10.x.x.x:/fs-export-path
   /mnt/yourmountpoint
   ```

   For more information, see Mounting File Systems From Unix-Style Instances.
2. When mounting the file system from a Windows system, be sure the **UseReserverdPort**s registry key value is set to **1**.
   For more information, see Mounting File Systems From Windows Instances.

- **Access (Read_Only, Read_Write):** This setting specifies the **source** NFS client access. If unspecified, defaults to **Read_Write**.
- **Identity Squash: (All, Root, None):** This setting determines whether the **source** clients accessing the file system have their User ID (UID) and Group ID (GID) remapped to **anonymousUid** and **anonymousGid**. If you choose **All**, all users and groups are remapped. If **Root**, only the root user UID/GID combination 0/0 is remapped. If **None**, no users are remapped. If unspecified, defaults to **None**.
- **anonymousUid:** This setting is used along with the **Identity Squash** option. When remapping users, you can use this setting to change the default anonymousUid of **65534** to any user ID of your choice.

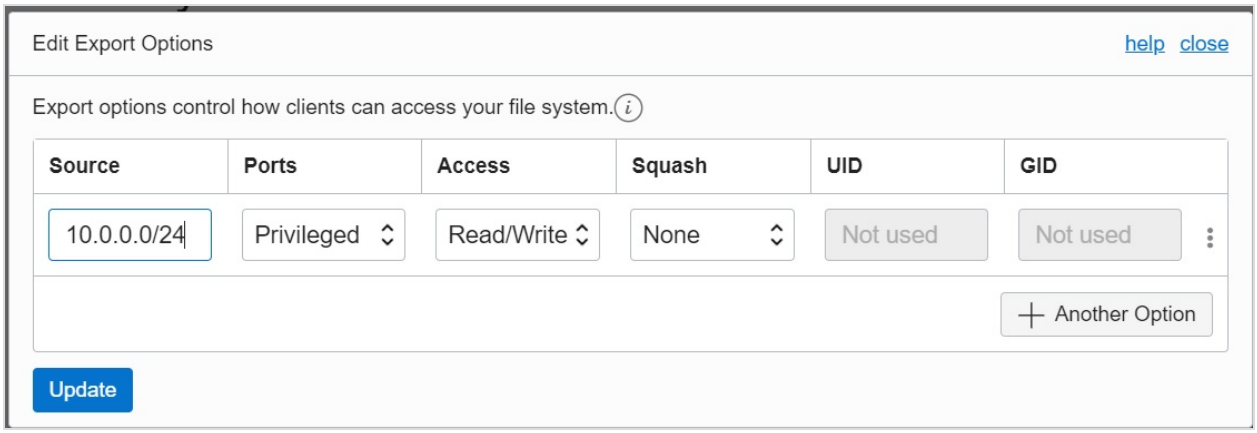
- **anonymousGid**: This setting is used along with the **Identity Squash** option. When remapping groups, you can use this setting to change the default anonymousGid of **65534** to any group ID of your choice.

Typical Access Control Scenarios

When you create file system and export, the NFS export options for that file system are set to the following defaults, which allow full access for all NFS client source connections. These defaults must be changed if you want to restrict access:

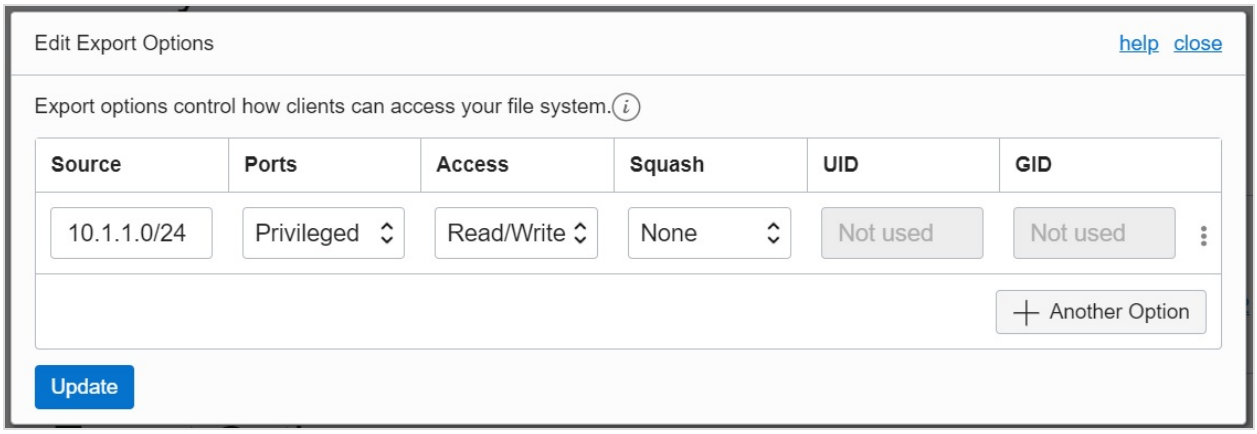
- **Source:** 0.0.0.0/0 (All)
- **Require Privileged Source Port:** False
- **Access:** Read_Write
- **Identity Squash:** None

Scenario A: Control Host Based Access



Provide a managed hosted environment for two clients. The clients share a mount target, but each has their own file system, and cannot access each other's data. For example:

- Client A, who is assigned to CIDR block 10.0.0.0/24, requires Read/Write access to file system A, but not file system B.
- Client B, who is assigned to CIDR block 10.1.1.0/24, requires Read/Write access to file system B, but not file system A.
- Client C, who is assigned to CIDR block 10.2.2.0/24, has no access of any kind to file system A or file system B.
- Both file systems A and B are associated to a single mount target, MT1. Each file system has an export contained in the export set of MT1.



Since Client A and Client B access the mount target from different CIDR blocks, you can set the client options for both file system exports to allow access to only a single CIDR block. Client C is denied access by not including its IP address or CIDR block in the NFS export options for any export of either file system.

Console Example

Set the export options for file system A to allow Read/Write access only to Client A, who is assigned to CIDR block 10.0.0.0/24. Client B and Client C are not included in this CIDR block, and cannot access the file system.

Set the export options for file system B to allow Read/Write access only to Client B, who is assigned to CIDR block 10.1.1.0/24. Client A and Client C are not included in this CIDR block, and cannot access the file system.

CLI Example

Set the export options for file system A to allow Read_Write access only to Client A, who is assigned to CIDR block 10.0.0.0/24. Client B and Client C are not included in this CIDR block, and cannot access the file system.

```
oci fs export update --export-id <File_system_A_export_ID> --export-options '
[{"source":"10.0.0.0/24","require-privileged-source-port":"true","access":"READ_WRITE","identity-
squash":"NONE","anonymous-uid":"65534","anonymous-gid":"65534"}]'
```

Set the export options for file system B to allow Read_Write access only to Client B, who is assigned to CIDR block 10.1.1.0/24. Client A and Client C are not included in this CIDR block, and cannot access the file system.

```
oci fs export update --export-id <File_system_B_export_ID> --export-options '[{"source":"10.1.1.0/24
","require-privileged-source-port":"true","access":"READ_WRITE","identity-squash":"NONE","anonymous-
uid":"65534","anonymous-gid":"65534"}]'
```

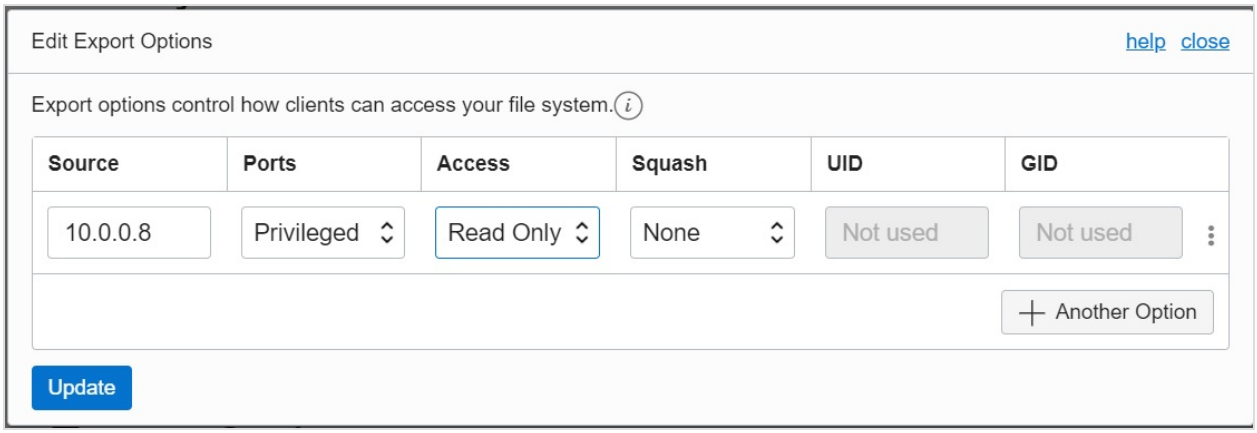
API Example

Set the export options for file system A to allow READ_WRITE access only to Client A, who is assigned to CIDR block 10.0.0.0/24. Client B and Client C are not included in this CIDR block, and cannot access the file system.

```
PUT/<Current_API_Version>/exports/<File_System_A_export_OCID>
Host: filestorage.us-phoenix-1.oraclecloud.com
<authorization and other headers>
{
    "exportOptions": [
        {
          "source": "10.0.0.0/24",
          "requirePrivilegedSourcePort": true,
          "access": "READ_WRITE",
          "identitySquash": "NONE",
          "anonymousUid": 65534,
          "anonymousGid": 65534
        }
    ]
}
```

Set the export options for file system B to allow READ_WRITE access only to Client B, who is assigned to CIDR block 10.1.1.0/24. Client A and Client C are not included in this CIDR block, and cannot access the file system.

```
PUT/<Current_API_Version>/exports/<File_System_B_export_OCID>
Host: filestorage.us-phoenix-1.oraclecloud.com
<authorization and other headers>
{
    "exportOptions": [
        {
          "source": "10.1.1.0/24",
          "requirePrivilegedSourcePort": true,
          "access": "READ_WRITE",
          "identitySquash": "NONE",
          "anonymousUid": 65534,
          "anonymousGid": 65534
        }
    ]
}
```



Scenario B: Limit the Ability to Write Data

Provide data to customers for consumption, but don't allow them to update the data.

For example, you'd like to publish a set of resources in file system A for an application to consume, but not change. The application connects from IP address 10.0.0.8.

Console Example

Set the source IP address 10.0.0.8 to Read Only in the export for file system A:

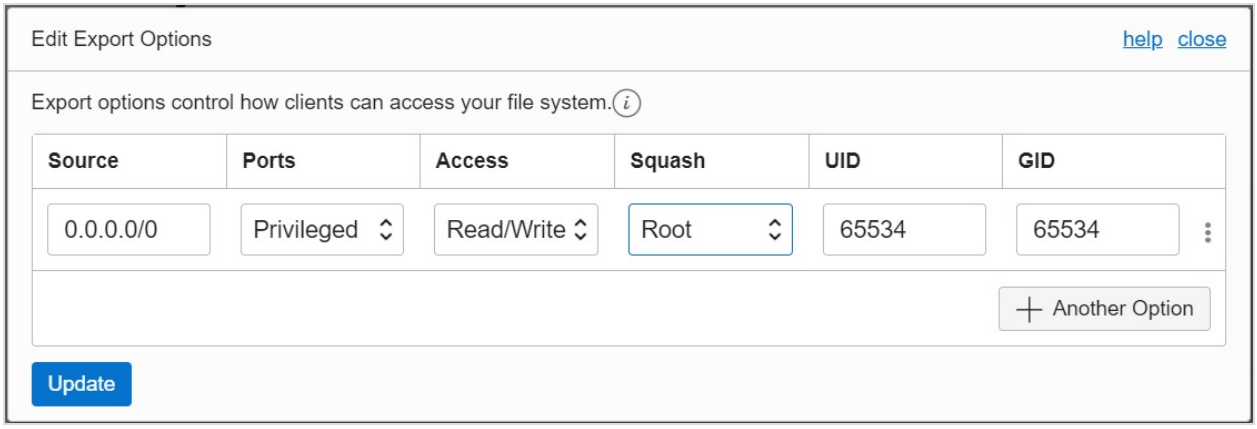
CLI Example

Set the source IP address 10.0.0.8 to READ_ONLY in the export for file system A:

```
oci fs export update --export-id <File_System_A_export_OCID> --export-options '
[{"source":"10.0.0.8","require-privileged-source-port":"true","access":"READ_
ONLY","identitysquash":"NONE","anonymousuid":"65534","anonymousgid":"65534"}]'
```

API Example

Set the source IP address 10.0.0.8 to READ_ONLY in the export for file system A:



```
PUT/<Current_API_Version>/exports/<File_System_A_export_OCID>
Host: filestorage.us-phoenix-1.oraclecloud.com
<authorization and other headers>
{
    "exportOptions": [
        {
          "source": "10.0.0.8",
          "requirePrivilegedSourcePort": true,
```

```
          "access": "READ_ONLY",
          "identitySquash": "NONE",
          "anonymousUid": 65534,
          "anonymousGid": 65534
        }
    ]
}
```

SCENARIO C: IMPROVE FILE SYSTEM SECURITY

To increase security, you'd like to limit the root user's privileges when connecting to File System A. Use Identity Squash to remap root users to UID/GID 65534. In Unix-like systems, this UID/GID combination is reserved for '*nobody*', a user with no system privileges.

Console Example

CLI Example

```
oci fs export update --export-id <File_System_A_export_OCID> --export-options '
[{"source":"0.0.0.0/0","require-privileged-source-port":"true","access":"READ_
WRITE","identitysquash":"ROOT","anonymousuid":"65534","anonymousgid":"65534"}]'
```

API Example

```
PUT/<Current_API_Version>/exports/<File_System_A_export_OCID>
Host: filestorage.us-phoenix-1.oraclecloud.com
<authorization and other headers>
{
    "exportOptions": [
        {
          "source": "0.0.0.0/0",
          "requirePrivilegedSourcePort": true,
          "access": "READ_WRITE",
          "identitySquash": "ROOT",
          "anonymousUid": 65534,
          "anonymousGid": 65534
        }
    ]
}
```

Tip

If you don't want a file system to be visible to any clients, you can set all of the properties in the `exportOptions` array to empty values. For example,

```
{
   "exportOptions": [
     {
      "source":"",
      "requirePrivilegedSourcePort":"",
      "access": "",
      "identitySquash":""}
]
```

Using the Console

To set export options for a file system

1. Open the navigation menu. Under **Core Infrastructure**, click **File Storage** and then click **File Systems**.
2. In the **List Scope** section, select a compartment. All of the file systems in the selected compartment are displayed.
3. Find the file system you want to set export options for, click the the Actions icon (three dots), and then click **View File System Details**.
4. In the **Exports** list, find the export you want to set export options in, click the the Actions icon (three dots), and then click **View Export Details**. If there is no export listed for the file system, you can create one. See To create an export for a file system for more information.

Tip

To be sure you be sure that you select export, check the following:

- **The export path:** This path uniquely identifies the file system within the mount target. No two exports in a mount target can have the same export path, even if the exports are for the same file system.
- **The mount target name:** File systems can be exported through more than one mount target. Be sure that you've selected the export for the correct mount target.

5. Click **Edit Export Options**.
6. Make one or more of these changes:

- Change an export option entry in the list.
- Click **+Another Option** to create a new export option entry.
- Click the Actions icon (three dots) for an entry and move it up or down in the list.

7. When you're done, click **Update**.

Using the CLI

For information about using the CLI, see Command Line Interface (CLI).

To create an export

Open a command prompt and run `oci fs export create` to create an export for a specified file system within a specified export set. This example creates an export along with its NFS export options.

For example:

```
oci fs export create --export-set-id <export_set_OCID> --file-system-id <file_system_OCID> --path
"</pathname>" --export-options '
[{"source":"10.0.0.0/16","requireprivilegedsourceport":"true","access":"READWRITE","identitysquash":"NO
NE","anonymousuid":"0","anonymousgid":"0"}]'
```

Important

Export Path Names

The path must start with a slash (/) followed by a sequence of zero or more slash-separated elements. For any two export resources associated with the same export set, the path sequence for the first export resource can’t contain the complete path element sequence of the second export sequence. Paths can't end in a slash. No path element can be a period (.) or two periods in sequence (..). Lastly, no path can exceed 255 bytes.

Examples:

Acceptable:

`/example` and `/path`

`/example1` and `/example2`

Not Acceptable:

`/example` and `/example/path`

`/` and `/example`

`/example/`

`/example/path/../example1`

To update export options

Open a command prompt and run `oci fs export update`. To update export options for a specified file system, use `--export-options`.

For example:

```
oci fs export update --export-id <export_OCID> --export-options '[{"source":"<0.0.0.0/0>","require-privileged-source-port":"true","access":"READ_ONLY","identity-squash":"ROOT","anonymous-uid":"65534","anonymous-gid":"65534"}]'

WARNING: Updates to export-options will replace any existing values. Are you sure you want to continue? [y/N]: y
```

Tip

If you don't want a file system to be visible to any clients, you can set all of the properties in Client Options to empty values. For example,

```
oci fs export update --export-id <export_OCID> --export-options '[{"source":"","require-privileged-source-port":"true","access":"READ_ONLY","identity-squash":"ROOT","anonymous-uid":"65534","anonymous-gid":"65534"}]'
```

To list exports

Open a command prompt and run `oci fs export list` to list all exports in a specified compartment.

For example:

```
oci fs export list --compartment-id target_compartment_id
```

To delete an export

Open a command prompt and run `oci fs export delete` to delete an export.

For example:

```
oci fs export delete --export-id export_OCID
```

Warning

When you delete an export, you can no longer mount the file system using the file path specified in the deleted export.

Using the API

- CreateExport
- UpdateExport
- ListExports
- GetExport
- DeleteExport

Creating File Systems

You can create a shared file system in the cloud using the File Storage service. Network access to your file system is provided through a mount target. Exports control how NFS clients access file systems when they connect to a mount target. File systems must have at least one export in one mount target for any instance to mount and use the file system. Typically, you create your first mount target when you create your first file system.

Warning

Avoid entering confidential information when assigning descriptions, tags, or friendly names to your cloud resources through the Oracle Cloud Infrastructure Console, API, or CLI.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users create, manage, and delete file systems allows users to create file systems. Since mount targets are network endpoints, users must also have "use" permissions for VNICs, private IPs, private DNS zones, and subnets to create or delete a mount target. See the Policy Reference for more information.

If you're new to policies, see Getting Started with Policies and Common Policies.

Prerequisites

Before you create a file system, you need:

- At least one Virtual Cloud Network (VCN) in a compartment. For more information, see VCNs and Subnets.
- Correctly configured security list rules in the VCN subnet where you plan to create the file system's associated mount target. See Security Lists for information about how security lists work in Oracle Cloud Infrastructure. Use the instructions in Configuring VCN Security List Rules for File Storage to set up security lists for your file systems.

Using the Console

To create a file system

1. Open the navigation menu. Under **Core Infrastructure**, click **File Storage** and then click **File Systems**.

2. In the left-hand navigation, in the **List Scope** section, under **Compartment**, select a compartment.
3. Click **Create File System**.

Note

File systems are encrypted by default. You cannot turn off encryption.

4. You can choose to accept the system defaults, or change them by clicking **Edit Details**.
    - **File System Information:**
        - **Name:**File Storage service creates a default name using "FileSystem-YYMMDD-HHMM". Optionally, change the default name for the file system. It doesn't have to be unique; an Oracle Cloud Identifier (OCID) uniquely identifies the file system.
        - **Availability Domain:** The first availability domain selected in the left panel list is used as default.
    - **Export Information**
      Mount targets use exports to manage access to file systems. The path name uniquely identifies the file system within the mount target, and is used by an instance to mount the file system.
        - **Export Path:** The File Storage service creates a default export path using the file system name. Optionally, replace the default export path name with a new path name, preceded by a forward slash (/). For example, /fss. This value specifies the mount path to the file system (relative to the mount target IP address or hostname). Avoid entering confidential information.

Important

The path must start with a slash (/) followed by a sequence of zero or more slash-separated elements. For multiple file systems associated with a single mount target, the path sequence for the first file system cannot contain the complete path element sequence of the second file system path sequence. Paths cannot end in a slash. No path element can be a period (.) or two periods in sequence (..). Lastly, no path can exceed 255 bytes. For example:

Acceptable:

`/example` and `/path`

`/example` and `/example2`

Not Acceptable:

`/example` and `/example/path`

`/` and `/example`

`/example/`

`/example/path/../example1`

Warning

If one file system associated to a mount target has '/' specified as an export path, you can't associate another file system with that mount target.

Note

Export paths cannot be edited after the export is created. If you want to use a different export path, you must create a new export with the desired path. Optionally, you can then delete the export with the old path.

For more information, see Paths in File Systems.

- **Use Secure Export Options:** Select to set the export options to require NFS clients to use a privileged port (1-1023) as its source port. This option enhances security because only a client with root privileges can use a privileged source port. After the export is created, you can edit the export options to adjust security. See Working with NFS Export Options for more information.

Warning

Leaving the "Use Secure Export Options" setting disabled allows unprivileged users to read and modify any file or directory on the target file system.

- **Mount Target Information:**
  File systems must be associated with a mount target to be mounted by an instance.
  If you have one or more previously created mount targets in the availability domain, the File Storage service automatically chooses the most recently created mount target in the list. If you don't have a mount target in the selected availability domain, the File Storage service creates one using the following defaults.
  - **Mount Target Name:** File Storage service creates a default mount target name using "Mount-YYYYMMDD-HHMM".
  - **Compartment:** The compartment you're currently working in.
  - **Virtual Cloud Network:** The first VCN listed in the current compartment is used as default.
  - **Subnet:** The most recently created subnet listed in the selected availability domain is used as default. Subnets can be either AD-specific or regional (regional ones have "*regional*" after the name). For more information, see About Regional Subnets.

5. If you want to *accept the defaults* for the mount target, click **Create**. *The file system is created with the information displayed*. If you want to choose another mount target or change the default information, click the **Edit Details** link.
6. In the **Mount Target Information** section, specify details for the mount target that is associated with the file system:

- **Select an Existing Mount Target:** Choose this option if you want to associate the file system with a mount target you already created. Choose the **Mount Target** from the list. Click the **click here** link in the dialog box if you want to enable compartment selection for the mount target.

  Tip

  If there aren't any mount targets in the current combination of availability domain and compartment, this option is disabled. You can:

  - Choose a different compartment.
  - Choose a different availability domain in the *File System Information* section.
  - Create a new mount target.

- **Create a New Mount Target:** Choose this option if you want to create a new mount target associated with this file system. By default, the mount target is created in your current compartment and you can use network resources in that compartment. Click the **click here** link in the dialog box if you want to enable compartment selection for the mount target, its VCN, or subnet resources.

Important

The mount target is always in the same availability domain as the file system. While it is possible to access mount targets from any AD in a region, for optimal performance, your mount target and file system should be in the same availability domain as the Compute instances that access them. For more information, see Regions and Availability Domains.

- **Create in Compartment:** Specify the compartment you want to create the mount target in.
- **New Mount Target Name:** Optionally, replace the default with a friendly name for the mount target. It doesn't have to be unique; an Oracle Cloud Identifier (OCID) uniquely identifies the mount target. Avoid entering confidential information.

Note

The mount target name is different than the DNS hostname, which is specified in step 7.

- **Virtual Cloud Network Compartment:** The compartment containing the cloud network (VCN) in which to create the mount target.
- **Virtual Cloud Network:** Select the cloud network (VCN) where you want to create the new mount target.

- **Subnet Compartment:** Specify the compartment containing a subnet within the VCN to attach the mount target to.
- **Subnet:** Select a subnet to attach the mount target to. Subnets can be either AD-specific or regional (regional ones have "*regional*" after the name). For more information, see About Regional Subnets.

Warning

Each mount target requires three internal IP addresses in the subnet to function. Do not use /30 or smaller subnets for mount target creation because they do not have sufficient available IP addresses. Two of the IP addresses are used during mount target creation. The third IP address must remain available for the mount target to use for high availability failover.

7. Optionally, click **Show Advanced Options** to configure the mount target's advanced options.
   - **IP Address:** You can specify an unused IP address in the subnet you selected for the mount target.
   - **Hostname:** You can specify a hostname you want to assign to the mount target.

Note

The File Storage service constructs a fully qualified domain name (FQDN) by combining the hostname with the FQDN of the subnet the mount target is located in.

For example, `myhostname.subnet123.dnslabel.oraclevcn.com`.

Once created, the hostname may be changed in the mount target's Details page. See Managing Mount Targets for more information.

8. Click **Create**.

The File Storage service typically creates the file system and mount target within seconds. Next, mount the file system from an instance so that you can read and write directories and files in your file system. See Mounting File Systems for instructions about obtaining mount commands for your operating system type and mounting your file system.

Using the command line interface (CLI)

For information about using the CLI, see Command Line Interface (CLI).

To create a file system

Open a command prompt and run `oci fs file-system create` to create a file system. For example:

```
oci fs file-system create --availability-domain <target_availability_domain> --display-name "<My File System>" --compartment-id <target_compartment_id>
```

Warning

Avoid entering confidential information in the file system `display-name`.

The file system is created.

To create a mount target

You can create a mount target for file systems in a specified compartment and subnet. A file system can only be associated with a mount target in the same availability domain.

Warning

Each mount target requires three internal IP addresses in the subnet to function. Do not use /30 or smaller subnets for mount target creation because they do not have sufficient available IP addresses. Two of the IP addresses are used during mount target creation. The third IP address must remain available for the mount target to use for high availability failover.

Open a command prompt and run `oci fs mount-target create` to create a mount target.

For example:

```
oci fs mount-target create --availability-domain <target_availability domain> --compartment-id <target_
compartment_id> --subnet-id <subnet_OCID> --display-name "<My Mount Target>"
```

Warning

Avoid entering confidential information in the mount target `display-name`.

To create an export

An export is a file system together with the path that can be used to mount it. Each export resource belongs to one export set.

Open a command prompt and run `oci fs export create` to create an export for a specified file system within a specified export set.

For example:

```
oci fs export create --export-set-id <export_set_OCID> --file-system-id <file_system_OCID> --path
"</pathname>"
```

Important

The path must start with a slash (/) followed by a sequence of zero or more slash-separated elements. For multiple file systems associated with a single mount target, the path sequence for the first file system cannot contain the complete path element sequence of the second file system path sequence. Paths cannot end in a slash. No path element can be a period (.) or two periods in sequence (..). Lastly, no path can exceed 255 bytes. For example:

Acceptable:

`/example` and `/path`

`/example` and `/example2`

Not Acceptable:

`/example` and `/example/path`

`/` and `/example`

`/example/`

`/example/path/../example1`

Warning

If one file system associated to a mount target has '/' specified as an export path, you can't associate another file system with that mount target.

Note

Export paths cannot be edited after the export is created. If you want to use a different export path, you must create a new export with the desired path. Optionally, you can then delete the export with the old path.

For more information, see Paths in File Systems.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations to create file systems:

- CreateFileSystem
- CreateMountTarget
- CreateExport

Mounting File Systems

Users of Unix-style operating systems and Windows Server 2008 R2, 2012 R2, or 2016 can connect to a file system and write files. Mount targets serve as file system network access points for file systems. After your mount target is assigned an IP address, you can use it together with the file system export path to mount the file system. On the instance from which you want to mount the file system, you need to install an NFS client. For Unix-style operating systems, you create a mount point. When you mount the file system, the mount point effectively represents the root directory of the File Storage file system, allowing you to write

files to the file system from the instance. Windows operating systems use a drive letter assignment instead of a mount point to represent root access.

Prerequisites

- The file system must have at least one export in at least one mount target. When you create a new file system, an export for the file system is created at the same time. See Creating File Systems for more information.
- Correctly configured security list rules in the VCN subnet where the file system's associated mount target resides. See Security Lists for information about how security lists work in Oracle Cloud Infrastructure. Use the instructions in Configuring VCN Security List Rules for File Storage to set up security lists for your file systems.

Mounting File Systems From an Instance

Mounting File Systems From Unix-Style Instances (Including Oracle Linux DB instances)

Mounting File Systems From Windows Instances

Obtaining Mount Command Samples

You can use the Console to get mount command samples that include all the information for a specific mount target and file system. Samples are available for the following operating system images:

- Oracle Linux
- CentOS
- Debian
- Red Hat Linux
- Ubuntu

Warning

When mounting file systems, the following mount option combination is **not supported** by the File Storage service:

- `soft` when the file system is mounted with the read/write mount option (`-o rw`). **This combination can cause corruption of your data**.

The following mount options or mount option combinations are **not recommended** for use with the File Storage service:

- `soft` when the file system is mounted with the read-only mount option (`-o ro`) and the `timeo` has been specified as less than `300` seconds. **This combination can cause a profusion of I/O error responses.**
- `nolock`, `rsize`, or `wsize`. **These options cause issues with performance and file locking.**

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users create, manage, and delete file systems allows users to obtain mount commands.

If you're new to policies, see Getting Started with Policies and Common Policies.

Using the Console

To get mount command samples

1. Open the navigation menu. Under **Core Infrastructure**, click **File Storage** and then click **File Systems**.
2. In the **List Scope** section, select a compartment.
   The Console displays a list of file systems that have already been created in the compartment, if any.
3. Find the file system you want to mount, click the Actions icon (three dots), and then click **View File System Details**.
4. In **Resources**, click **Exports**.
5. Find the export in the mount target you want to use to mount the file system, click the Actions icon (three dots), and then click **Mount Commands**.

Tip

To be sure that you select the correct export, check the following:

- **The export path:** This path uniquely identifies the file system within the mount target. No two exports in a mount target can have the same export path, even if the exports are for the same file system.
- **The mount target name:** File systems can be exported through more than one mount target. Be sure that you've selected the export for the correct mount target.

6. In **Image**, choose the image of the Compute instance you want to mount the file system to.
7. Click the **Copy** link to copy the commands.

Next, mount the file system from a Unix-style or Windows instance.

Mounting File Systems From Unix-Style Instances

Users of Ubuntu and Linux operating systems can use the command line to connect to a file system and write files. Mount targets serve as network access points for file systems. After your mount target is assigned an IP address, you can use it together with the export path to mount the file system. On the instance from which you want to mount the file system, you need to install an NFS client and create a mount point. When you mount the file system, the mount point effectively represents the root directory of the File Storage file system, allowing you to write files to the file system from the instance.

Prerequisites

- The file system must have at least one export in at least one mount target. When you create a new file system, an export for the file system is created at the same time. See Creating File Systems for more information.
- Correctly configured security list rules in the VCN subnet where the file system's associated mount target resides. See Security Lists for information about how security lists work in Oracle Cloud Infrastructure. Use the instructions in Configuring VCN Security List Rules for File Storage to set up security lists for your file systems.

Mounting File Systems

You can use the following instructions to construct your mount commands, or use the Console to get mount command samples that include all the information for a specific mount target and file system. For more information, see To get mount command samples.

Warning

When mounting file systems, the following mount option combination is **not supported** by the File Storage service:

- `soft` when the file system is mounted with the read/write mount option (`-o rw`). **This combination can cause corruption of your data**.

The following mount options or mount option combinations are **not recommended** for use with the File Storage service:

- `soft` when the file system is mounted with the read-only mount option (`-o ro`) and the `timeo` has been specified as less than `300` seconds. **This combination can cause a profusion of I/O error responses.**
- `nolock`, `rsize`, or `wsize`. **These options cause issues with performance and file locking.**

To mount a file system from Ubuntu or Debian

1. Open a command window. Then, get the NFS client by copying and pasting the **Install Command** from the Console or type the following:

   ```
   sudo apt-get install nfs-common
   ```

2. Create a mount point by copying and pasting the **Create Mount Point Command** from the Console or type the following, replacing `yourmountpoint` with the local directory from which you want to access your file system.

```
sudo mkdir -p /mnt/yourmountpoint
```

3. Mount the file system by copying and pasting the **Mount Command** from the Console or type the following. Replace `10.x.x.x:` with the local subnet IP address assigned to your mount target, `fs-export-path` with the export path you specified when associating the file system with the mount target, and `yourmountpoint` with the path to the local mount point. The export path is the path to the file system (relative to the mount target IP address or hostname). If you did not specify a path when you associated the file system and mount target, then `10.x.x.x:/` represents the full extent of the mount target.

Tip

IP address and export path information is available in the **Details** page of the mount target associated with your file system. See To view details of a mount target for more information.

```
sudo mount -o nosuid,resvport 10.x.x.x:/fs-export-path /mnt/yourmountpoint
```

Warning

Omitting the `-o nosuid` option may allow unprivileged users to escalate their permissions to 'root'. The `nosuid` option disables set-user-identifier or set-group-identifier bits within the mounted system, which are rarely used.

Note

The `-o resvport` option is required when the "Require Privileged Source Port" export option is used and otherwise optional. It causes the mounting filesystem to connect from a privileged source port (1-1023). See Working with NFS Export Options for more information.

4. View the file system.

```
df -h
```

5. Write a file to the file system by typing the following. Replace `yourmountpoint` with the path to the local mount point and `helloworld` with your file name.

```
sudo touch /mnt/yourmountpoint/helloworld
```

6. Verify that you can view the file by typing the following. Replace `yourmountpoint` with the path to the local mount point.

```
cd /mnt/yourmountpoint
```

```
ls
```

See Mount Command Fails in Troubleshooting Your File System for more information about common issues you may encounter.

To mount a file system from Linux, Red Hat, or CentOS

1. Open a command window. Then, get the NFS client by copying and pasting the **Install Command** from the Console or typing the following:

```
sudo yum install nfs-utils
```

2. Create a mount point by copying and pasting the **Create Mount Point Command** from the Console or type the following, replacing `yourmountpoint` with the local directory

from which you want to access your file system.

```
sudo mkdir -p /mnt/yourmountpoint
```

3. Mount the file system by copying and pasting the **Mount Command** from the Console or type the following. Replace `10.x.x.x:` with the local subnet IP address assigned to your mount target, `fs-export-path` with the export path you specified when associating the file system with the mount target, and `yourmountpoint` with the path to the local mount point. The export path is the path to the file system (relative to the mount target's IP address or hostname). If you did not specify a path when you associated the file system and mount target, then `10.x.x.x:/` represents the full extent of the mount target.

Tip

IP address and export path information is available in the **Details** page of the mount target associated with your file system. See To view details of a mount target for more information.

```
sudo mount -o nosuid,resvport 10.x.x.x:/fs-export-path /mnt/yourmountpoint
```

Warning

Omitting the `-o nosuid` option may allow unprivileged users to escalate their permissions to 'root'. The `nosuid` option disables set-user-identifier or set-group-identifier bits within the mounted system, which are rarely used.

Note

The `-o resvport` option is required when the "Require Privileged Source Port" export option is used and otherwise optional. It causes the mounting filesystem to connect from a privileged source port (1-1023). See Working with NFS Export Options for more information.

4. View the file system.

```
df -h
```

5. Write a file to the file system by typing the following. Replace `yourmountpoint` with the path to the local mount point and `helloworld` with your file name.

```
sudo touch /mnt/yourmountpoint/helloworld
```

6. Verify that you can view the file by typing the following. Replace `yourmountpoint` with the path to the local mount point.

```
cd /mnt/yourmountpoint
```

```
ls
```

See Mount Command Fails in Troubleshooting Your File System for more information about common issues you may encounter.

To mount a file system from a Database VM instance

Database VM instances are built on Oracle Linux 6.8, unlike Oracle Linux Compute instances, which run on version 7.4. The NFS Utilities package is pre-installed on DB instances, but the Open Network Computing Remote Procedure Call (ONC RPC) rpcbind utility is disabled by default. Oracle Linux 6.8 does not have systemd, so DB instances are managed differently than OL compute instances. An Oracle DB instance comes with a set of iptables rules that excludes any non-database ports and need to be updated to allow mount target traffic.

1. SSH to the DB system.

```
ssh -i <private_key_path> opc@<db_system_ip_address>
```

2. Start the rpcbind service by typing the following:

```
sudo service rpcbind start
```

3. Use the chkconfig command to enable starting rpcbind service at system startup.

```
sudo chkconfig rpcbind on
```

4. Change the default configuration of iptables to include the mount target IP address and allow traffic by typing the following. Replace `10.x.x.x` with the local subnet address assigned to the mount target for the file system. Save the new iptables entries.

```
sudo iptables -A INPUT -p tcp -s 10.x.x.x -j ACCEPT
```

```
sudo iptables -A OUTPUT -p tcp -s 10.x.x.x -j ACCEPT
```

```
sudo service iptables save
```

5. Create a mount point by typing the following, replacing `yourmountpoint` with the local directory from which you want to access your file system.

```
sudo mkdir -p /mnt/yourmountpoint
```

6. Mount the file system by typing the following. Replace `10.x.x.x:` with the local subnet IP address assigned to your mount target, `fs-export-path` with the export path you specified when associating the file system with the mount target, and `yourmountpoint` with an absolute path to a local mount point. The export path is the path to the file system (relative to the mount target IP address or hostname). If you did not specify a path when you associated the file system and mount target, then `10.x.x.x:/` represents the full extent of the mount target.

Tip

IP address and export path information is available in the **Details** page of the mount target associated with your file system. See To view details of a mount target for more information.

```
sudo mount -t nfs -o nosuid,resvport,tcp,vers=3 10.x.x.x:/fs-export-path /mnt/yourmountpoint
```

Warning

Omitting the `-o nosuid` option may allow unprivileged users to escalate their permissions to 'root'. The `nosuid` option disables set-user-identifier or set-group-identifier bits within the mounted system, which are rarely used.

Note

The `-o resvport` option is required when the "Require Privileged Source Port" export option is used and otherwise optional. It causes the mounting filesystem to connect from a privileged source port (1-1023). See Working with NFS Export Options for more information.

See Mount Command Fails in Troubleshooting Your File System for more information about common issues you may encounter.

To auto-mount a shared file system

Auto-mount ensures that a file system is automatically re-mounted on an instance if it is rebooted.

1. Open a command window. Then, mount the file system using the steps described in the previous section.
2. Type the following command to get the file system entry point:

   ```
   sudo cat /etc/mtab |grep -i nfs
   ```

3. Copy the file system entry point, and open the /etc/fstab file:

   ```
   cd /etc
   ```

   ```
   vi fstab
   ```

4. Add the following line to the fstab file:

   ```
   <file_system_ip_address>:<file_system_path_name><your_local_mount_point> nfs
   defaults,nofail,nosuid,resvport 0 0
   ```

Warning

Omitting the `-o nosuid` option may allow unprivileged users to escalate their permissions to 'root'. The `nosuid` option disables set-user-identifier or set-group-identifier bits within the mounted system, which are rarely used.

Important

Be sure to add the `nofail` option to each entry. This option ensures that an unavailable file system does not cause the instance reboot process to fail.

Note

The `-o resvport` option is required when the "Require Privileged Source Port" export option is used and otherwise optional. It causes the mounting filesystem to connect from a privileged source port (1-1023). See Working with NFS Export Options for more information.

5. Save the fstab file.

See Mount Command Fails in Troubleshooting Your File System for more information about common issues you may encounter.

Mounting File Systems From Windows Instances

Users of Windows Server 2008 R2, 2012 R2, or 2016 can mount a file system on any available drive letter using the mount target IP address and the file system export path.

On the instance from which you want to mount the file system, you need to install the Windows NFS client.

Warning

Installing the Windows NFS client may require a restart of your system.

Access to NFS file systems requires UNIX-style user and group identities, which are not the same as Windows user and group identities. To enable users to access NFS shared resources, Windows client for NFS accesses file systems anonymously, using 'AnonymousGid' and 'AnonymousUid'. On brand new file systems, write permissions are only granted to the root user. The 'AnonymousGid' and 'AnonymousUid' identity values must be changed to allow write access.

Warning

Updating the 'AnonymousGid' and 'AnonymousUid' values require registry changes to your system.

After you have installed the NFS client and correctly mapped user identities, you can mount the file system to any available drive letter using the command line or **Map network drive**. You can access your file system through the chosen drive letter to write files.

Prerequisites

- The file system must have at least one export in at least one mount target. When you create a new file system, an export for the file system is created at the same time. See Creating File Systems for more information.
- Correctly configured security list rules in the VCN subnet where the file system's associated mount target resides. See Security Lists for information about how security lists work in Oracle Cloud Infrastructure. Use the instructions in Configuring VCN Security List Rules for File Storage to set up security lists for your file systems.

Warning

When mounting file systems, the following mount option combination is **not supported** by the File Storage service:

- `soft` when the file system is mounted with the read/write mount option (`-o rw`). **This combination can cause corruption of your data**.

The following mount options or mount option combinations are **not recommended** for use with the File Storage service:

- `soft` when the file system is mounted with the read-only mount option (`-o ro`) and the `timeo` has been specified as less than `300` seconds. **This combination can cause a profusion of I/O error responses.**
- `nolock`, `rsize`, or `wsize`. **These options cause issues with performance and file locking.**

Using Windows Command Prompt

To mount a file system from Windows Server 2008 R2 Command Prompt

1. Install Services for NFS components.
    a. Click **Start** go to **Administrative Tools**, then click **Server Manager**.
    b. In the left pane, click **Roles**.

c. Under **Roles Summary** in the right pane, click **Add Roles**. The **Add Roles Wizard** appears. Click **Next**.

d. Select the **File Services** check box from the list and click **Next**. Review the information and click **Next**.

e. Select the **Services for Network File System** check box from the list, and click **Next**.

f. Confirm your selections, then click **Install**. Click **Close** when the installation is complete.

2. Open the registry editor (regedit) and map the AnonymousGid and AnonymousUid to the root user.

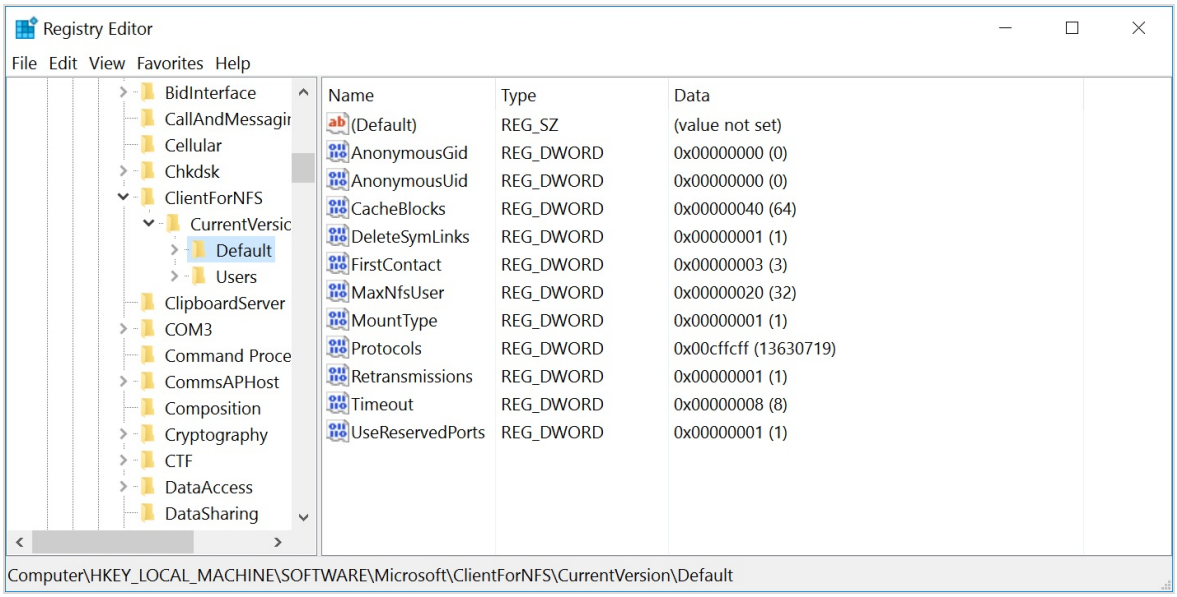
Warning

User identity mapping requires changes to your system registry.

a. Click **Windows Search.**

b. Enter `regedit` in the **Search** field and press **Enter**.

c. Click **Yes** to allow changes to your device.



d. Click `HKEY_LOCAL_MACHINE`. Then, browse to: `Software\Microsoft\ClientForNFS\CurrentVersion\Default`.

3. Add a new DWORD32 registry entry for `AnonymousGid`:

a. Click **Edit**, and select **New DWORD (32 bit) Value**.

b. In the **Name** field, enter `AnonymousGid`. Leave the value at `0`.

4. Repeat step 3 to add a second DWORD32 registry entry named `AnonymousUid` with a value of `0`.

5. Open Windows Command Line (CMD) and run as **Administrator**:
    a. Click **Start** .
    b. Press **Ctrl+Shift** and click **Command Prompt**.
    c. Click **Yes**.

> **Important**
>
> If you've set export options for your file system to require clients to connect from a privileged source port (1-1023), then you must set the **UseReserverdPorts** registry key to **1**.
> For more information, see Working with NFS Export Options.

6. In the Administrator: Windows Command Prompt (CMD) window, restart the NFS Client by typing the following:

```
nfsadmin client stop
```

```
nfsadmin client start
```

7. Close the Administrator: Windows Command Prompt (CMD) window. Open a **standard** Command Prompt Window:
   a. Click **Start**, then click **Command Prompt**.

Important

NFS file systems mounted as Administrator are not available to standard users.

8. In the standard Windows Command Line (CMD) window, mount the file system by typing the following. Replace `10.x.x.x:` with the local subnet IP address assigned to your mount target, `fs-export-path` with the export path you specified when associating the file system with the mount target, and `X` with the drive letter of any available drive you want to map the file system to.

Tip

IP address and export path information is available in the **Details** page of the mount target associated with your file system. See To view details of a mount target for more information.

```
mount 10.x.x.x:/fs-export-path X:
```

Important

The export path is the path to the file system (relative to the mount target IP address or hostname). If you did not specify a path when you associated the file system and mount target, then "/" represents the full extent of the mount target. In that case, you must use a "!" when mounting the file system. For example: `mount 10.0.0.0:/! X:`

9. Write a file to the file system by typing the following. Replace `X` with the drive letter you used in step 8 and `helloworld` with your file name.

```
X:
```

```
echo > helloworld.txt
```

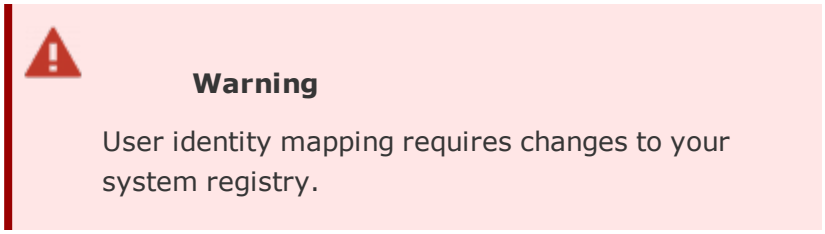
10. Verify that you can view the file by typing the following.

```
dir
```

See Troubleshooting Windows NFS Client Connections for more information on common issues you may encounter.

To mount a file system from Windows Server 2012 R2 or 2016 Command Prompt

1. Open **Windows PowerShell** and run as **Administrator**:
    a. Go to **Start** and click the **Windows PowerShell** icon.
    b. In Windows PowerShell, type the following to run as Administrator:



```
Start-Process powershell -Verb runAs
```

c. In the **User Account Control** window, click **Yes**. A new Administrator: PowerShell window opens. You can close the standard PowerShell window to avoid confusing them.

2. In Administrator: PowerShell, get the NFS client by typing the following:

```
Install-WindowsFeature -Name NFS-Client
```

3. If necessary, restart your system.
4. Open the registry editor (regedit) to map the AnonymousGid and AnonymousUid to the root user.

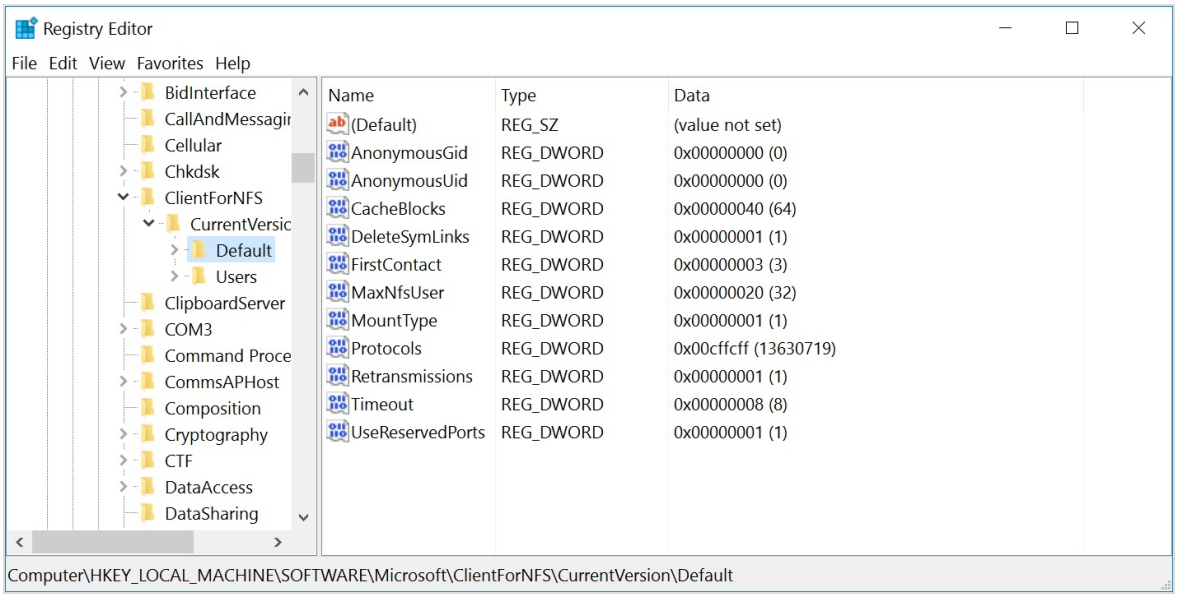
Warning

User identity mapping requires changes to your system registry.

a. Click **Windows Search.**

b. Enter `regedit` in the **Search** field and press **Enter**.

c. Click **Yes** to allow changes to your device.



d. Click `HKEY_LOCAL_MACHINE`. Then, browse to: `Software\Microsoft\ClientForNFS\CurrentVersion\Default`.

5. Add a new DWORD32 registry entry for `AnonymousGid`:

a. Click **Edit**, and select **New DWORD (32 bit) Value**.

b. In the **Name** field, enter `AnonymousGid`. Leave the value at `0`.

6. Repeat step 5 to add a second DWORD32 registry entry named `AnonymousUid` with a value of `0`.

Important

If you've set export options for your file system to require clients to connect from a privileged source port (1-1023), then you must set the **UseReserverdPorts** registry key to **1**.

For more information, see Working with NFS Export Options.

7. Open Windows Command Line (CMD) and run as Administrator:

Tip

To avoid confusion, be sure to close the Windows PowerShell application before opening the Windows Command Line application. The following commands don't work in Windows PowerShell.

a. Go to **Start** and scroll down to **Apps**.

b. In the **Windows System** section, press **Ctrl+Shift** and click **Command Prompt**.

8. In the Windows Command Line (CMD) window, restart the NFS Client by typing the following:

```
nfsadmin client stop
```

```
nfsadmin client start
```

9. Close the Administrator: Windows Command Prompt (CMD) window. Open a **standard** Command Prompt Window:

a. Click **Start**, then click **Command Prompt**.

Important

NFS file systems mounted as Administrator are not available to standard users.

10. In the standard Windows Command Line (CMD) window, mount the file system by typing the following. Replace `10.x.x.x:` with the local subnet IP address assigned to your mount target, `fs-export-path` with the export path you specified when associating the file system with the mount target, and `X` with the drive letter of any available drive you

want to map the file system to.

Tip

IP address and export path information is available in the **Details** page of the mount target associated with your file system. See To view details of a mount target for more information.

```
mount 10.x.x.x:/fs-export-path X:
```

Important

The export path is the path to the file system (relative to the mount target IP address or hostname). If you did not specify a path when you associated the file system and mount target, then "/" represents the full extent of the mount target. In that case, you must use a "!" when mounting the file system. For example: `mount 10.0.0.0:/! X:`

11. Write a file to the file system by typing the following. Replace `X` with the drive letter you used in step 10 and `helloworld` with your file name.

```
X:
```

```
echo > helloworld.txt
```

12. Verify that you can view the file by typing the following.

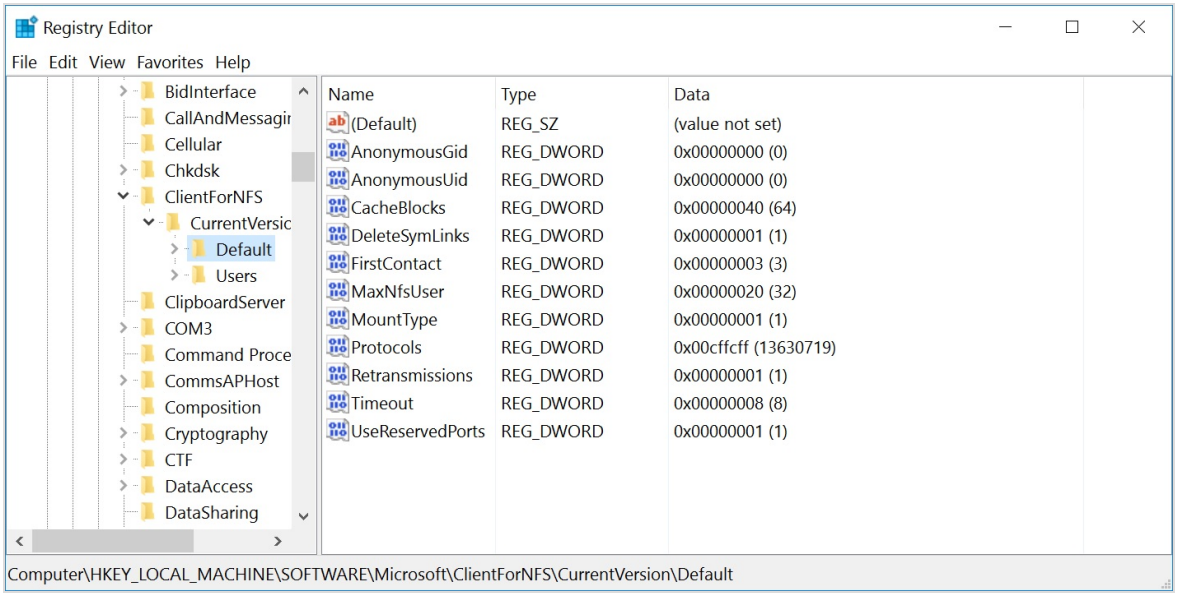
```
dir
```

See Troubleshooting Windows NFS Client Connections for more information on common issues you may encounter.

Using Windows File Explorer

To mount a file system from Windows Server 2008 R2 File Explorer

1. Install Services for NFS components.
    a. Click **Start** go to **Administrative Tools**, then click **Server Manager**.
    b. In the left pane, click **Roles**.
    c. Under **Roles Summary** in the right pane, click **Add Roles**. The **Add Roles Wizard** appears. Click **Next**.
    d. Select the **File Services** check box from the list and click **Next**. Review the information and click **Next**.
    e. Select the **Services for Network File System** check box from the list, and click **Next**.
    f. Confirm your selections, then click **Install**. Click **Close** when the installation is complete.
2. Open the registry editor (regedit) to map the AnonymousGid and AnonymousUid to the root user.



Warning

User identity mapping requires changes to your system registry.

    a. Click **Windows Search.**
    b. Enter `regedit` in the **Search** field and press **Enter**.
    c. Click **Yes** to allow changes to your device.

d. Click `HKEY_LOCAL_MACHINE`. Then, browse to: `Software\Microsoft\ClientForNFS\CurrentVersion\Default`.

3. Add a new DWORD32 registry entry for `AnonymousGid`:
   a. Click **Edit**, and select **New DWORD (32 bit) Value**.
   b. In the **Name** field, enter `AnonymousGid`. Leave the value at `0`.
4. Repeat step 3 to add a second DWORD32 registry entry named `AnonymousUid` with a value of `0`.

> **Important**
>
> If you've set export options for your file system to require clients to connect from a privileged source port (1-1023), then you must set the **UseReserverdPorts** registry key to **1**.
> For more information, see Working with NFS Export Options.

5. Open Windows Command Line (CMD) and run as **Administrator**:
   a. Click **Start** .
   b. Press **Ctrl+Shift** and click **Command Prompt**.
   c. Click **Yes**.
6. In the Administrator: Windows Command Prompt (CMD) window, restart the NFS Client by typing the following:

```
nfsadmin client stop
```

```
nfsadmin client start
```

7. Open **File Explorer** and select **Computer**. Click the **Map network drive** tab.
8. Select the **Drive** letter that you want to assign to the file system.
9. In the **Folder** field, enter the following. Replace `10.x.x.x` with the local subnet IP address assigned to your mount target, and `fs-export-path` with the export path you specified when associating the file system with the mount target.

Tip

IP address and export path information is available in the **Details** page of the mount target associated with your file system. See To view details of a mount target for more information.

```
\\10.x.x.x\fs-export-path
```

Important

The export path is the path to the file system (relative to the mount target IP address or hostname). If you did not specify a path when you associated the file system and mount target, then "\" represents the full extent of the mount target. In that case, you must use a "!" when entering the file system folder path. For example: `\\10.0.0.0\!`

10. Click the **Finish** button when complete.

See Troubleshooting Windows NFS Client Connections for more information on common issues you may encounter.

To mount a file system from Windows Server 2012 R2 or 2016 File Explorer

1. Open **Windows PowerShell** and run as **Administrator**:
    a. Go to **Start** and click the **Windows PowerShell** icon.
    b. In Windows PowerShell, type the following to run as Administrator:

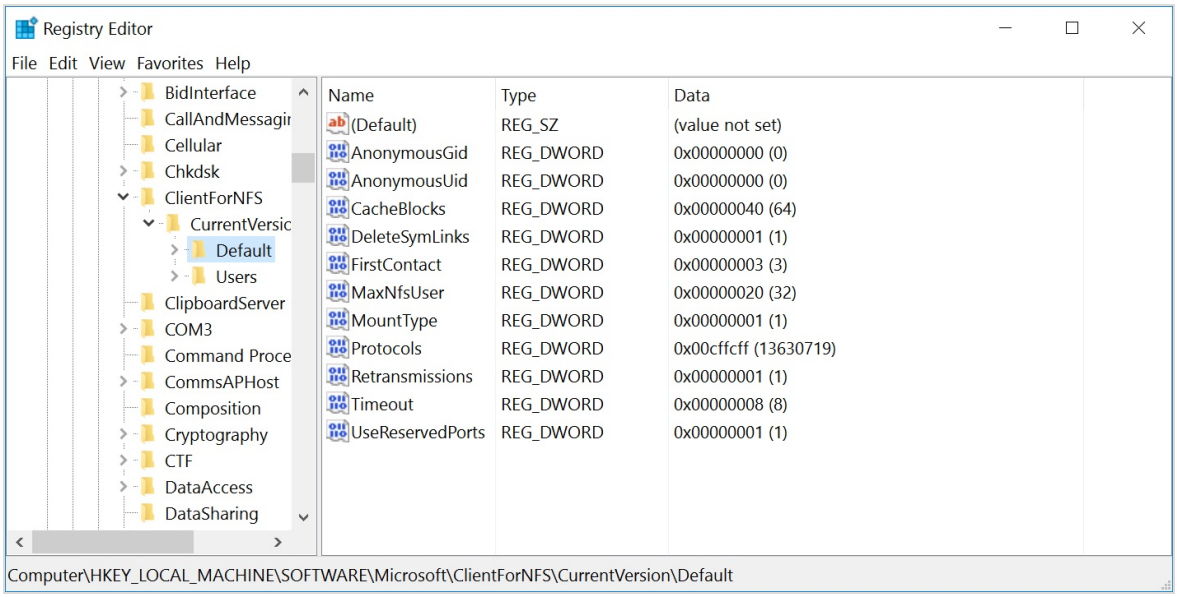
```
Start-Process powershell -Verb runAs
```

c. In the **User Account Control** window, click **Yes**. A new Administrator: PowerShell window opens. You can close the standard PowerShell window to avoid confusing them.

2. In Administrator: PowerShell, get the NFS client by typing the following:

```
Install-WindowsFeature -Name NFS-Client
```

3. If necessary, restart your system.
4. Open the registry editor (regedit) to map the AnonymousGid and AnonymousUid to the root user.



Warning

User identity mapping requires changes to your system registry.

a. Click **Windows Search.**
b. Enter `regedit` in the **Search** field and press **Enter**.
c. Click **Yes** to allow changes to your device.
d. Click `HKEY_LOCAL_MACHINE`. Then, browse to: `Software\Microsoft\ClientForNFS\CurrentVersion\Default`.

5. Add a new DWORD32 registry entry for `AnonymousGid`:
   a. Click **Edit**, and select **New DWORD (32 bit) Value**.
   b. In the **Name** field, enter `AnonymousGid`. Leave the value at `0`.
6. Repeat step 5 to add a second DWORD32 registry entry named `AnonymousUid` with a value of `0`.

Important

If you've set export options for your file system to require clients to connect from a privileged source port (1-1023), then you must set the **UseReserverdPorts** registry key to **1**.

For more information, see Working with NFS Export Options.

7. Open Windows Command Line (CMD) and run as Administrator:
   a. Go to **Start** and scroll down to **Apps**.
   b. In the **Windows System** section, press **Ctrl+Shift** and click **Command Prompt**.
8. In the Windows Command Line (CMD) window, restart the NFS Client by typing the

following:

```
nfsadmin client stop
```

```
nfsadmin client start
```

9. Open **File Explorer** and select **This PC**. In the **Computer** tab, select **Map network drive**.
10. Select the **Drive** letter that you want to assign to the file system.
11. In the **Folder** field, enter the following. Replace `10.x.x.x` with the local subnet IP address assigned to your mount target, and `fs-export-path` with the export path you specified when associating the file system with the mount target.

Tip

IP address and export path information is available in the **Details** page of the mount target associated with your file system. See To view details of a mount target for more information.

```
\\10.x.x.x\fs-export-path
```

Important

The export path is the path to the file system (relative to the mount target IP address or hostname). If you did not specify a path when you associated the file system and mount target, then "\" represents the full extent of the mount target. In that case, you must use a "!" when entering the file system folder path. For example: `\\10.0.0.0\!`

12. Click the **Finish** button when complete.

See Troubleshooting Windows NFS Client Connections for more information on common issues you may encounter.

Managing File Systems

In the File Storage service, file systems are associated with a single compartment. When you select a compartment, the Console displays all file systems in the compartment. You can also see exports and snapshots associated with each file system. If there are no file systems in the compartment, see Creating File Systems for instructions about creating one.

The compartment has policies that indicate what actions a user can take to manage file system. UNIX permissions control what actions a user can take on the files stored in the file system. See About Security for more information.

Actions you can take to manage a file system include:

- Viewing file system details
- Editing file system settings
- Viewing associated file system resources
- Creating an export for the file system
- Deleting a file system

You can perform most administrative tasks for your file systems using the Console, Command Line Interface (CLI), or API. You can use the Console to list mount targets exporting a specific file system. Use the API or CLI if you want to list all mount targets in a compartment.

To access a file system, it must have at least one export in one mount target. Next, mount the file system from an instance, and then you can create directories and read and write files. For more information about creating an export for a file system, see To create an export for a file system in this topic. For more information about accessing your file system, see Mounting File Systems.

Required IAM Service Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users create, manage, and delete file systems allows users to manage file systems.

If you're new to policies, see Getting Started with Policies and Common Policies.

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Details About Your File System

The file system details page provides the following information about your file system:

File System OCID

Every Oracle Cloud Infrastructure resource has an Oracle-assigned unique ID called an Oracle Cloud Identifier (OCID). You need your file system's OCID to use the Command Line Interface (CLI) or the API. You also need the OCID when contacting support.

Availability Domain

When you create a file system, you specify the availability domain that it resides in. An availability domain is one or more data centers located within a region. You need your file system's availability domain to use the Command Line Interface (CLI) or the API. For more information, see Regions and Availability Domains.

CREATED

The date and time that the file system was created.

COMPARTMENT

When you create a file system, you specify the compartment that it resides in. A compartment is a collection of related resources (such as cloud networks, compute instances, or file systems) that are only accessible to those groups that have been given permission by an administrator in your organization. You need your file system's compartment to use the Command Line Interface (CLI) or the API. For more information, see Managing Compartments.

UTILIZATION

Metered size of the file system that gets updated hourly.

> **Important**
>
> **There can be a delay of up to 1 hour** when reporting file system usage.

RESOURCES

Resources such as exports and snapshots that are associated with the file system are listed here. Click the resource type link to see a list of each individual resource. Each export in the list shows the file system's export path and mount target. You need the export path to mount a file system.

> **Warning**
>
> Avoid entering confidential information when assigning descriptions, tags, or friendly names to your cloud resources through the Oracle Cloud Infrastructure Console, API, or CLI.

Using the Console

To view file system details

The File Storage service displays a list of file systems in each compartment.

1. Open the navigation menu. Under **Core Infrastructure**, click **File Storage** and then click **File Systems**.
2. In the **List Scope** section, select a compartment.
3. To view information about a file system, find the file system, click the Actions icon (three dots), and then click **View File System Details**.

   The Console displays metadata for the file system, exports and snapshots for the file system, and status for the file system and its exports in associated mount targets.

To change the file system name

You can change the display name of the file system.

1. Open the navigation menu. Under **Core Infrastructure**, click **File Storage** and then click **File Systems**.
2. In the **List Scope** section, select a compartment.
3. To view information about a file system, find the file system, click the Actions icon (three dots), and then click **View File System Details**.
4. Click **Rename**.
5. Enter the new file system name, and click **Rename**.

To create an export for a file system

Exports control how NFS clients access file systems when they connect to a mount target. File systems are exported (made available) through mount targets. Each mount target maintains an export set which contains one or many exports. A file system may be exported through one

or more mount targets. A file system must have at least one export in one mount target in order for instances to mount the file system. The information used by an export includes the file system OCID, mount target OCID, export set OCID, export path, and client export options. Typically, an export is created in a mount target when the file system is created. Thereafter, you can create additional exports for a file system in any mount target that resides in the same availability domain as the file system.

1. Open the navigation menu. Under **Core Infrastructure**, click **File Storage** and then click **File Systems**.
2. In the left-hand navigation, in the **List Scope** section, under **Compartment**, select a compartment.
3. Click the name of the file system you want to create an export for, and click **Create Export**.

Note

File systems are encrypted by default. You cannot turn off encryption.

4. You can choose to accept the system defaults, or change them by clicking **Edit Details**.
5. If you want to *accept the defaults* for the mount target, click **Create**. *The file system is created with the information displayed*. If you want to choose another mount target or change the default information, click the **Edit Details** link.
6. In the **Mount Target Information** section, specify details for the mount target that is associated with the file system:
    - **Select an Existing Mount Target:** Choose this option if you want to associate the file system with a mount target you already created. Choose the **Mount Target** from the list. Click the **click here** link in the dialog box if you want to enable compartment selection for the mount target.

Tip

If there aren't any mount targets in the current combination of availability domain and compartment, this option is disabled. You can:

- Choose a different compartment.
- Create a new mount target.

- **Create a New Mount Target:** Choose this option if you want to create a new mount target associated with this file system. By default, the mount target is created in your current compartment and you can use network resources in that compartment. Click the **click here** link in the dialog box if you want to enable compartment selection for the mount target, its VCN, or subnet resources.

Important

The mount target is always in the same availability domain as the file system. While it is possible to access mount targets from any AD in a region, for optimal performance, your mount target and file system should be in the same availability domain as the Compute instances that access them. For more information, see Regions and Availability Domains.

- **Create in Compartment:** Specify the compartment you want to create the mount target in.
- **New Mount Target Name:** Optionally, replace the default with a friendly name

for the mount target. It doesn't have to be unique; an Oracle Cloud Identifier (OCID) uniquely identifies the mount target. Avoid entering confidential information.

Note

The mount target name is different than the DNS hostname, which is specified in step 7.

- **Virtual Cloud Network Compartment:** The compartment containing the cloud network (VCN) in which to create the mount target.
- **Virtual Cloud Network:** Select the cloud network (VCN) where you want to create the new mount target.
- **Subnet Compartment:** Specify the compartment containing a subnet within the VCN to attach the mount target to.
- **Subnet:** Select a subnet to attach the mount target to. Subnets can be either AD-specific or regional (regional ones have "*regional*" after the name). For more information, see About Regional Subnets.

Warning

Each mount target requires three internal IP addresses in the subnet to function. Do not use /30 or smaller subnets for mount target creation because they do not have sufficient available IP addresses. Two of the IP addresses are used during mount target creation. The third IP address must remain available for the mount target to use for high availability failover.

7. Optionally, click **Show Advanced Options** to configure the mount target's advanced options.
    - **IP Address:** You can specify an unused IP address in the subnet you selected for the mount target.
    - **Hostname:** You can specify a hostname you want to assign to the mount target.

Note

The File Storage service constructs a fully qualified domain name (FQDN) by combining the hostname with the FQDN of the subnet the mount target is located in.

For example, `myhostname.subnet123.dnslabel.oraclevcn.com`.

Once created, the hostname may be changed in the mount target's Details page. See Managing Mount Targets for more information.

8. Click **Create**.

Next, mount the file system from an instance so that you can read and write directories and files in your file system. See Mounting File Systems for instructions about obtaining mount commands for your operating system type and mounting your file system.

To set the file system reported size

The File Storage service reports file system capacity as 8589934592 gibibytes (GiB) and 8589934592 gibiinodes (GiI) by default. Sometimes, application installers perform a space requirement check prior to running an installation process but cannot correctly interpret the reported size or reported inodes of the file system. When this occurs, you can define the file system size reported to the operating system by setting the **Reported Size** or **Reported Inodes** value in the file system's mount target. Typically, setting the size to 1024 GiB and the inodes to 1024 GiI permits successful installation.

Important

Changing the **Reported Size** or **Reported Inodes** for a mount target affects all file systems exported by the mount target. **Changing these values does not limit the amount of data you can store.**

1. Open the navigation menu. Under **Core Infrastructure**, click **File Storage** and then click **File Systems**.
2. In the **List Scope** section, select a compartment.
3. Find the mount target you're interested in, click the Actions icon (three dots), and then click **View File System Details**.
4. In **Exports**, click on the mount target name.
5. Click the **Reported Size (in GiB) Edit** or the **Reported Inodes (in Gil)** icon.
6. Enter the maximum free space in gibibytes or the maximum inodes in gibinodes you want the File Storage service to report.
7. Click the **Save** icon.

Important

There can be a delay of up to 1 hour when reporting file system usage, either in the console or by using the `df` command.

To manage tags for a file system

1. Open the navigation menu. Under **Core Infrastructure**, click **File Storage** and then click **File Systems**.

2. In the **List Scope** section, select a compartment.
3. Find the file system you're interested in, click the Actions icon (three dots), and then click **View File System Details**.
4. Click the **Tags** tab to view or edit the existing tags. Or click **Apply tag(s)** to add new ones.

For more information, see Resource Tags.

To delete a file system

You can permanently delete a file system.

Warning

You cannot undo this operation. Any data in a file system is permanently deleted with the file system. Snapshots of the file system are permanently deleted with the file system. You cannot recover a deleted file system or its snapshots.

1. Open the navigation menu. Under **Core Infrastructure**, click **File Storage** and then click **File Systems**.
2. In the **List Scope** section, select a compartment.
3. Find the file system you want to delete.
4. Click the Actions icon (three dots), and then click **View File System Details**.
5. Delete all of the file system's exports:
   - In **Exports**, select the check box for all exports listed, and then click **Delete**.
6. When all of the exports are deleted, click **Delete** to delete the file system.

The file system is deleted immediately, along with all of its snapshots.

Using the Command Line Interface (CLI)

For information about using the CLI, see Command Line Interface (CLI).

To list file systems

Open a command prompt and run `oci fs file-system list` to list all the file systems in a specified availability domain and compartment.

For example:

```
oci fs file-system list --availability-domain <target_availability_domain> --compartment-id <target_compartment_id>
```

To get a specific file system

Open a command prompt and run `oci fs file-system get` to retrieve information about a specific file system.

For example:

```
oci fs file-system get --file-system-id <file_system_OCID>
```

To update a file system

Open a command prompt and run `oci fs file-system update` to update a specific file system's information.

For example:

```
oci fs file-system update --file-system-id <file_system_OCID> --display-name "<New File System Name>"
```

Warning

Avoid entering confidential information in the file system `display-name`.

To create an export for a file system

Exports control how NFS clients access file systems when they connect to a mount target. File systems are exported (made available) through mount targets. Each mount target maintains an export set which contains one or many exports. A file system may be exported through one or more mount targets. A file system must have at least one export in one mount target in order for instances to mount the file system. The information used by an export includes the file system OCID, mount target OCID, export set OCID, export path, and client export options. Typically, an export is created in a mount target when the file system is created. Thereafter, you can create additional exports for a file system in any mount target that resides in the same availability domain as the file system.

Open a command prompt and run `oci fs export create` to create an export for a specified file system within a specified export set.

For example:

```
oci fs export create --export-set-id <export_set_OCID> --file-system-id <file_system_OCID> --path
"</pathname>"
```

Important

The path must start with a slash (/) followed by a sequence of zero or more slash-separated elements. For multiple file systems associated with a single mount target, the path sequence for the first file system cannot contain the complete path element sequence of the second file system path sequence. Paths cannot end in a slash. No path element can be a period (.) or two periods in sequence (..). Lastly, no path can exceed 255 bytes. For example:

Acceptable:

`/example` and `/path`

`/example` and `/example2`

Not Acceptable:

`/example` and `/example/path`

`/` and `/example`

`/example/`

`/example/path/../example1`

Warning

If one file system associated to a mount target has '/' specified as an export path, you can't associate another file system with that mount target.

Note

Export paths cannot be edited after the export is created. If you want to use a different export path, you must create a new export with the desired path. Optionally, you can then delete the export with the old path.

For more information, see Paths in File Systems.

To set the file system reported free space

Some existing application installers perform a capacity check before running an installation process. Sometimes an installation fails because of too much available capacity. The File Storage service currently reports 8 exabytes of available capacity by default for each file system.

Customers can define how much free capacity is reported as available to the operating system.

Open a command prompt and type in the following command:

```
oci fs export-set update --export-set-id <export_set_ OCID> --max-fs-stat-bytes <number_of_bytes>
```

Important

The maximum free space setting affects each export in the export set. Setting the maximum free space does not limit the amount of data you can store.

To delete a file system

You can delete a file system if no non-deleted export resources reference it. Deleting a file system also deletes all its snapshots.

Open a command prompt and run `oci fs file-system delete` to delete a file system.

For example:

```
oci fs file-system delete --file-system-id <file_system_OCID>
```

Warning

You cannot undo this operation. Any data in a file system is permanently deleted with the file system. Snapshots of the file system are permanently deleted with the file system. You cannot recover a deleted file system or its snapshots.

Using the API

For information about using the API and signing requests, see REST APIs and Security Credentials. For information about SDKs, see Software Development Kits and Command Line Interface.

Use the following operations to manage file systems:

- ListFileSystems
- GetFileSystem
- UpdateFileSystem
- DeleteFileSystem

Managing Mount Targets

This topic describes the basics of managing mount targets.

Overview

Actions you can take to manage a mount target include:

- Viewing mount target details
- Obtaining mount command samples
- Creating a new export and file system
- Editing exports and export options
- Change the reported size of exported file systems
- Deleting a mount target

You can perform most administrative tasks for your mount targets using the Console, Command Line Interface (CLI), or API. You can use the Console to list mount targets exporting a specific file system. Use the API or CLI if you want to list all mount targets in a compartment.

Mount Target

A mount target is an NFS endpoint that lives in a VCN subnet of your choice and provides network access for file systems. The mount target provides the IP address or DNS name that is used together with a unique export path to mount the file system. A single mount target can export many file systems. Typically, you create your first mount target and export when you create your first file system. The mount target maintains an export set which contains all of the exports for its associated file systems.

Exports

Exports control how NFS clients access file systems when they connect to a mount target. File systems are exported (made available) through mount targets. Each mount target maintains an export set which contains one or many exports. A file system may be exported through one or more mount targets. A file system must have at least one export in one mount target in order for instances to mount the file system. The information used by an export includes the file system OCID, mount target OCID, export set OCID, export path, and client export options. Typically, an export is created in a mount target when the file system is created. Thereafter,

you can create additional exports for a file system in any mount target that resides in the same availability domain as the file system.

NFS Export Options

NFS export options are a set of parameters within the export that specify the level of access granted to NFS clients when they connect to a mount target. An NFS export options entry within an export defines access for a single IP address or CIDR block range.

For more information, see Working with NFS Export Options.

Limitations and Considerations

- Each availability domain is limited to two mount targets by default. However, you can export up to 100 file systems through each mount target.

  See Service Limits for a list of applicable limits and instructions for requesting a limit increase.

- Each mount target requires three internal IP addresses in the subnet to function. Two of the IP addresses are used during mount target creation. The third IP address must remain available for the mount target to use for high availability failover.
- The File Storage service doesn't "reserve" the third IP address required for high availability failover. Use care when designing your subnets and file systems to ensure that sufficient IP addresses remain available for your mount targets.

Required IAM Policy

To use Oracle Cloud Infrastructure, you must be given the required type of access in a policy written by an administrator, whether you're using the Console or the REST API with an SDK, CLI, or other tool. If you try to perform an action and get a message that you don’t have permission or are unauthorized, confirm with your administrator the type of access you've been granted and which compartment you should work in.

For administrators: The policy in Let users create, manage, and delete file systems allows users to manage mount targets. Since mount targets are network endpoints, users must also

have "use" permissions for VNICs, private IPs, private DNS zones, and subnets to create or delete a mount target. See the Policy Reference for more information.

If you're new to policies, see Getting Started with Policies and Common Policies.

Tagging Resources

You can apply tags to your resources to help you organize them according to your business needs. You can apply tags at the time you create a resource, or you can update the resource later with the desired tags. For general information about applying tags, see Resource Tags.

Details About Your Mount Target

The mount target details page provides the following information about your mount target:

MOUNT TARGET OCID

Every Oracle Cloud Infrastructure resource has an Oracle-assigned unique ID called an Oracle Cloud Identifier (OCID). You need your mount target's OCID to use the Command Line Interface (CLI) or the API. You also need the OCID when contacting support.

CREATED

The date and time that the mount target was created.

AVAILABILITY DOMAIN

When you create a mount target, you specify the availability domain that it resides in. An availability domain is one or more data centers located within a region. You need your mount target's availability domain to use the Command Line Interface (CLI) or the API. For more information, see Regions and Availability Domains.

COMPARTMENT
